of Ramamurtammal, an active pro-abolition devadasi and author of a novel on the evils of the system *Dasigal Mosavalai*, for instance. The author was a reformed devadasi who was active in the movement for abolition. The work is strongly autobiographical and narrative of the trends in the movement. See Mu Ramanurtammal (1936-44) and S Anandhi (1991).

- 34 Copy of the Proceedings of the Darbar Dis 3058/C of 15 dated December 9 1915 *MRP* sf 11 part III
- 35 Take for instance the Bill for the Protection of Minors. This bill was passed in 1914 and authorised magistrates to give custody of minor girls who fear adoption for prostitution to suitable males belonging to the same caste. The custodian would according to this bill be given an allowance decided on by the magistrate towards maintenance of the minor girl (*Krishnapatrika* January 17 1914).
- 36 Letter dated September 8 1927 *Muthulakshmi Reddi Papers* subject file 11 part 2 pp 349-51 (hereafter *MRP* sf 11 2 pp 349-51). At the time that Muthulakshmi entered the scene the Kovai Senguntar Mahajana Sangam was among the most active bodies in the Tamil areas. It was established in 1913 and registered in 1924. The activities of this organisation involved propaganda work in remote villages to reclaim devadasis and their daughters. The Society for the Protection of Minors was formed in Cochin in 1917. In the Andhra areas of the presidency the Andhradesa Kalavanthula Sangham was the most active pro-abolition body.
- 37 This is clear from the extremely subservient attitude that other abolitionists assumed in relation to her. The secretary of the Andhra Kalavanthula Association at Repalle for example tells her 'The whole community has every faith in you that you would earn the worldwide fame of taking away the evils of the community by popularising the marriage system and by taking away every other status with and practices and customs of social life like the other sects of Hindus' [Letter *MRP* sf 11 2 p 380].
- 38 Muthulakshmi Reddi Presidential Address delivered at the seventh Andhra Provincial Women's Conference Ellore November 1933 p 11.
- 39 Extract from untitled speech (?) *MRP* sf 11 2 349-351. In November 1927 Muthulakshmi Reddi proposed a bill in the Madras legislative council to amend section 44 (a) of the Madras Hindu Religious Endowments Act of 1927. She proposed the bill for the enfranchisement of inams; she said in support of the women's associations in this presidency who feel this practice of dedicating young girls or young women to temples for immoral purposes as a slur on Indian womanhood and a great wrong and injustice done to the innocent youth of this country and in response to the incessant demands of the enlightened sections of those aggrieved communities themselves whose rightly developed

moral sense naturally revolts at such a notorious custom prevalent among the unenlightened of their community and who with their persuasive method and educative propaganda work are unable to suppress this vice without further legislation and above all in deference to my own personal conviction that in the cause of humanity and justice we can no longer delay this piece of beneficial legislation a reform by which we can rescue thousands of young innocent children from a life of immorality and vice from life long invalidism suffering disease and death resulting from infection with venereal disease' *Proceedings of the Madras Legislative Council* for November 1927 pp 415-16.

The amendment was introduced and inam lands held by devadasis were enfranchised and converted into ryotwari pattas which conferred independent titles to land. It might be useful at this point to dwell for a while on the western feminist position on prostitution that Butler represented. The crusade against male vice in both America and England began with an opposition to state regulation of prostitution. Like earlier female reform efforts the feminist attack on state regulation reinforced women's self-conscious participation in a distinct female subculture. The feminist campaign also drew hundreds of women into the political arena for the first time by encouraging them to challenge male centres of power. They rejected the prevailing view of fallen women as pollutants of men and depicted them instead as victims of male pollution. From the point of the middle class feminists this entailed a strong identification with the fate of prostitutes. Says Walkowitz 'Prostitution also served as a paradigm for the female condition: it established the archetypal relationship between men and women repeated in a more subtle manner within genteel society' [Walkowitz 1980: 147].

Excerpts from the Statement of the Chairman, Shri Sharad S. Marathe, at the 29th Annual General Meeting held on 29th September, 1995 at Bombay.

“ The decision to privatise SICOM was a recognition of the changing financial and economic scenario in the country; and to enable SICOM to operate effectively in a highly competitive environment. ”

The Changing Role of SICOM :

Since inception, your Company was registered as 'The State Industrial & Investment Corporation of Maharashtra Limited'. At the Extraordinary General Meeting held on 22nd December, 1994, a Resolution was unanimously adopted to change the name to SICOM Limited, and with the necessary approvals from the Company Law Board, the shortened name was adopted with effect from 29th December, 1994.

In the last few years, as a result of concerted efforts on several fronts, we have been able to significantly enlarge our scope of operations, strengthen our financial position and increase our profitability. We now provide a wide

range of financial products, including syndication of loans, managing new issues including listing on OTCEI, underwriting, leasing, etc. In 1994-95, we added two more financial services, namely, bill discounting and corporate loans for periods ranging from one to three years.

State Government's Supportive Attitude :

It is in the context of this qualitative change in the corporate identity of SICOM, that one has to see the State Government's decision to disinvest 51% of its shareholding in your Company. The primary consideration leading to the decision to privatise SICOM was a recognition of the changing financial and economic scenario in the country, and to enable SICOM to operate effectively in a highly

competitive environment and without having to be dependent on funding from the exchequer

I would like to mention here a unique feature of the State Government disinvestment. The entire proceeds from the disinvestment of its shares has been deployed by the Government in your Company as an interest free readjustment loan for a period of five to seven years. This reflects not only the State Government's keen interest in your Company's growth and profitability but also its confidence that its equity in your Company will appreciate sufficiently to compensate for the interest foregone.

SICOM's Highly Satisfactory Performance :

The performance of SICOM for the year ending 31st March, 1995, despite the downward trends in the financial sector, has been highly satisfactory. The total amount of loans sanctioned for various products including equity, leasing assistance, corporate loans and term loans has more than doubled during the year to reach a total of Rs. 535 crore. Disbursements were also correspondingly higher Rs. 412 crore which was an increase of 123% as compared with the previous year. The Company continued to improve its performance in respect of recoveries of outstanding dues of principal and interest. As compared to 1993-94 recoveries at Rs. 259 crore were 35% higher. The net profit for the year was Rs. 27 crore, an increase by 15% over that of Rs. 18.61 crore for the previous year. The EPS rose from Rs. 3.07 to Rs. 4.45. By the end of March 1995, SICOM's asset base had increased to Rs. 735 crore as against Rs. 522 crore a year earlier. This represented a growth of 40% over the cumulative funds deployed up to March, 1994 compared to a growth of 14% in the previous year. **I am happy to inform you that on 25th July, 1995, your Company achieved a landmark when its asset base crossed Rs. 1000 crore.**

Importance of Infrastructure :

The changing industrial culture brought about by the influx of foreign technology as also foreign companies making India their base, has made us realise the importance of creating an infrastructure compatible with the growth trends taking place here. No longer is an entrepreneur satisfied with monetary incentives coupled with passable infrastructure. Instead, his preference is for something at par with what is available in developed and other rapidly developing countries. Towards this end, it is forming a company along with Infrastructure Leasing and Financial Services (ILFS), Housing Development & Finance

Corporation (HDFC) and the Maharashtra Industrial Development Corporation (MIDC) which would undertake to develop infrastructure based projects as also formulate reports on such projects, later to be marketed to companies desirous of setting up such projects. Your company has formed a Joint Venture Company with Mahindra & Mahindra and CIDCO to operate water transport services in and around Mumbai.

SICOM to Promote Further Industrial Growth :

There have been major changes in SICOM's corporate identity in recent years. But your Company's objectives remain the same namely to help ensure the primacy of Maharashtra as the leading industrial State in the Indian Union.

After the elections to the State's Legislative Assembly in March 1995, a new Government assumed office in Maharashtra. I am happy to note that the new Government accords highest priority to maintaining Maharashtra's position as the most favoured destination for investments in the industrial sector and every effort is being made to make the State even more investor friendly. In the matter of attracting Foreign Direct Investments also, it continues to be in the lead. As the State's premier industrial promotional agency, your Company will have a great opportunity to serve Maharashtra's economy by attracting more investments.

Expression of Gratitude :

Before I conclude, I would like to place on record the Board's gratitude to the State Government for its continued support. On behalf of the Board, I would like to thank the IDBI, Small Industrial Development Bank of India, Industrial Reconstruction Bank of India and all the Commercial Banks for their assistance in our promotional efforts. Thanks are also due to all the sister organisations like MIDC, MSFB, MSSIDC, MSFC, MFITRON etc. I would be failing in my duty if I did not express our special gratitude to all the alliance partners but for whose support the process of privatisation would not have been realised so expeditiously. I also place on record the Board's appreciation of the diligent efforts put in by all who work for SICOM.

SHARAD S. MARATHE
CHAIRMAN

Images of the Body and Sexuality in Women's Narratives on Oppression in the Home

Meenakshi Thapan

Based on in depth interviews with middle and upper class women in New Delhi this paper examines the relationship between women's experiences of physical violence and psychological oppression in the home and their perceptions of their bodies and sexuality. The female body is viewed as no more than a 'body-for-others' culturally constructed through media images and through women's internalisation of the gaze of the other. Thus what these women often experience as oppression is related to the denigration of a body image and sexual identity. In conclusion the author poses some questions regarding the possibilities of an autonomous femininity that would in fact enable these women to be free of the oppressive gaze

I

Introduction

IN my work on femininity and culture it became increasingly evident in the course of interviews with middle and upper class women in New Delhi that what I was seeking to understand viz the cultural underpinnings of femininity was impossible without an understanding of women's own perceptions of their femininity.¹ Femininity is created through both the cultural and the personal. Women's experience of everyday life is closely linked to their notions of their bodies and their sexuality seen in relation to an ideal femininity. Their experience of psychological oppression in intimate relationships is therefore often related to their notions of the 'perfect' female body and their own sexuality. In a sense then these women are as much oppressed by the values of a patriarchal society as they are by their partners in intimate relationships.

This paper is an attempt to identify and decipher images of the body and sexuality in urban Indian women's narratives on the nature of physical and psychological oppression. The paper examines different kinds of violence women experience in the home and links some of this experience to women's notions of their bodies and sexuality. At no point in the paper is the argument made that women are responsible for the physical battering and psychological torture they experience in the family.

The female body in this paper is viewed as the lived body or the communicative body through which the woman seeks to both define her life spaces and express herself in different situations and contexts in everyday life all of which shape her identity as a feminine being. The body is clearly a medium of culture in the sense in which we take care of it and maintain it eat dress and adorn ourselves communicate with others and so on. However the body as Susan Bordo points out is also more directly a 'practical' locus of social control so that we are in a sense not what we want to be but we are made through culture. Foucault calls the docile body regulated by the norms

of cultural life. It is precisely in the pursuit of an ideal femininity ever-changing and elusive that 'female bodies become docile bodies' [Bordo 1993 165-66]. Thus femininity disempowers us even as it seduces us and like Sandra Lee Bartky (1990:2) I seek to understand how the values of a system that oppresses us are able to take up residence in our minds. This brings us to the question of power as Foucault puts it we need an analysis of power from below. For this Bordo (1993 167) suggests we need to understand the mechanisms that shape and proliferate — rather than repress — desire generate and focus our energies construct our conceptions of normalcy and deviance. This will help us to understand how women collude with forces which often sustain their own oppression.

Women's experiences of oppression or violence in the home are closely linked to their perceptions of their bodies and notions of femininity. In this context the female body appears no more than as a 'body-for-others' socially constructed and therefore under the constant gaze of the other. The internalisation of representations of the female body by women appears to be fundamental to the formation of feminine identity. But this does not happen in a straightforward manner. It is only by mapping the way in which the body circumscribes subjectivity² that we can begin to understand how gender is constitutive of identity [McNay 1991 131]. In the women's narratives we discover that the body is continuously perceived as both defining and limiting a woman's identity by both the perpetrators of the violence as well as by women themselves. It is in this sense that, in intimate relationships, the other's definitions of the body are often experienced as painful and oppressive as they are not congruent with women's own perceptions of their bodies and identities.

The visual and print media in any culture influences women's perceptions through the imaging of the 'perfect' or 'desirable' female body. Images of women who look youthful, have flawless skin beautiful faces and bodies are presented to the urban Indian woman

With the advent of television and the printed word in an increasingly modern urban India the rules for femininity have come to be culturally transmitted more and more through standardised visual images [Bordo 1993 169]. Thus we learn the rules directly through bodily discourse through images that tell us what clothes body shape facial expression movements and behaviour are required (ibid). Some of these images are presented to us through advertisements through fashion through beauty contests and their icons the fashion models through women's magazines and so on. Cable television in urban India has brought home the obsession with the perfect female body in the west through commercials talk shows soaps etc many of which address the perfectability of the feminine form in one way or another.³ The concern with what is considered excessive weight and with the shapely female body which emerges in the women's narratives is to a large extent a reflection of what Kim Chernin (1981) has called the 'tyranny of slenderness' in the west.

This paper also seeks to examine the different forms of psychological oppression women experience both in intimate relationships as well as in relations with the extended family in the home. Psychological oppression or what women themselves refer to as mental torture or emotional violence has not been sufficiently documented because of what is considered lack of evidence. That is, women often do not talk about this aspect of their lives and nor is there any proof of their experience. Precisely for this reason that I sought to examine notions of the body and sexuality drawn from women's experiences of psychological oppression sometimes accompanied by physical violence.

Women's experiences based on everyday life help us to understand the nature of the oppression and violence women encounter. It is absolutely necessary to begin, as Smith (1994 156) points out "with what we know directly in our lives" i.e. with experience. However, it becomes important to remember that although experience does not 'ground

knowledge in any conventional sense, women's experiences and what women say, make important contributions to the creation of knowledge' [Harding 1992 185, 186] While this paper therefore does not offer any major conclusions on the causes of physical and psychological violence on women in the home, it does certainly seek to provide a mapping of the field, as it were. What is the nature of the violence? What forms does it take? How is it related to women's perceptions of their bodies and sexualities? What do women's narratives on oppression, as they experience it, reveal to us?

The analysis is based on material from interview conducted with middle class and upper middle class women in Delhi belonging to different regional and professional backgrounds, varying marital status and with a variety of ideological positions on the family, marriage, and life in general. An attempt was made to identify women from more or less the same kind of social background viz the educated, professional urban woman for purposes of maintaining a certain homogeneity in the collected material. It might thus appear that there is a commonality in the women's narratives that relates both to their experience as well as to their articulation of it. The narratives of women from lower income groups would perhaps contain somewhat different experiences and their articulation would differ from women belonging to the middle classes. One common thread running through all the narratives presented in this paper is that the women were all victims of so-called love marriages rather than the more common-place 'arranged' marriages that are so widely practised in India. Women's experience of violence and psychological oppression in everyday life and especially in the home are not random or isolated experiences. If we connect women's experiences clearly then, what emerges is a flood of common experiences' [Stanko 1985 18] and it is this similarity that shows us the extent and the nature of the humiliation and suffering women experience regardless of their education or status in society.

II Forms of Violence

In my work, I define violence as a form of action or abuse intended to inflict physical or psychological harm on another person. Following Hoff (1990 91) I would further add that the 'meaning of physical acts of aggression cannot be separated from the acts themselves'. It is therefore essential to understand the 'processes and context-specific meanings of violent social interaction including the relationship between verbal and physical aggression'. In this context that women's accounts of psychological oppression become important.

The aim of both physical and psychological violence is the same: the disempowerment of persons which ensures domination over them. As Litke puts it "the genius of violence is that it disempowers in such fundamental ways that its effects cascade out in many directions and for a long time to come" (1992 176). The despair and anguish that many women experience in violent marital relationships is one manifestation of their disempowerment; they can neither terminate the relationship nor change the situation. They simply have to live with it; in fact their survival depends on this. Some women develop suicidal tendencies as well and also feelings of wanting to kill their husbands in order to remove the source of their emotional agony. Even though women may be disempowered, they often perceive themselves as emerging more confident and emotionally stronger from their experience of violence in the home notwithstanding the stress and strain they may have experienced during the crisis. This is certainly true of the women who were interviewed by me. One reason is perhaps their socio-economic background and the fact that they are professionals and economically independent women. It is more likely that women are brutalised and psychologically shattered after their experience if they are economically dependent on their husbands and are not equipped to manage their own lives.

For purposes of analysis, I have categorised the responses of women to violence in the home *vis à vis* their husbands and the extended family into a series of oppositions. The first category of violence in the home is that of verbal abuse as opposed to verbal silence. Verbal abuse takes many forms depending on the context, situation and style of the marriage itself and is often accompanied by physical violence. Withdrawal of sexual activity when the woman may want it as opposed to the imposition of sexual activity on a woman who may not desire it is experienced as another form of violence. The third form is exhibited in the husband's lack of commitment to the home and the family as opposed to an excessive commitment to the family. The latter is evident only in the situation of the 'joint family' where the husband and wife are residing with the husband's parents or/and brothers and their families and the husband is excessively committed to his natal family.

IN NUCLEAR HOME

Violence in the nuclear home is often not visible to an outsider. A woman may be physically battered but continues to go to work hiding her scars, maintaining the facade of her marriage, and carry on her life as though nothing was out of place. A woman may be psychologically oppressed but this

is not always perceived by another person. Stanko has argued that women 'learn to define their worlds and thus their experience as less important than men's'. They tend to internalise and silence many of their experiences of sexual and/or physical intimidation and violation (1985 17). It is only when women may need intervention either through the family or friends or through counsellors that some of these hidden or invisible experiences of violence within the home are revealed. What emerges are narratives by educated, high status women of physical and psychological oppression by their equally well established and successful husbands. What also emerges are notions of the body that are largely defined by the women's partners and undoubtedly affected women's self-esteem and identity as well as their own perceptions of their bodies.

Case I

Leena, a Punjabi kayastha, the daughter of a businessman, is 33 years old and teaches in a university. She has been educated in universities abroad and in India. She married someone of her choice six years ago. They are from different regional communities and have different social, educational and professional backgrounds. Her husband has always pampered her in terms of giving her a lot of attention and always supporting her physical appearance. Even if she had a really bad haircut or wore terrible clothes, he made it a point to appreciate her appearance. Leena thinks they had very good communication and they spoke in a private language, always so no one could really understand what they were saying to each other. Much of this private language was baby talk. As Leena puts it, with one partner becoming parent to the other. Sometimes this frightened her as they could not communicate in any other language. He expressed his affection physically as well, cuddling her often and hugging her even in front of friends. All this fell apart about 10 months ago when he met another woman. Leena now says, 'Maybe now he's grown up, of course at my expense'.

The regional backgrounds of the partners and the caste, class and community to which they belong inevitably affects the nature of their interaction despite the similar educational and professional backgrounds. One outcome of Leena's deteriorating relationship with her husband is the negative nature of his comments about her family and about herself. He has started criticising me physically and comments which are derogatory about my family. That is, the stereotype of being loud, rotund, money-minded, excessive in every sense. They're non-creative, speak loudly to their wives, they're from a particular social class and background. In this case, the comments about Leena's family (essentially her

brothers and their wives) are really directed at a Punjabi business community from her educated westernised Bengali husband

Comments about Leena's body are rather specific. 'How I'm not that attractive. I'm short. I have a bigger head [not in proportion to the rest of her body]. I'm fat, and so on. In a relationship it bothers me that someone who had pampered me so much should switch over so suddenly'. Leena sees these derogatory comments about her body and her family as signs of a marriage gone awry or in her words, a crumbling marriage. Her husband's interest in another woman is one reason she thinks he tries continuously to denigrate her in his own and in her eyes.

Bartky (1990: 23) has argued that both 'fragmentation and mystification' are present in forms of psychological oppression (1990: 23). Bartky defines fragmentation as the 'splitting of the whole person into parts of a person which in stereotyping may take the form of a war between a 'true' and a 'false self' or in sexual objectification the form of an often coerced and degrading identification of a person with her body' (ibid). What Leena in fact experiences as 'mental torture' or emotional violence is the attempt to sexually objectify as well as stereotype her. Degrading comments on her body express an intent to split the whole person into body and mind by focusing on the externally visible physical body. The woman's identity is therefore perceived in terms of the body and women then begin to see themselves in the same way.

Leena defines her body largely in terms of the shape it is and in terms of her own sexuality. The desire for a perfect body is concealed behind her emphasis on her personality. 'The body for others' is presented as her personality but underneath lies the body for myself. When I see my body in the mirror I should like it. It should be pleasant for me. I don't like to see sagging breasts or have extra flesh on thighs or hips. So I should maintain my body and eat less. Most men don't talk about my body that they find my breasts desirable and ravishing etc. They talk about me as a person. My husband used to talk about my body, before we were married, in letters but not any more. Maybe they don't find it sexy. In my case, it's all hidden but it's all there. I don't dress up to highlight my contours, emphasise my shape, etc. I emphasise more on my personality.

Leena works hard at maintaining her definition of the perfect body by visiting the beauty parlour for facials ('I don't like to see a tired face. I like to see a glowing face in the mirror'), by waxing her legs and arms, by bleaching the hair on her face, by hennaing her hair and by dieting whenever she thinks it is necessary. A duality in feminine consciousness" is produced to the

extent that Leena has internalised the gaze of the other and has become at once the seer and the seen.

As distinct from the different forms verbal abuse may take, there is also the issue of verbal silence which is oppressive for the women who may want to discuss issues and sort out matters. Leena says, "We don't speak about issues that bother us. We never have a fight. We don't throw things at each other. Initially I did but the response was total silence. Total indifference. So I tried to control my anger to be like him - silent, and not get into confrontations, etc. Then I got out of it. Even now, as he says, he 'does not fight'. No issue is discussed in a raised voice; it has to be discussed 'in a non-hysterical manner'. It's a male point of view. Spontaneity has been taken out of my personality. I've started intellectualising, theorising, etc. in the last three years of our marriage.

Leena adopts a coping strategy that will most likely be acceptable to her husband. So she learns to be silent when he is, or analyses and theorises about their relationship when he wishes to do so. She has learnt to cope with the silences in her marriage although she cannot cope in quite the same way with the verbal abuse. She is also emotionally distressed by her husband's lack of interest in her pregnancy or in their expected child. There is no commitment to my pregnancy. I'm not very sure that this guy is going to be around when I have the baby. He doesn't accept the procreation even though we were both not using contraceptives. He should have accepted the baby but he didn't want to take responsibility. So my right to procreate was being questioned. If he was so hassled he should have just used a condom. But he taunted me.

You've had it your way. You wanted a child and you have it. Put he had a choice to prevent it. Secondly, once the child is there, there is no commitment to the child and especially to the relationship. I don't know if the child will have a father or not. This is also a mental torture. He keeps telling me he will leave after the baby is born. He can't walk out on a pregnant woman. Middle class values are supporting this relationship as a facade. It can break any time."

There appears to be a relationship between the way women perceive their mothers' experiences of 'violence' in the home and their own experience of it. Leena perceives a similarity in the way her mother was treated by her father and the manner in which her husband treats her especially in the context of their sexual relationship. She clearly experiences a dissatisfaction with her sexual relationship with her husband and this becomes another source of distress adding to her experience of oppression within the marriage. My father was an alcoholic and withdrew sexually from my mother. So a

similar experience in my marriage becomes a mental torture. It's ironic that I've felt sexually dissatisfied with my husband due to his preoccupation with work. But I couldn't articulate this then because I thought I was perverse. But now because of the problems we're having, I can articulate it. I've had sex [with husband] even when I was tired, etc. but he didn't, it was only at his convenience. That's when I started getting attracted to other men very early in my marriage.

Leena's husband is also prone to excessive drinking and she resents the lack of commitment to the home. In her case, it is the repetition of her experience of an unhappy marriage that is the cause of her 'mental torture'. Mental torture is also not coming home on time, not eating meals on time, a lack of commitment to being home on time. I felt mentally tortured as a child as we never had meals together, my father never came home on time."

Case II

Chhaya, from a family of Bengali brahmins domiciled in Delhi, is 42 years old, divorced and works as an architect. She was married for five years to someone 10 years older than her who manages industrial relations in the private sector. She lives with her parents in Delhi in what she calls a 'shared existence'. Her parents are well educated; her father has been a journalist and her mother taught for many years at a university college.

Chhaya's father-in-law was an engineer and her brother-in-law a doctor who worked abroad for several years before returning to India. Chhaya's real in-laws were in fact this older brother and his wife with whom they lived for a few years after they were married. Chhaya knew her husband for many years before she married him. At that time she did not know him very intimately. 'I never went to bed with him. In our generation people still didn't sleep around'. They had no children. She experienced both physical and verbal abuse in the last 18 months of her marriage. 'He used to hit me - slapping, would hold my hair and bang my head against the bed, against the wall. The violence was sporadic after the first time. There was a long gap as he thought I'd tell people. But my not telling anyone gave him more confidence to hit me'.

In Chhaya's case, her husband had no commitment to her, the marriage or the home. This aspect of his behaviour cannot be comprehended by Chhaya as he pursued her relentlessly before they were married. The partner's suspicion of the woman's infidelity is a recurrent theme in the women's narratives and often the cause of much of physical violence in intimate relationships. A woman's sexuality is seen as being under control only in her marital state. The partner,

however, begins to feel he has no control over the woman's sexuality and therefore feels threatened by her feminine identity and the possibility of an independent sexuality. Chhaya articulates the reasons for the violence: "One reason was my constantly questioning him, 'Why aren't you at home?' He was going to prostitutes and once he was rounded up by the police. In the first six months of our marriage, my brother-in-law and his wife weren't there. But he retained a room on the top floor to get used to my marital status," he used to say. He used to spend most of his time in the room where he had a lot of pornographic magazines. At night sometimes he used to wait for me to fall asleep and then go out. When he came back, I used to want sex but he would push me off the bed. Then he was suspecting me of having affairs all the time with his friends. This used to irritate me. Then I stopped talking and this used to anger him more and actually started the violence. I used to try to retaliate but he would give me a stronger beating. He kept saying that I was mad. I was willing to go to a psychiatrist with him but he was not willing. He was also an alcoholic and in that frame of mind he didn't know when and where he was hitting me."

Her husband's denial of Chhaya's sexuality by refusing to have sex with her when she wants it is one way he expresses his domination over her in addition of course to his physical domination over her body by battering her constantly. In a Foucauldian sense then, power in sexuality asserts itself in absences, as he puts it, through "rejection, exclusion, refusal, blockage, concealment and mask" (Foucault 1990: 83). Suspicion of Chhaya's infidelity and battering her for it is another mode through which her husband seeks complete control over a body which he owns but which he thinks he might lose at some point of time.

Chhaya did not talk about the trauma she was undergoing or her disastrous marriage because of her sense of commitment to her own family and to her marriage. In no way did her silence imply tacit acceptance of the violence she was experiencing. Stanko (1985: 19) suggests that in fact "silence is a way for the powerless to cope with very real situations. Silence is a declaration. Factors such as concern for others, situational helplessness, fear and terror, and perhaps even immobilising depression encourage silence." Chhaya says, "I kept waiting for my cousins' various marriages to be over as I thought my revelation of my own disastrous marriage would spoil their marriages. Also I wanted to be sure I had given him every chance as I had a fiery temper. And I also kept thinking that it would improve. My family also noticed that he was running me down all the time. But they didn't say anything. I thought maybe now I'll tell them that my marriage is bad but because I'm their

only child I thought their world would fall apart. So I kept quiet."

Chhaya tried to end the marriage when she realised that it could no longer continue. But this was not acceptable to her husband who had to end it on his own terms. "The last time when he hit me physically he was drunk. I refused to prepare food for him and some ruff raff he had picked up to drink with. Then he left and I realised this marriage cannot continue. Later I told him this. Then he hit me so hard my head hit the bed rest. I was black and blue. Then I went to office and had to say I had an accident. That day I decided to leave him. It was getting worse and worse. Next time I would have been dead. Finally a cousin of mine got married where my husband misbehaved. He was drinking all the time. He stopped talking to me and then when we were alone told me that I had made eyes at some young boy in the wedding. Then he said that I went to bed with him and suspected my mother and grandmother of endorsing this. This became the truth for him. Then, one day he finally left, picked up a few things and left the house. Then I broke down, crying and then thinking that finally the marriage is breaking down."

All the time she was undergoing physical violence, Chhaya also experienced verbal abuse. She was continuously told that her body was not nice, that she was too fat, that she didn't know anything, and so on. Continuous bodily stereotyping, used to demigrate her and to make her feel ashamed or resentful of her body. "I'm quite conscious about the shape [of her body]. I have weight around the stomach and the hips. I didn't learn swimming because I had to get into a swimsuit. And now at this age I feel like swimming because it helps to keep the body in shape. So I wear loose clothes. I don't want to disregard my femininity but I don't want to be sexy. I want to be appreciated for my mind."

Chhaya's notions of beauty are clearly related to her perception of herself as an aging body and to the fact that she is alone in the world. Her femininity is, therefore, in a sense defined by her perception of herself as a decaying body. "I think women should bother about beauty especially when they are growing old. I would really like to have a pedicure and manicure but don't have the time. I am very fussy about my hair and don't let anyone touch it. One shouldn't put make-up but one should definitely keep one's body and health in good, clean shape. Why should a woman lose her femininity if she is working? My mother had a lovely complexion until a certain age. Suddenly she broke into wrinkles. Supposing she had toned up her muscles, had face massages, and so on, she may not have wrinkled so fast. My job is both walking around sites and also very sedentary. So to keep my body

in shape I do exercises every day and have a massage once a week. I have facials to keep my muscles toned up and in good shape. I know I'm going to be all alone in 20 years. So as far as possible I should be able to take care of myself and have all my limbs functioning."

Mythification in psychological oppression is defined by Bartky as the systematic obscuring of both the reality and agencies of psychological oppression so that its intended effect, the depreciated self, is lived out as destiny, guilt or neurosis. (1990: 23). Women do not however always emerge as victims of oppression but as survivors in a system that views the institution of marriage as the ultimate refuge of a woman. Undoubtedly women experience problems related to both physical and mental health during the crisis but they devise coping strategies and emerge somehow stronger and better equipped to deal with their situation and lives. Therefore the stereotyping and sexual objectification that both Leena and Chhaya have experienced make them victims of psychological oppression but both women are not in any sense disempowered by their experience. For example, Chhaya's experience of physical and psychological violence she says, has made me much more independent than before. I don't accept any kind of interference in my life in everything.

Although it was a horrible experience, I think it's done me a lot of good. Life is not a bed of roses. So one has to put all one's mind to deal with such a situation. It has made me a much stronger person. One has to work to get out of difficult situations oneself. So for any area of my life I have become an expert at coping with disasters! [laughs]

The relationship between sex and violence is acknowledged in most analyses of domestic violence. Marital rape is one form of such violence. In the Indian context Omvedt (1990: 6) argues that "the everyday reality is that doubts about women's 'faithfulness' and efforts to control women's sexuality are major factors in all forms of violence." We may consider Rekha's articulation of the violence she experienced in her marriage, as she put it in terms of a denial of her sexuality.

Case III

Rekha, a Punjabi, is 38 years old, has a Master's degree, and is a school teacher. She lives in a separate apartment in her parents' house in Delhi. Her parents are well-educated and successful people with a superior social standing and status. When she was 22, Rekha married a man who now works in a publishing house. She knew her husband fairly well before she married him (they had a sexual relationship for a couple of years), and is now separated from him. They were married for many years and have one child.

Heartly Greetings on the occasion of the First Diwali in Shivshahi

Shri Manohar Joshi
Chief Minister

Removing darkness
from every mind
And leading us
on the path of light
with a host of Peoples
Welfare Schemes
Diwali is here.

Shri Gopinath Munde
Dy. Chief Minister

Rekindling hopes in
the hearts of the People
and showering flowers
with enthusiasm
Diwali is here.

Rejoicing with ecstasy,
the Shiv Sena - BJP
Alliance reiterates its resolve
To fulfil promises
On the auspicious occasion
of Diwali

Directorate General of Information and Public Relations,
Govt of Maharashtra

Rekha comes across as an independent, successful, and remarkably content woman considering her dissatisfactory marriage.

Her sexual relationship with her husband was 'almost non-existent' and Rekha sees this as being 'prompted' by him. "This is a form of violence because I wanted it [This kind of behaviour] is characteristic of a particular generation of men who have changed or altered their moralities, their world-views. This is, on the one hand, the kind of woman they want to relate to, [i.e., one who is] articulate, independent, aggressive. On the other hand they are scared out of their wits. So, a woman's expression of her sexual rights or her expression of her sexual desire becomes one area of contestation. Its something they can't cope with. It is in part a fear of failure, of an inability to satisfy that [desire]. Being denied any sexual relationship is violence and I experienced this. [The fact that sex] was very occasional and other tensions made it less satisfying. All through our marriage he did have other sexual encounters so I was certainly being denied a satisfying sexual life. It was a gigantic problem in our relationship."

Rekha does not however see this aspect of the violence she experienced in her relationship as being significant in itself. She endured it because, as she says, "we shared a great deal apart from our child. He understood me and I understood him." The breaking point in her marriage came with the appearance of the other woman. His involvement with the other woman for the last year of our marriage broke it up. He inflicted violence on me. I was very hurt by it. It wasn't a moral position I took as he already had other brief sexual encounters. The hurt was heightened because I perceived it as violence. We had a very friendly and interactive relationship in spite of the problems. So the idea that he could continue to do something which was so distressing to me, that was the act of violence, the aggression. He was articulating his preference for the marriage but actually continuing the other relationship so I couldn't carry on any longer. His other relationship was only against me not for itself. It didn't last very long. So it was really an act of violence against me. I always saw it as that."

Rekha's analysis of her problem reflects her own perception of the situation. All three women whose narratives we have heard so far disclose a denial of sexuality in their marital relationships. The question is whether the three men did this consciously to negate the women's self-image or because they felt threatened by the kind of women they had chosen to marry, or simply because they had "fallen out of love" and therefore sought sexual satisfaction elsewhere. It would seem that women's sexuality is one realm in which men felt they could exhibit their power, over

women by denying them what was central to their relationship. In all the three cases the men succeeded in exhibiting this power which was not, however, acceptable to the women for different reasons.

At another level, Rekha articulates her perceptions of her body largely in relation to her sexuality. Her ideal femininity is in fact an ideal sexuality governed however by her body shape. "My sexuality is related to my body. When it is the shape I like then I am relaxed. Being a single woman there is more overt sexual attraction and men are able to express it. So in my attraction to them one element of sexuality is there: a sexual charge, which I feel able to respond to depending on the shape my body is."

In Rekha's case, her husband did not like her weight and as a protest, she says she remained fat all through her marriage. However, she was not immune to his reactions: she realised that her identity was tied up to this image of being slim. She felt that although I was protesting all the time I was also succumbing to it. I wasn't relaxed about it and it affected my sexuality. My husband didn't of course realise what he was doing. As a particularly progressive woman I might say, I am not vulnerable to media images of the body but of course one is. A woman's body is pleasing for herself to have a beautiful body."

Rekha sees herself as being overweight. For the last eight months before I met her she has cut down on food and does room exercises in order to shed weight. She also consciously dresses in a manner that plays down her weight. Rekha has undoubtedly internalised both her husband's perception of her body as well as what she refers to as media images of the female body. This in turn, has affected her sexuality where an ideal sexuality is defined in terms of perfect body weight. The body-for-others has overtaken the body-for-myself but the two are not perceived separately. That is, the body for myself is seen as the signifier for an ideal femininity when in fact it has been subsumed within an overwhelmingly didactic body for others.

However Rekha has not been traumatised by her experience. On the contrary, she has found a certain independence and joy in living alone. "I find living by myself very liberating. I got married at 22. Before that I lived with my parents and was shaping my life with others. So therefore shaping my life for myself has been very nice. I got into many sexual encounters to prove to myself that I was sexually attractive. It [the marriage] didn't erode my sexuality, myself or identity. Had the opposite effect. I could now assert myself in my other relationships. I'm much more uncompromisingly assertive now."

While women may see themselves as survivors and not victims of their

circumstances, clearly at some level, they are aware of the psychological and physical consequences of their experiences. Rekha perceives these in the form of the 'cynicism' that has developed in her. She says, "The big cost in my break up was the view that relationships cannot last. A relationship is much more likely to last if you live separately and see a lot of each other. Its not therefore just that violence could be done to me but that I could equally oppress someone else. So it is the nature of relationships that this could happen."

Similarly Teena is cynical about her relationship and about the element of 'love' and care that had earlier characterised. She has also often imagined pushing her husband off a cliff to be rid of him. Chhaya thinks that its a good thing her marriage ended or she would have either killed her husband or been killed by him.

Sometimes however women who have terminated a relationship perceive in themselves an unfulfilled femininity, as it were. For example Chhaya clearly sees the consequences of her experience of violence and termination of her marriage in terms of a lack of what she calls 'male companionship' and of experiencing her body. Chhaya articulates her needs. "I wish there could be somebody to appreciate my body. In this area I feel I've missed out totally. I've got good relationships, work is good, but only in the area of sex and body its a total blank. I want to fill it up. I must have an experience of my body to know its good. I don't feel the lack of marriage but I do feel the lack of male companionship. I wouldn't mind having an affair."

While these women do cope at one level, i.e. in terms of their ability to manage their lives and careers, they do experience the cynicism and bitterness that is a part of a deteriorating or terminated marital relationship. They may also not be able to reconcile their single existence with their own needs. For example in Chhaya's case, the need for sex and male companionship. While Rekha's uninhibited and liberated lifestyle gave her the freedom to indulge in several sexual encounters, Chhaya was clearly restricted by her own inhibitions and lifestyle which includes long hours at work. To the extent that Chhaya's needs remain unsatisfied, she experiences stress induced by unfulfilled sexual desire.

Sexuality clearly is central to these women's definitions of femininity and they appear to depend to a large extent, on their partners for this aspect of their self-definitions. Lack of sexual interest or desire on the part of the partner is experienced as oppressive and there is no doubt they strive, in different ways. It is only when sexual fulfilment with their partners is denied that they seek fulfilment elsewhere. It would seem that in the nuclear home, women

experience a heightened sexuality as compared to the joint family in which their sexuality appears to be viewed differently due to the oppressive relationship with the in-laws. More on this later.

III

Oppression in Joint Family

In the joint family, women experience psychological oppression and physical violence from either the in-laws or the husband or from both, depending on each situation. The most important point is that despite the social and educational background of the husband's family or their progressive outlook, the woman's identity is expected to merge completely with that of her husband and his family; no differences are to be tolerated. In certain situations, the woman is seen as a slave, to cook, to wash, to clean the house, and also to earn a living and sometimes to sleep with

Case IV

Saloni, a Punjabi khatun, is from an educated background. Her father is a journalist and her mother has been a teacher and a writer. Saloni is married into a family in which she considers her father-in-law more educated and from a more cultured family than her mother-in-law, who comes from a milieu which is more patriarchal. Saloni suggests that such cultures have a distinct notion of how women are to behave and conduct themselves after marriage. She herself is a bright 39-year-old university teacher who has been married for the last eight years. She had known her husband for many years before they were married—he is from community and regional background different from her own. She lived in a joint family for many years and experienced oppression, as she put it, from her mother-in-law. She does not however absolve her husband of any responsibility. The emotional agony she experienced in relating to her mother-in-law is evident in the anguish and despair in her narrative: "The sense of despair I have felt at the way in which she [the mother-in-law] conducted her relationship with me. This has also implicated my husband because I stayed with her despite my oppression because of him."

Saloni articulates the manner in which she was treated by her mother-in-law in the home: "[I experienced] the feeling of being completely unwanted and unacceptable in the way in which I dressed, my manner, the fact that I was from the wrong kind of family, Punjabi, middle class, ordinary folk, and therefore the wrong kind of woman. This is not what she wanted for her son. She had no control over me in the sense that I was already there. She had no control over my time as for a large part of the day I wasn't there. I worked. But actually she had a great

amount of control over me because of the way she continually expressed her displeasure over the way I ate, dressed, used no make-up. She was constantly chipping away at me. If you know what I mean. There was also emotional blackmail as she used her widowhood as a stick over her own son and me.

Saloni perceives this oppression in terms of what was being done to her as an individual and she decided she could not accept it. "In the first three years of my marriage, I was unsure of myself and they just went along fine. The happiness, the euphoria of marriage was there. Later, the clash is more evident when you become part of the family. I was made increasingly aware of my difference in a way in which I was not earlier. In the next two years, I came to realise that this is the way I am. I can't erase myself into nothingness or be anybody else. So I decided to be much less apologetic about my differences."

The situation was eventually resolved by the mother-in-law moving out and going away to another city. However, they continue to meet and spend a fair amount of time together as a family. In the situation of the joint family when the wife experiences violence from the in-laws, the husband is equally involved, although he may not be responsible for the oppression. His commitment to his natal family often overrides his commitment to his wife or he experiences a situation where he is emotionally torn between his wife and his natal family. Saloni's husband, she says, "was deeply affected by this tension. He felt hugely guilty on both counts. It affected him physically; he lost weight and suffered insomnia."

Saloni tends to respond to her husband's comments about her body, which are often made in what she herself calls a joking manner, by worrying whether he is comparing her to the women in his family. She considers these women more elegant, what she calls the "pearls and chiffon set" and the complete opposite of her. If her husband makes a joking reference to her toes, Saloni wonders if he is comparing her feet to his grandmother's feet, which are "very beautiful." Clearly, what is at stake is the threat to Saloni's femininity by an ideal femininity as it were, signified by an elegance which she does not possess. She therefore experiences an inferiorised body in her comparison with what she considers a perfect body, which is also the body of the oppressive other.

The oppressive relationship with her mother-in-law has left a taint, as it were, on the marital relationship, which is no longer ecstatic as it may have been in the early years of the marriage. "The situation is resolved in that it's not there everyday but it's not in the forgotten past either. It's there in the

relationship [between husband and wife]. Having experienced head-on confrontations, it does alter things. The initial euphoria is not there. We are less caring towards each other, less tenderness and so on. Even now, when my mother-in-law comes to stay or we go there, I'm uncomfortable and apprehensive. The subterranean text is always there. This whole scenario, so prolonged, has not made my marriage stronger. To grow together, you also need to grow apart, so that's what we're undergoing now. If my mother-in-law had been a little more graceful, it would have changed things between us."

The distance between the partners as a result of the tension in their lives in the joint family, is also reflected in their sexual relationship. For Saloni, it [sex] is not a predominant thing for me now, either for myself or in my marital state. It doesn't bother me if we're in a sexually inactive state. It's not such a heightened experience as it was initially, but a more tender and gentler experience. It was altered when I found my mother-in-law's presence all pervasive and restraining and restrictive. But now it's not there."

The pressures of joint family existence are such that women tend to feel totally disinterested in sex. Their sexuality is not as strongly defined or central to their feminine being as it is for women in the nuclear family. This comes out even more clearly in the next case.

Case V

Sometimes the husband is influenced by his family and their complaints about his wife and vents his anger on his wife. His anger and the violence against his wife is a result of the frustration he experiences in a situation where he is unable to really manage or handle his own natal family. This is exactly what happened with Sharmila, an upper caste Bengali (kayastha) who is 45 years old, works for the government, and has been married for 15 years to an executive in the private sector. They met through a Bengali theatre group in which they are both very active and she says that she married him "really just to keep the group active." It was falling apart with other people's departures. They lived together with the husband's family and have only very recently moved to a separate, independent home. Sharmila did not hesitate to tell me that the fact that her husband's family belonged to a lower caste (a scheduled caste) was probably responsible for their unreasonable and often violent behaviour. In-laws always tried to play husband against me, just to make me suffer, in-laws used to encourage him to drink, stay out late, etc. I was forced to cook for 13 to 14 people every evening, with separate menus for everyone. Whether I had food or not, no one was bothered

I stopped eating egg and fish so that my husband could eat more. But no one was bothered that I was not eating. That was mental torture. In-laws used to complain about me to husband and he used to believe them and start shouting or hitting me. My mother-in-law used to be very happy when he was shouting at me. And later on, I started complaining but he didn't believe me as I had earlier not complained. I asked in laws to tell one incident in which I actually misbehaved but this could never be stated. My sister-in-law [husband's older brother's wife] abused me and said "You have nowhere to go. We'll kick you out" and no one said anything. My mother-in-law was happy that she said it. This hurt me a lot. Then I told my husband, I'm leaving.

For Sharmila, physical violence from her husband took the form of 'slapping, pulling hair, shoving me out of the room, shutting the door in my face, etc.' and was accompanied by verbal abuse supportive of the complaints by the in-laws. His abuse, both physical and verbal, is also based on his suspicions about his wife's imaginary relationships with other men. Sharmila finds his suspicions about her infidelity 'very insulting'. 'He doubts everybody, colleagues, my sister's husband, that I have relationships with them. This I find very insulting. All the time, he is checking on my movements. When we were living with in-laws, then his mother used to give him all the information. When he gets angry, he hits out. I had to make him believe that whatever you think is not true or correct.'

Her partner's definitions of her femininity as an immoral or promiscuous sexuality undoubtedly affect Sharmila's notions of beauty and self-adornment as well as her ability to interact with friends. 'I used to be fond of dressing and my friends used to love that. Now I don't feel like doing anything or going in front of friends. I feel it does not suit me anymore. Husband is suspicious if I dress up too much or if I am underdressed. I want to keep an apparent balance but I don't want to dress up now, for example, 'bindi'. I've stopped wearing as he always suspects if my bindi has got smudged or fell off.'

Sharmila's domestic chores in the extended family household, her continuous feeling of exhaustion, and lack of sympathetic understanding from her partner has resulted in her very nonchalant attitude towards sex. 'Initially, I used to feel very nice. I was told not to get pregnant by in-laws as their children [i.e. her sisters-in-law's children] were small and they would have had to look after mine as I work in an office. So whenever he came near me I used to feel tense and worried that I should not get pregnant. Now, it is mechanical. I am making chapattis, it is like that. Most of the time, he is sleeping. Just

do it fast and go to sleep. People say it is good for peace of mind, etc.' so I do it. But he is out of station a lot and I don't miss that part either.

In sum then, violence against women is not only restricted to attacks on her body but as Ghadially (1988: 949) puts it, 'more importantly it is a negation of her integrity and personhood'. In fact, as Bartky (1990: 29) points out, psychological oppression is dehumanising and depersonalising: it attacks the person in her personhood. The women's narratives show us how their feminine being is defined largely in terms of their body shapes, their sexuality, and their inability to conduct themselves within the dictates of a normative femininity.

Women too collude with their oppressors by accepting prevailing definitions of femininity and the female body which they translate into their own ideals of femininity so that its oppressive nature remains hidden even to them. There are two aspects to this problem of women allowing patriarchal notions of the feminine form to function from within themselves. The narcissist woman, as Simone de Beauvoir (1961: 300) points out, sees her body not as an 'instrument of transcendence' but as an object meant for another. She internalises the gaze of the other and begins to view her body in the manner in which it is sought to be made desirable and perfect for the other. In other words, she becomes the other in relation to her body.

Moreover, women are helped in the maintaining and beautifying their bodies, and therefore in the perpetuation of their oppression by an extremely competent system of cultural norms and practices that seem to exist for this purpose. This is what Bartky (1990) calls the 'fashion-beauty complex' (1990) with its array of cosmetics, clothes and other paraphernalia which through aggressive advertising through the visual and print media, address the modern urban woman. The narcissist tendency in any woman is only enhanced by this system in which women are both unwittingly and willingly trapped. The question then arises as to whether there is an autonomous, independent femininity which is not geared to the gaze of the other but is an expression of a woman's innermost self? Or do women's attempts to adorn, shape and perfect their bodies reflect a masquerade, a form of resistance to prevailing patriarchal definitions of the female body? Clothing and self-adornment, it is possible, as Baert (1994: 372) suggests, are therefore "positioned not in a closed circuit of self-reflection, but as a calibrated social act with many possible implications. It is in this sense that 'masquerade' is seen as a 'strategic mobilisation and negotiation of gender self-representation in a mise-en-scene of a performativity of gender'" (ibid). In

conclusion, then, it is essential that we explore the possibilities of an autonomous perception, that is not rooted in the other, so that femininity is not only its product but also its source.

Notes

[An earlier version of this paper was presented at a Workshop on 'Femininity, the Female Body and Sexuality in Contemporary Society' organised by the Nehru Memorial Museum and Library, New Delhi from November 1-3, 1994. Revised and different version of the paper have also been subsequently presented at Hofstra University, New York, the South Asian Workshop, University of Chicago, and at the Annual Conference of the Society for the Interdisciplinary Study of Social Imagery, University of Southern Colorado. I am grateful for the encouragement and criticism I received everywhere, all of which helped in the re-working of this paper which is part of a larger study of 'Femininity and Culture' and therefore remains work in progress. I am especially thankful to Carol Breckenridge, Pradeep Jeyannathan and Kirin Narayan for their excellent comments and suggestions. The usual disclaimer applies. I am also very grateful to the women who agreed to be interviewed for the project and revealed their lives, feelings and emotions to me.]

1. The present paper is part of a larger project on the cultural construction and creation of femininity in some urban Indian women in New Delhi. I view the female body as a text of femininity which is culturally coded, socially constructed and inscribed on the body. In India, the dominant religious discourse and cultural practice has a fairly elaborate set of images and norms for an ideal and largely domesticated femininity. The rules for the presentation of bodily self in everyday life are clearly defined and we are socialised into conformity from very early on in life (see, for example, Dubé 1988). I am not going to discuss any of that here as my own work is more directly concerned with the construction of femininity through certain visual bodily images in contemporary India.
2. More contemporary work on the female body includes that of Bartky (1990), Davis (1991), Bordo (1993), Grosz (1994), among others.
3. In this paper, I am not examining Foucault's views on power in any depth and refer to them only to the extent that they inform my perspective on why women experience oppression in relation to their bodies. See Foucault (1975, 1977, 1980, 1982 and 1990) for his discussion of power. See also Cousins and Hussain (1984), Dreyfus and Rubinow (1982), Diamond and Quinby (1988), Sawicki (1991), McNay (1991, 1994), among others, for analyses of Foucault's conception of power.
4. The impact of the media on women's body consciousness in contemporary Indian society is examined by me in a separate paper on the subject.
5. A quick word on why I am studying middle and upper class women in Delhi. I am doing so for two reasons. First, women in this class are a neglected research category in women's studies in India in the sense that it is often assumed that as they are economically privileged, their experience of violence and

conflict in everyday life is less significant than that of women from lower classes. Secondly, these women represent precisely the category of urban Indian women, who, because of their status and position in society, are exposed to an array of visual images of femininity which they have internalised and which informs their femininity. For other, very different, kinds of studies of upper class women in Indian society, see Roy (1975) and Singh (1990), among others.

- 6 Kakar examines the case of lower class women, among other categories, in his study on Indian sexuality (see Kakar 1990:65-84).
- 7 In an excellent paper on the body in consumer culture, Featherstone discusses the performing self and the attention paid to the shaping and perfecting of the personality as a mode of self-presentation. See Featherstone (1991)
- 8 Omvedt raises the important theoretical question of whether violence "necessarily" has a "sexual character, and is sexuality inherently (biologically) linked to force and dominance - or can we locate social and historical factors that determine the nature of such a linkage today?" (1990:6) Rekha, the respondent in my research, who experienced psychological oppression when her husband withdrew sexually from her, sought to answer some of these questions in her interview relating her experience to the sexuality and socialisation of Indian men today

Fertility and Frailty

Demographic Change and Health and Status of Indian Women

Kirsty McNay

While it has become common to infer the social status of women from their demographic characteristics, it is not easy to read demographic progress in terms of declines in mortality and fertility to make unambiguous judgments about trends in women's social standing. This paper attempts to distinguish the comparative contributions of fertility decline and relative status improvement to trends in maternal mortality in India and presents evidence showing that advancement in women's demographic attainment may not necessarily involve improvement in their health and status.

IT is now common practice to infer the social status of women from their demographic characteristics. Yet it is not so easy to read through demographic progress in terms of declines in mortality and fertility, to make unambiguous judgments about trends in women's social standing. This paper investigates some of the issues involved in the context of maternal mortality, an important but as yet relatively neglected component of female mortality. Declines in maternal mortality may occur in the absence of any change in women's relative social standing or health status simply as the mechanical counterpart of fertility decline. This paper attempts to distinguish the comparative contributions of fertility decline and relative status improvement to trends in maternal mortality in India. Evidence is presented which supports the hypothesis that advancement in women's demographic attainment may not necessarily involve improvement in their health and status.

It is well established that throughout the 20th century, the Indian sex ratio has been both masculine and characterised by a process of increasing masculinisation. This has been argued to demonstrate female mortality disadvantage which is claimed to operate via influences associated with poor female social status.

Successive censuses have revealed an overall decline in mortality accompanied by an increase in the population male:female ratio. This may suggest that as the absolute mortality position of both sexes has improved, the relative longevity of women has worsened. Census estimates show a sex ratio (the population ratio of males to females) of 1 047 in 1921, 1 058 in 1941, 1 075 in 1971, 1 070 in 1981 and 1 077 in 1991 [Dyson 1987]. The decline of the ratio between 1971 and 1981 is important since although partly attributed to the deficient 1971 Census coverage which disproportionately underenumerated women, so biasing the 1971 sex ratio upwards, many demographers also take it to convey some moderation of the long term trend of increasing masculinisation. Similarly, demographers point to particularly deficient 1991 Census coverage in certain states as

partially responsible for inflating the 1991 sex ratio [Dyson 1992].

In addition to a significant regionalisation of mortality differentials¹ the age-specificity of differential mortality is also distinct. In 1975, Dandekar (1975) using census-based estimates for all-India, indicated the maintenance of a biologically determined female mortality advantage during the neonatal period throughout 1901-61. However within the age groups 1-4, 5-14, and 35-49 years, he detected a notable deterioration in female relative longevity together with the continuation of greatest mortality vulnerability within the 15-34 years group. These observations signify the prominence of female mortality disadvantage among children and women of reproductive age. In contrast, Mari Bhat (1989) speaks of a decline in excess early age mortality from the end of the 19th century. This he partly attributes to the greater extent of female benefit relative to that of male benefit within this age group derived from the diminished incidence of famine. The diminished incidence of female infanticide is also important. To account for the simultaneous increasing trend of population masculinity, Mari Bhat points to historically modest improvements in female adult mortality.

More recently Dyson's (1987) work shows that levels of early age female mortality still exceed those of males at the national level. However his 1981 Census-based derivations of sex-specific estimates of $q[2]$, the probability of dying before the age of two, indicate a markedly faster rate of post-1960 mortality improvement for females than for males. Dyson also points to the slow convergence of sex-specific early age mortality indicated from India's Sample Registration System (SRS) data. Both census and SRS data suggest that the differential in e_0 , life expectancy at birth, is now small and its direction largely dependent upon the assessment of the magnitude of excess female early age mortality. With regard to mortality at later ages, SRS data reveals a lateral S pattern to male:female age-specific death rates at both the national level and in nearly every state. The female death rate exceeds the male death rate at all age groups below 35-39 years, but the reverse is true for older

age groups. The upwards shifting of the age-specific curve of male to female death rate from the 1970s onwards can be taken to indicate greater mortality gains for females than for males and a progressive lowering of the age at which excess male mortality begins. Dyson's indices of life expectancy from age five demonstrate that from the 1970s onwards, females now outlive males beyond the age of five, whereas in the 1960s this was probably not the case. This is despite the continuation of pronounced yet diminishing female mortality disadvantage during the reproductive years. Thereafter female mortality gains relative to those of males seem to be decisive. These are attributed principally to the earlier deterioration of male mortality relative to female mortality rather than to any rapid progression in female mortality.

MORTALITY DISADVANTAGE AND WOMEN'S SOCIAL STATUS

Many scholars have asserted that important determinants of female mortality vulnerability may be found in intra-household sex-biased allocations of basic resources, such as food and health care which discriminate against females. Such discriminatory influences the extent of exposure to illness and the outcome of illness once it has occurred. Debate has taken place as to the relative significance of nutritional bias and differential use of health care to sex differences in mortality. Recently it seems that authors have highlighted the impact of the latter. Basu (1992) in her study of contrasting cultural groups in a resettlement slum in Delhi declares that differential access to curative health care may be one of the most important determinants of sex differences in mortality.

These determinants of female mortality disadvantage have been argued to reflect gender differences in social status. In this way, female mortality experience and female social status are linked. Importantly, women's mortality disadvantage has largely been taken to be indicative of their poor relative social status and has therefore been viewed as its proxy. Debate has occurred as to the relative importance of economic versus cultural factors in explaining female

GRAPH 1 ESTIMATION OF MATERNAL MORTALITY METHOD 1 URBAN GUJARAT 1983

status. Geographical differences in status have been used to explain India's regional demography and the age-specific patterns discussed above. Some writers perceive demographic patterns as primarily the consequence of economic determinants of female social status, particularly the extent of female participation in the economy. Bardan (1982) and Miller (1981) look to differences in female labour demand in crop cultivation as the motivating factor in status determination. Dyson and Moore (1983) consider the primacy of culture rather than economic structure in determining female social status and they develop the concept of female autonomy. This is taken to define influence in decision making and control over personal and household concerns and resources. They consider autonomy as operating primarily through kinship structure, marriage patterns, residential arrangements and property inheritance and focus on a north/south distinction within India in these variables. Most recently Visaria (1993) rather than concentrating on the conventional measures of women's status such as economic participation and educational attainment has attempted to measure regional variations in female autonomy by questioning women with regard to the extent of their freedom to undertake specific tasks and their frequency of contact with natal kin. Situations resulting in female mortality vulnerability which may be associated with a lack of autonomy identified with any of these concepts could be termed status-determined mortality risk factors.

It seems plausible to argue that the link between female mortality experience and social status may be extended to the dynamic situation in which India's demographic progress in the form of narrowing excess female mortality may be taken to reflect improvement in women's relative social

status. If this is the case, mortality trends can be seen to represent status trends as declines in status-determined mortality risk factors are primarily responsible for improvements in female mortality. Also women's morbidity patterns are likely to mirror mortality patterns as women's health improves is a result of declines in relative as well as absolute levels of sex-selective discriminatory behaviour. Fertility decline may also be seen as indirect evidence of women's status improvement so that once the demographic transition is underway a virtuous circle is implied with respect to changes in women's status and fertility and mortality declines. Status improvement may be associated with diminishing fertility and mortality which then themselves feed into further status improvement. This may well impart some degree of complacency with regard to interventions aimed specifically at improving the social standing of women.

as it suggests automatic improvement merely as an outcome of demographic progress.

Despite the association between women's status and their mortality vulnerability, Dyson has asserted that the recent trend away from excess female mortality may principally be a consequence of demographic transition rather than an advancement in the relative social position of women *per se*. Rather than looking to status-determined mortality risk factors, he focuses upon demographically determined risk factors. Dyson argues that a decline in the latter may have been associated with women's mortality improvement independently of trends in female status. In the face of fertility decline, excess female mortality may be diminished even if relative levels of sex-selective discriminatory behaviour remain unchanged as poor female status persists. As a decline in the number of children per couple enables an increase in the absolute levels of attention per child, such discriminatory practices are less likely to be translated into mortality, instead contributing to increases in the incidence and duration of morbidity. This implies that in more recent times relative female status may be more accurately proxied by women's conditions of health than by their mortality performance.¹ Females' relative morbidity trends may therefore break away from their mortality trends as the health status of women remains frail in the face of their mortality decline, and individuals who may not have survived in an earlier cohort live longer as ill health replaces early death.¹

MATERNAL MORTALITY IN INDIA

These competing hypotheses have been investigated in this study with particular reference to urban maternal mortality. Both urban mortality and maternal mortality seem to have been relatively neglected in the literature to date. However, it has been claimed that maternal mortality would

GRAPH 2 ESTIMATION OF MATERNAL MORTALITY METHOD 1 URBAN GUJARAT 1976

appear to be a primary contributor to the atypical pattern of higher female than male mortality among those aged 15-44 reported in many parts of south Asia [Koenig et al 1988]. More recently it has been asserted that a decline in maternal mortality appears to be the prime reason for the steep fall in mortality observed among women of reproductive ages [Iruwaya Rajan et al 1992]. Nevertheless, India's 1990-91 maternal mortality level has been given as 460 maternal deaths per 1,00,000 live births. This compares with a level of 630 deaths per 1,00,000 live births in Africa and 26 deaths per 1,00,000 live births in developed countries [WHO 1994]. Clearly then, maternal mortality is a significant risk facing Indian women and a key element in their demographic experience.

According to the 9th Revision of the International Classification of Diseases, a maternal death is defined as 'the death of a woman while pregnant or within 42 days of termination of pregnancy irrespective of the duration and the site of the pregnancy from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes' [Abouzahr and Royston 1991]. The possibility of suffering a maternal death is a function of two distinct components. These can be related to the different mortality risk factors described above. First is the probability of being pregnant or having delivered within the last 42 days. This probability will largely be associated with demographically-determined mortality risk factors established by the level of fertility. The maternal mortality rate, the number of maternal deaths per 1,000 women of reproductive age, will capture this component. Second is the probability of dying of pregnancy-related causes once pregnant or recently delivered. The maternal mortality ratio, the number of maternal

deaths per 1,000 live births, will capture this component as it is a measure of mortality risk per birth. The key point here is that the magnitude of this risk per birth may be largely associated with status-determined risk factors especially women's pre-existing health conditions and their access to adequate medical care. However, it is important to note that risk per birth also has a demographically-determined component as a high fertility regime is likely to exhibit high risk births among very young women and older multiparous women. Studies have indicated a J-shaped relationship between maternal mortality associated with various clinical factors and both maternal age and maternal parity.

Fertility decline will operate to reduce maternal mortality via a reduction in the maternal mortality rate by reducing the average number of children born to each woman (i.e. by reducing the incidence of exposure to demographically-determined risk factors). Fertility decline may also operate to reduce maternal mortality via a reduction in the maternal mortality ratio by reducing risk per birth as childbearing is concentrated into lower risk age and parity groups (i.e. by reducing the demographically-determined component of risk per birth). The latter however may even increase as fertility declines as the proportion of high risk primiparous pregnancies to total pregnancies rises [Loudon 1992].

Support for Dyson's hypothesis may be found in the conjunction of a significant decline in the maternal mortality rate with an insignificant decline in the maternal mortality ratio. This would imply that a decline in the average number of children born to each woman had been more important in reducing maternal mortality than a decline in risk per birth. Risk per birth would remain high as status-determined risk factors remain unaffected. These may

continue to elevate both direct and indirect maternal mortalities. Specifically, anaemic women may face significant mortality risk from haemorrhage. Also pre-existing health complaints such as anaemia may be exacerbated by pregnancy and delivery, so that a pregnant woman who died from such a condition may not have died had she not been pregnant. These observations suggest that, in addition to generalised malnutrition, adverse food allocation practices within the Indian household may become critical in resulting in high levels of risk per birth. Similarly, women's lack of autonomy in seeking early access to health care is likely to apply to maternal care and is therefore liable to further augment maternal mortality.

Conversely, the conventional wisdom would find support from evidence showing a significant decline in the maternal mortality ratio. This would imply that a decline in risk per birth brought about by declines in status-determined risk factors associated with improvements in women's relative status had been important in reducing maternal mortality. This effect is assumed to be additional to and independent of any improvement in the demographically-determined component of risk per birth brought about by fertility decline.⁶ A comparison of the trend significance of these two distinct measures of maternal mortality therefore discriminates between the two competing hypotheses of mortality decline.

MATERNAL MORTALITY IN URBAN GUJARAT

Maternal mortality trends have been estimated for urban Gujarat for the period 1970-90.⁷ The need to estimate levels of maternal mortality arises from the gap in India's registration data concerning maternal deaths. Although data on live births and maternal deaths was collected for the years 1970-1971 and 1972 as part of the registrar general's survey on cause of death in rural areas, for years since 1974 publication of this data has been abandoned. Since then, studies have attempted to measure maternal mortality by undertaking field investigations and by using hospital data.⁸ Such studies have indicated varying levels of maternal mortality for India.

The methods used here for estimating maternal mortality trends for urban Gujarat are those developed by Blum and Fargues (1990). These are indirect methods of estimation which employ sex-age-specific mortality rates to project female mortality in the non-childbearing ages and then compare these estimated rates with the actual rates. The methods do not therefore require data on cause of death. SRS data considered to be very nearly complete with respect to the coverage of vital events, has been used.

The first method (method 1) utilises differences in observed and expected ratios

GRAPH 3 ESTIMATED AND TREND MATERNAL MORTALITY RATE: METHOD 1 URBAN GUJARAT 1970-90

GRAPH 4 ESTIMATED AND TREND MATERNAL MORTALITY RATE: METHOD 1 URBAN GUJARAT 1970-90

female male age specific mortality. These ratios are denoted by $i(x)$ and $i(x)$ where c is the mid point of the age group respectively. The method proposed supposes that he change in the observed ratio over the life span will typically follow a particular pattern so that when graphed an anticipated shape is obtained. For India this pattern seems broadly consistent with the differences in female male age specific mortality outlined above. A ratio greater than unity is expected at young age groups and at childbearing ages where female mortality disadvantage is experienced. Elsewhere in consequence of excess male mortality the ratio is expected to be less than unity. Graphically therefore a shape similar to that exhibited by Graph 1 is expected where a peak is seen within the childbearing ages. Making the important assumption that maternal causes predominate among causes of death specific to women aged between 15 and 50 the deviation of the observed age specific female male

mortality ratio $i(x)$ from the expected ratio $i(x)$ can be taken as a measure of maternal mortality. $i(x)$ is estimated by linear interpolation between the values of $i(x)$ observed just before (10-14 years) and just after (50-54 years) the childbearing period. This assumes that in the absence of maternal deaths the ratio of female to male mortality changes linearly. To estimate total maternal mortality each age specific value has been weighted against the proportion of women in that age group and summed.

For most years the data yields relationships of the expected shape. However, for certain years a peak in the observed ratio occurs at the 10-14 years age group rather than in the later childbearing years. An example is shown in Graph 2. This has implications for the magnitude of the maternal mortality estimates for these years and therefore affects the estimated trends in both measures of maternal mortality. Such patterns bias downwards the estimates because $i(x)$ is greater than $i(x)$

in many age groups following the high value of $i(x)$ at the 10-14 years age group at which the linear interpolation is started. For these age groups the mortality estimates therefore have to be assumed to be zero. In these cases the method was repeated with the linear interpolation beginning at the age group 5-9 years. Estimation of maternal mortality was started from the value of the deviation between $i(x)$ and $i(x)$ at age mid point 17 as before because the deviation before this age group cannot be classified as maternal mortality. This modification shifts downwards the gradient of the linear interpolation so that more of any excess female mortality indicated during the childbearing ages is captured as maternal mortality.

Both the trend in the maternal mortality rate and the maternal mortality ratio with and without the modification are negative. Those values obtained with the modification have been plotted as Graphs 3 and 4. Regression analysis indicates that in the modified case the trend in the maternal mortality rate is statistically significant (t statistic = 3.375) whereas the trend in the maternal mortality ratio is statistically insignificant (t statistic = -1.071). For the unmodified case the mortality ratio trend remains insignificant (t statistic = -0.732) and the mortality rate trend is also insignificant (t statistic = -1.545). It seems therefore that the alternative use of age mid point seven in this method does transform a statistically insignificant trend into a significant one in the case of the maternal mortality rate. The results therefore demonstrate some degree of sensitivity to the modification. Examination of the statistical values obtained from the second method of estimation will shed some light upon the comparability of the trend significance of the mortality rate obtained using the modification.

The second method of estimation uses logarithms of the age specific female mortality rate. In this method it is assumed that in the absence of maternal mortality this mortality schedule follows a Gompertz distribution. In the case of women in high mortality regimes a discontinuity can be observed at the end of the childbearing period i.e. at the age group 50-54 years. This discontinuity can be contrasted with a greater regularity of the age specific male mortality schedule, which follows the Gompertz distribution from a younger age group, and from which deviations are more regular. It is therefore assumed that in the absence of maternal mortality there would be no deviation at the age group 50-54 years in the female mortality schedule. Estimates of female mortality rates in the absence of maternal mortality are therefore provided by backward extrapolation of the logarithms of the female mortality rates observed at the age group just beyond the childbearing period, i.e. the 50-54 years age group, and above back to the age group just before the

GRAPH 5 ESTIMATED AND TREND MATERNAL MORTALITY RATE METHOD 3 URBAN GUJARAT 1970-90

GRAPH 6 ESTIMATED AND TREND MATERNAL MORTALITY RATE METHOD 3 URBAN GUJARAT 1970-90

childbearing period, i.e., the 10-14 years age group. Two different extrapolation rules have been used. Total maternal mortality has been estimated as before.¹

For the first extrapolation rule, regression analysis indicates that the trend in the maternal mortality rate is statistically significant (t -statistic = -2.889) and the trend in the maternal mortality ratio is statistically insignificant (t -statistic = -0.976). Similarly, the trend in the maternal mortality rate obtained from the second extrapolation rule yields a statistically significant t -statistic (= -3.111) while the t -statistic for the trend in the maternal mortality ratio is insignificant (= -1.262). Comparison with the statistical values obtained from method 1 suggests that the use of the modification in that method yields results that are consistent with those obtained from the logarithm methods. Its use may therefore be argued to improve the accuracy of the maternal mortality estimates derived from method 1.

Both methods suggest that the conjunction of a significant decline in the maternal mortality rate with an insignificant decline in the maternal mortality ratio has taken place for urban Gujarat. This allows some tentative propositions to be forwarded concerning the relative viability of the two competing hypotheses of female mortality decline to the Indian experience. The difference in trend significance of the two measures of maternal mortality implies that a decline in the average number of children born to each woman may have been more important in reducing maternal mortality than a decline in risk per birth. This observation seems more consistent with Dyson's hypothesis than with the alternative hypothesis of mortality decline. It is compatible with Dyson's argument that more favourable mortality performance may occur independently of any advancement in the relative status of women. This takes place as status (as well as demographically)

determined risk factors contributing to maternal mortality vulnerability fail to improve as fertility declines.²

CONCLUSION

The Dyson hypothesis of mortality decline is not the more optimistic of the two and the support for it found here reinforces the suspicion that the health status of Indian women may well have remained frail in the face of their mortality decline. Despite fewer household members persistently poor female status dictates that girls and women continue to be less well fed and receive less timely medical attention than boys and men so that smaller family size alone mitigates against the grim association between longevity and poor status. For girls and women therefore frailty may well replace early death. This assumes that the increase in the absolute share of resources allocated to girls and women within a smaller family is sufficient to exceed a threshold level at which the same level of relative discrimination within a larger family is translated into female mortality vulnerability. More females therefore remain alive in the declining fertility regime but they are more likely to suffer from health frailty.

For expectant mothers that frailty means that the risks of pregnancy and childbirth remain high even if confronted less frequently. These observations suggest that in addition to fertility decline safe motherhood in India requires a strengthening of the health and well-being of Indian women long before they are exposed to maternity. Pregnancy and delivery themselves will thereby become safer events so that risk per birth, in addition to the frequency of exposure to that risk, is lessened. It may be that this can be achieved only through a more fundamental change in women's social position so that the discriminatory practices currently serving to keep maternity hazardous disappear at last.

Notes

1. Relative female scarcity shows much internal variation. High and increasing male:female ratios are concentrated in the north and west particularly in Uttar Pradesh, Gujarat and Madhya Pradesh. A pattern of masculinisation below the national mean predominates in the south notably Kerala, Tamil Nadu and Andhra Pradesh.
2. The notion of mortality enhancing risk factors is taken from Alter and Riley's work on mortality decline in historical and contemporary developed countries [see Alter and Riley 1989].
3. Jeffery and Jeffery (1983) however note the increasing importance of family sex composition in determining the extent of intra-household discrimination as desired family size declines within the context of continued on preference. They claim that the number of surplus daughters facing discrimination will increase as desired family size falls even though as Dyson supposes this discrimination may be less likely to translate into mortality.

4 Importantly, Dyson does not regard the fertility decline itself to be a consequence of improvements in female social status. This view is in contrast to feminist perspectives which have traditionally called upon an improvement in the social status of women as being a necessary precondition of fertility decline. More recently, emphasis upon the role of abortion following foetal sex testing to India's fertility decline has strengthened the Dyson perspective and implies that fertility decline may to some extent in fact represent the continued prevalence of son preference in India.

5 Fertility decline is likely to contribute to these changing patterns of childbearing in two ways. First, it operates via increases in the age at marriage sufficient to increase the age at first birth so reducing the length of exposure to childbearing risk and the incidence of high risk births among very young women. Second, it is associated with increased contraceptive use among married women whose desired family size has been achieved, so reducing the incidence of high risk multiparous births and perhaps unwanted pregnancies among older women.

6 It may be the case that a decline in this demographic component of risk per birth could alone be sufficient to result in a significant decline in the maternal mortality ratio. If this is the case, a significant decline in the maternal mortality rate may also be expected as fertility is incorporated in this measure of maternal mortality.

7 This state has been chosen as although Gujarat's demographic characteristics fit more closely with India's northern demographic regime than with its southern regime, many of its characteristics are less 'northern' than other states such as Uttar Pradesh. Many, such as the sex ratio and some fertility indicators, as well as certain indexes relating to women's status, demonstrate a middle ranking compared with all other states and conform quite closely to all-India estimates [Dyson and Moore 1983]. Gujarat may therefore be viewed as a broadly representative state as far as much of its demography is concerned. The rest of my data collection took place in Ahmedabad, the largest urban area in Gujarat.

8 An example, of a recent field investigation is that of Bhatia's (1993) in which a high level of maternal mortality was found. The study estimated maternal mortality of 830 per 1,00,000 live births in rural Andhra Pradesh and 545 in urban areas.

9 The details of all estimation methods are given in Blum and Fargues (1990). It can be seen that

$$i(x) = Mf(x)/Mm(x) \text{ so, } Mf(x) = i(x) \cdot Mm(x) \text{ and}$$

$$i'(x) = Mf'(x)/Mm(x) \text{ so, } Mf'(x) = i'(x) \cdot Mm(x)$$

Therefore, if the age-specific maternal mortality rate per 1,000 is given by $R1(x)$,

$$R1(x) = Mf(x) - Mf'(x) \\ = Mf(x) - i'(x) \cdot Mm(x) \text{ and,}$$

if the age-specific maternal mortality ratio per 1,000 is given by $R2(x)$,

$$R2(x) = R1(x)/f(x), 1,000 \text{ where,}$$

$$f(x) = \text{fertility rate at age } x$$

10 Again, details of the extrapolation rules are contained in Blum and Fargues (1990). The first rule is a linear combination of two

adjustments, $Uf1(x)$ and $Uf2(x)$ is obtained by linear extrapolation of the logarithms of the mortality rates from age group mid-point 52 to mid-point 12 following the gradient of the mortality rate scheduled between the age group mid-points 52 and 72. Similarly, $Uf2(x)$ is obtained by linear interpolation between the logarithms of the mortality rates observed at age mid-points 12 and 52. The estimation of the mortality scheduled in the absence of maternal mortality is then derived as

$$Uf3(x) = \frac{(x-12)}{40} Uf1(x) + \frac{(52-x)}{40} Uf2(x)$$

where,

40 = distance between age mid-points 12 and 52 in X axis units (years). Therefore, if the age-specific maternal mortality rate per 1,000 is given by $S1(x)$, then,

$$S1(x) = Mf(x) - Uf3(x)$$

If the age-specific maternal mortality ratio per 1,000 is given by $S2(x)$, then,

$$S2(x) = S1(x)/F(x) \times 1,000$$

The second extrapolation rule involves the fitting of a quadratic function, $\log Uf4(x) = yx^2 + dx + v$ such that the following constraints are met

$$\log Uf4(52) = y52^2 + d52 + v = \log Mf(52)$$

$$\log Uf4'(52) = 2y52 + d = a$$

$$\log Uf4(12) = 144y + 12d + v = \log Mf(12)$$

where,

a = gradient of linear interpolation of the logarithms of the mortality rates between age group mid-points 52 and 72. Then,

$$y = \frac{\log Mf(52) - \log Mf(12) - 40a}{(52^2 - 144 - 40 \cdot 104)}$$

$$d = a - 104y$$

$$v = \log Mf(12) - 12d - 144y$$

If the age specific maternal mortality rate per 1,000 is given by $T1(x)$, then,

$$T1(x) = Mf(x) - Uf4(x)$$

and if the age-specific maternal mortality ratio per 1,000 is given by $T2(x)$, then,

$$T2(x) = T1(x)/F(x) \times 1,000.$$

Sources of bias error in the estimation of maternal mortality by these methods should be noted. Specifically, an abnormally high mortality for women from non-maternal causes at childbearing ages may lead to an overestimation of maternal mortality. For the case of India, deaths from external causes such as accidents and suicide may be a possible source of such a bias [See Blum and Fargues 1990, Mari Bhat et al 1994].

11 The whole procedure has been repeated for all-India SRS data (rural and urban areas combined). The results produce a broader picture than those from a single urban region. Table 1 indicates that trends of similar statistical significance were obtained from all methods for the all-India data. Method I produced a significant trend in the maternal mortality rate without the use of the modification. The method was therefore not repeated for this data using the modification. Importantly, for all methods a statistically significant decline in the mortality rate can be observed to coincide with an insignificant trend in the mortality ratio. For the all-India data it is interesting to note that this insignificant trend is upward. The all-India results do however, second the Gujarati analysis and make more forceful the inferences drawn.

Women and Land Rights in Cambodia

Kyoko Kusakabe
Wang Yunxian
Govind Kelkar

After the abandonment of the 'krom samaki' system of collective farming in 1959 both women and men of the People's Republic of Kampuchea secured equal titles to land under the liberalisation process adopted by the government. However, with contradictory and unclear legislation and with no checks and balances, the number of land disputes increased dramatically. This article attempts to understand the effect of this phenomenon on women's social position and on gender relations in Cambodia.

CAMBODIA, beset with agrarian problems in a unique demographic situation. Women constitute more than 60 per cent of the population and 30 per cent of the households are headed by women. Historically, women have had full rights to land and divorce or legal absence of men from the household did not affect such rights. In the 1989 land distribution, both women and men secured equal titles to land. In recent years, however, the largest number of claims received by the United Nations Transitional Authority in Cambodia (UNTAC) Human Rights Section concerned land disputes. This paper is an effort to understand women's entitlement to land, the legal and customary user rights concerning inheritance, registration and disposal of land and the consequent effect on women's social position and on gender relations in Cambodia. Since more than 80 per cent of the population is in the rural areas, this report is mainly concerned with the rural land situation and would not focus on urban land.

I

Question of Land and Resources

Historically in Cambodia, land theoretically belonged to the sovereign state. In practice, the land belonged to the tiller. It has been said of Cambodia that compared with other Asian countries there was no 'land problem' [Thion 1993: 41]. The population pressure was not severe and land remained easily available. Competition for land was not very intense. People were free to cultivate as much land as they liked. The communal system itself was loose and did not have a strong internal cohesion as in Vietnam. There was no communal land and no land registration. Local acceptance of land was the proof of possession in Cambodia. It was quite flexible, a cultivator could shift to another place to start cultivating new land, and gain the ownership for the new land [Thion 1993]. Peasants paid tax on harvest, rather than on land.

The concept of individual land ownership was introduced in Cambodia during the period of French colonisation. In 1953, Cambodia gained its independence, but the

concept of individual land ownership continued. Since however population density was not high, custom still played an important role and occupation meant ownership. On the other hand, in areas of rich rice land and the land on the outskirts of towns, from 1953 there was a trend of land accumulation by wealthy urban dwellers [Thion 1993: 42]. It was not landlords in countryside but urban businessmen and officials who accumulated land and lent money at high interest. Attempts were made to maintain low market values for land and prevent land accumulation, such as limiting the Chinese ethnic group's right to procure land. Despite such efforts, land accumulation created a new category of people, the landless rural poor. In 1962, 16 per cent of agricultural families did not own land [Thion 1993: 42].

In the late 1960s, the situation of the rural population worsened, with more and more farmers becoming indebted and eventually landless. The government's collection of the rice harvest at a very low price in January 1967 further impoverished the rural poor. Many peasants who possessed a small patch of land lacked other means of production. Most of them had to borrow money from moneylenders. Peasants then fell into the debt trap and they worked endlessly in the interest of the moneylenders. Under such circumstances, co-operatives and agricultural credits were organised with the encouragement of prince Sihanouk. However, they often proved to be ineffective because of manipulation by officials and local elites.

Officials and army officers issued to themselves title deeds of land which had been cleared by the tedious effort of local dwellers. They, at their will, denied the customary right of possession by occupation. Under such exploitation, the peasants fled into remote forest and joined rebellious groups during the 1960s and 1970s. This kind of impoverished condition was one of the reasons for the peasant uprising in southern Battambang in 1967, of which the Khmer Rouge took advantage. The peasant movement aimed to set up an equitable land holding system, cancel unjust debts and help peasants solve the agrarian problem.

Ironically, it was the war itself which led to a moratorium on the payment of large rural debts [Thion 1993: 44].

On March 18, 1970, Cambodia's royal government was ousted by a military *coup d'état*, but the system of private land ownership was untouched. The royal family's estates were confiscated, but this only led to corruption among representatives of the new ruling circles under the regime of Lon Nol, which was considered to be plagued with corruption permeating all layers of state authority and administration and beset by private greed.

During the period March 1969 to August 1973, American bombing affected large parts of Cambodia. Areas of southern Cambodia were devastated in this military operation, and many Cambodian civilians were compelled to flee their home areas. The ensuing civil war from 1970 to 1975 further internally displaced millions of Cambodians. It became more and more difficult to survive in rural areas and the number of urban poor grew rapidly. When the Khmer Rouge took over the country in 1975, Cambodians were first uprooted from urban to rural areas, and then from one rural area to another. Everything became common property except for the clothes that people wore.

In 1979, the Vietnamese invaded Cambodia and new authorities were installed by them. They continued the line of collective property rights and divided the people into collective work groups called *krom samaki* (or solidarity groups). The level of collectivisation of these groups varied. The first level was fully collectivised. Labour was collectively performed and produce was divided equally among the members. In the second level, there was collective ownership of major means of production. Land, however, was divided into plots allocated on a family basis corresponding to the number of family members. At the third level, all means of production were privately owned. This was very similar to production with the household as a unit, only that the land officially belonged to the state.

With the state, the People's Republic of Kampuchea, supported by Vietnamese armed military intervention, it is hard to think of

a just settlement of the land Vietnamese nationals in Cambodia had special privileges and a superior status [Grieve 1993]. Anyone resisting them or even suspected of having different sentiments was discriminated against. The establishment of strategic villages by the Vietnamese and the People's Republic of Kampuchea forced the people to abandon a number of former villages and hamlets and led to 2 00 000 internally displaced persons (IDP) in the course of the war. Many were drawn to the army, escaped to the border areas or became internally displaced persons. Internally displaced persons lost their homes and lands and had to live with relatives and friends after the wars.

PRIVATISATION PROCESS AND EMERGING ISSUES

In 1989, the People's Republic of Kampuchea changing its name to State of Cambodia, adopted a liberalisation process and the krom samaki system was officially abandoned. It was stated in the amended constitution: 'Cambodian citizens have full right to own and use land and have the right to inherit land granted by the state for the purpose of living on it and exploiting it' (Article 15) and 'The State prohibits the appropriation of fallow land through paying taxes for the purpose of selling or renting it out to other people. No one can use agricultural land and forested areas at will for other purposes without permission from relevant authorities' [Article 16 of Grieve 1993: 37]. As the krom samakis were forsaken, the families were supposedly to be provided with the same land they had been farming under the krom samakis on the basis of land possession. The process and extent of land distributed differed from place to place.

However, with contradictory and unclear legislation and with no checks and balances, the number of land disputes increased dramatically. In the absence of an independent judiciary to whom people could turn to seek protection of their rights, there was little that people could do [Grieve 1993]. During the transitional period that is after the signing of the peace agreement to the first general election, officials of the state of Cambodia took advantage of the confusion and sold almost all properties, including land, villas and factories. Foreign investors took part in land speculation and earning quick money. On the other hand, there is no effective legislation regulating agricultural land and common property lands and no regulations governing who can legitimately buy or sell land.

Three Cambodian political factions, the Khmer Rouge, the Khmer People's National Liberation Front (KPNI) and the National United Front for an Independent Neutral

Peaceful and Co-operative Cambodia (FUNCINPEC - its French acronym) emphasised that land distribution according to the state of Cambodia's legislation is unjust and favoured those who joined or co-operated with the Vietnamese occupational troops. By late 1992, people at large viewed the land issue as the worst example of extreme private greed and political bias on the part of the central authority [Grieve 1993].

II Field Work in Kdey Chass

In order to understand the threats and opportunities that women and men face in terms of land rights in this fast-changing scene in Cambodia, it is important to have, in depth study on the issue, especially focusing on common practices prevailing in the area and people's perception of land. Thus, one village was selected for a field work. This village, Kdey Chass village, Backheng Commune, Muk Kampoul district, Kandal province, is one hour by car east of Phnom Penh, across the Tongle Sap river. Kdey Chass village is located along the bank of the Mekong river. The average land holding is 40 *baire* (100 *baire* = 1 ha) per family [Bancz 1992]. It is basically a rice-growing area. People also get some income from growing vegetables and fishing in the Mekong river. The soil is rich and suitable for farming but water supply and drainage are problems. People mainly plant rice in the dry season since during the rainy season the whole area is flooded and unfit for cultivation.

The reason for selecting this village was because one NGO (CIDSE) has been working in this village for more than two years. Going through the NGO, it was relatively easy to win the trust of the people, which is essential for the survey. At the same time, a bridge is expected to be completed that will make transportation between this commune and Phnom Penh much easier. This implies that there is a high possibility that this commune will also be affected by the soaring land prices and land speculation that is already occurring in and around Phnom Penh.

The survey was conducted in December 1993, with the collaboration of the NGO working in the village. Since this was a rice transplanting season for this village, formal group discussion was difficult to organise. Therefore, mainly individual or informal small group interviews and discussions were held. Information was collected through the following methods: (1) Interview with district chief and the officers of the district land registration office in Muk Kampoul district on government's land policy and land registration system; (2) Interview with village headman on basic profile of the village and land redistribution process in the village; (3) With the assistance of one organiser of the

NGO, 13 village women were interviewed, some individually and some in group form.

The interviews were semi-structured and the discussion centred on such points as land registration, inheritance of land, land ownership in case of marriage, land and property disposal in conflicts between husband and wife, reasons for selling land, decision making for selling land and how they handled the paperwork, their perceptions of selling land, their perspectives on factors that enable some people to become rich, and general information on their living condition and work done by men and women.

LAND REDISTRIBUTION IN KDEY CHASS

In Kdey Chass, during the Sihanouk regime, land was privately owned and there was no common land. It was reported to us that forest area in the proximity of the village was also privatised. However, when land was sold, it had to have the approval of all members of the family, including parents and children. During the period 1975-79, land was totally communal.

When the Pol Pot regime ended, people occupied residential land as they wished. They selected the place they liked and occupied as much as they could. People who came earlier occupied better land. The owners of the land before 1975 did not have any rights over their lands. This was legally stated in April 1989 in the law granting of ownership rights over houses to the people of the state of Cambodia [Grieve 1993].

During 1979-89, land was communal in the village. There were 24 krom samakis in this village. One krom samaki consisted of 10-15 households. There existed all three levels of communality in this village. About 3-4 kroms among the 24 were doing total communal production (first level). In this system, people cultivated land communally and got the production according to the number of days that they worked. A pair of draft animals got a share of output equal to that of one person. Children and old people got 30 per cent of an adult share, regardless of their contribution to farming. Students helped in the fields during holidays, and got their share according to the number of days they worked. Women and men got equal share.

One of the main reasons for introducing the krom samaki system was because there was not enough male labour to carry on agriculture. Many men died during war as soldiers, especially during the Pol Pot time because men were more vulnerable to starvation than women. Considering the high ratio of female-headed households, collectivisation was thought to be the way to keep agricultural production going, and it was supposed to help widows who lacked agricultural labour. But widows interviewed in the village said that they are happier to cultivate their own land without the krom

samaki Under a *krom samaki* system, some people worked hard and some people did not work, but both of them got the same share. They found this unfair and frustrating. Moreover, without the *krom samaki* they are now free to sell vegetables and other crops in the market by themselves. Since this village is near Phnom Penh, they can earn some subsistence money from this small business. Ledgerwood (1992) reported similar views, and she interpreted it to mean that since full collectivisation lasted only two or three years in many places, people were slow to remember any benefits from such a short period and quick to state their pleasure at having ownership of land and personal freedom.

The other 20 *kroms* did not practice communal farming, but divided the land to members (second and third levels). They were not supposed to have any land rights at that time, they however helped each other in transplanting and other agricultural work. At present there is little mutual help and hiring of labour is common. The difference in communal farming system of the *kroms* depended on the leadership of the *kroms*.

This communal system lasted for five years. In 1985 the government did a survey of the situation of communal system and decided to privatise the land. The land of each *krom samaki* was divided by the number of people in that group. Even a small child was counted as one person. People drew lots to decide which land to take. There was however enough room for manipulations by the *krom leader*.

The procedure of land redistribution in Kdey Chass was as follows: (1) March 1989 Declaration of private land holding was done by heads of *krom samakis*. (2) 1989- (first phase) *Somkankap plaplaus* der th. Application of land per unit signed by the land owner, head of *krom* and head of village. (3) 1991-1992 (second phase) District Land Registration Office staff go to the site measure the area, verify the size of land in the application and write out ownership (*somkual sit*) card. For residential land, the card is signed by the provincial committee; for farming land, it is signed by the district office, though the same type of card is issued for both.

There have been 30,721 applications of land, which cover 90 per cent of the expected land holdings in the Muk Kampoul district. Among that, 28 per cent have been given ownership. Some 90 per cent of the registered land is owned by both women and men (husband and wife) and 10 per cent is owned by only women (widows).

It takes one month to measure and issue land ownership certificates for 10 plots of land. Ownership (*kamasit*) is given for residential land, that is, even if the owner moves out of the place, he/she can still retain

ownership. However, ownership is not given for farming land. Only possession (*phokea*) is given. That is, if the land is not used for one year, the authorities can take away the land. There seems to be some confusion between the ownership of residential land and possession of farming land, because all the farmers we interviewed said that their farming lands were registered and they have ownership. Everyone we interviewed thought that they have ownership of farming land too.

The district land registration office charges a registration fee to cover the operation cost. Initially it was 300 riels (US\$1-2,500 riels as of December 1993) but now it has been increased to 700 riels per registration for one plot of land. The amount defers from case to case. A woman interviewed paid 7,000 riels for her land. Some people have already gone through the procedure of registering their land but have not come to the office to take their land registration cards. One of the reasons for not taking the cards is unwillingness to pay the registration fee.

The registration officials said that people are not interested in registering the land since they do not see the importance of it. One of the women interviewed who understood the importance of registering land told us that even though she had to pay the registration fee, she wanted to make sure that the land belonged to her. Once she registered the land, she thought the land would be owned by her and it would be easier to sell it without trouble. Obviously, she is not clear that there is no ownership of farming land. But she believed there was no problem and in fact she had already sold part of her land. This was confirmed by the head of village, who also said that there is no problem in selling and buying land even without any ownership of land.

LANDLESS AND DISADVANTAGED GROUPS

There are some landless families in this village. Landless people include those who have migrated in after 1989 (after the declaration of land holding) and those who got married and separated from their parents after 1989 and did not get land from their parents. People who have smaller land holding than others include some female-headed households who did not get the share of land of their husbands and demobilised soldiers, who were not in the village in 1989.

There are again two types of landless people. One is of those who do not have land but have other skills and opportunities to earn enough money. These people chose not to be farmers. The other type is of people who do not have skill and capital to go for other occupation and wish to do farming, but do not have land. These people are the poorest people. Landlessness for the former

is not a problem, but for the latter it is serious.

Some landless families could only cultivate a small patch of residential land for vegetables. When the research was conducted, the price of lettuce was only 300 riels per kilo. They had to borrow seeds from the merchants at 100 per cent interest. One of our respondents told us that her mother does not like her, so she did not give her any land. Her residential land was given by the authorities in recognition of her husband's volunteer work in clearing the forest. The land is now registered under both their names. She has to work as a hired labourer in transplanting in which she earns 3,000 riels plus lunch per day. Since she does not have farming land, she works on other people's lands every day.

A number of young men between the age of 18 and 40 had been drafted by all the warring parties for unlimited military service many for more than a decade. Those who were young when they enrolled and left for the military from their parents' homes have since been demobilised. Since they were not in the village when land was distributed, they could not get their share of the land. It is difficult for them to live decent lives without any property and land. It is most likely that the families of these demobilised soldiers would have to take up petty trade in order to sustain themselves.

Female-headed households are often considered to be the most disadvantaged group. It was verified in our observation and discussion that female-headed households lack labour and often have land of smaller size. It is pointed out in some studies (Ledgerwood 1992). Where the woman is sole in charge, if she occurs all the while, family would be in extreme distress. However, being a widow itself does not necessarily mean that they are in economic difficulty. Some widows, especially those with grown up children, are better-off compared with others. Even then, when people say that she herself or another person is a widow, there is a certain connotation of being weak and helpless. Other people also see them as vulnerable and weak.

Economically speaking, some married women, especially those with disabled or gambling husbands, suffer more than widows. They would have to support their husbands and often lose control over their own earnings. Widows on the other hand, are able to have full control over their production and household as well. Even with that, people seem to pity widows more than these married women. The reason might be the weak image that widows have. People sometimes pitifully describe a woman as an orphaned widow, a woman who has lost one or both parents and is widowed, regardless of age. Widows and orphans are seen in the same light as people without support,

There seems to be not much discrimination against older widows, especially if they are rich. However, it is difficult for women who have recently been divorced/separated/deserted. They are blamed for not being able to keep their husbands 'on the right track'. This social perception leads to pressure on married women to endure their husbands' mistreatment and unfaithfulness, fearing divorce. From our observation, the social restrictions on married women are not very strict, but inside the household, the power relations seem to be quite against women.

LAND TRANSACTIONS

According to the district land registration office, since residential land is property, people can buy and sell their property with the permission of the district office, but for farming land, the conversion of farming land into residential land and sale of farming land both need permission from the provincial office. The status of transactions in farming land that is not registered as owned property is unclear. The village headman said that farming land, even if not yet registered, can still be sold with signatures from the local authority.

All land transactions are supposed to be notified to the authorities, but the village headman knew of only two such cases. However, he does not think this is a problem, because he estimates that most such transactions have been done between relatives. However, from our limited interviews, it seems that the people buying land are from Phnom Penh and bear no relationships to the owners.

There is one widow who has sold 900 square metres of land a year ago. People from Phnom Penh came to buy it. When the land was sold, those involved in the land transaction had to pay commission to the local authority. Whether the buyer or the seller pays the commission has to be negotiated. In her case, the buyer paid. The paperwork for selling land was done by her aunt's husband, since she herself could not read and write well. Even the signature was his. The land registration office said that in order to sell land, all the people under whose name the land is registered have to sign, but personal signature does not seem to have much importance. There was a case where a man gave up his land to make up for gambling losses without the wife's knowledge, while the land was registered under both their names.

Some people have sold land in order to build a new house or to buy machines and boats. Some sold land because of poverty and illness of family members. A woman who sold land said that they could not afford to keep the land, because the rice yield was bad for three years, and then

income from fishing was not enough. One of our widow interviewees has invested money from selling land on weaving. Now she has two weaving looms. Her younger sister who lives with her was the one who came up with the idea. She learned how to weave from another person in the village. The sisters weave silk skirts and send them to Phnom Penh for sale. They can weave one skirt in two days, one kaban (3.5m) in four days. One kaban can be sold for US\$ 23. The village headman said that as far as he knows, there is nobody who has moved out of the village because she/he sold land.

Generally, people seem to be indifferent about others' selling land. One group of women told us that they have never thought of selling land. 'If I sell land, where shall I live?' But one respondent said that she envies those who can sell land because that means they have enough land to sell some of it. Some said that those who sell land are people who have land along the road. Nobody wants to buy land which is far from the road.

LAND DEVELOPMENT AND MAINTENANCE OF COMMON PROPERTY RESOURCES

Since 1985, clearing land has been prohibited in this district. But during the communal system (1979-89), people were allowed to develop forest land ('dei prei') and keep it as their own. Later in 1989, they were also given land ownership for it. This land was not included in the calculation of their share of communal land. The land distributed to the krom members was only land that had been cultivated for a long time, and did not include newly developed land. One woman sold her family land from the krom samaki, but still has enough land for her six children, which she and her husband developed from waste land in the past few years. It is likely that households with man power and animals had more possibilities to clear larger areas of land, and female-headed households lagged behind in this regard.

According to the district land registration office, common lands include government reserve for fishing ('dei neisat'), government reserve for forestry ('dei rokar') and pond. However, the notion of common land does not seem to be familiar to the people here. People think that there is no common land in the village. Nevertheless, a rough observation in the field shows that there is vast area of land under flooding and bushes. It is most likely that people might not be considering this common land as their community property, since it does not seem to give any benefit.

People might not be aware of their rights to use the common land or not interested in it. In a new paper, it was reported that

the right to exploit a large fish pond in the village was sold to a businessman by the head of village, thus, villagers lost their access to fish in the pond. However, when we were inquiring about common land, we did not hear anyone talking or complaining about the fish pond. However, we have also learned that conflicts on the use of common resources among rural people are increasing especially for fishing and cutting woods for sale. The report from Outreach, a Cambodian non-governmental human rights organisation, has shown us that there were cases of violent conflict. There was a case in which four men of four poor families were killed on the spot while they were fishing. Why they were killed and who killed them is still obscure. The villagers who knew the truth dared not speak because they were afraid of revenge by those with power.

There is forest land and waste land that people call 'dei prei'. The village head said that they cannot develop this land because some is always flooded while the rest does not have enough water. The ownership of this land is not clear. There is a reservoir that was constructed a long time ago, but it is not functioning anymore. It is very shallow and cannot hold enough water to irrigate much land. The village head said that if the reservoir is renovated, they can plant crops in the waste land. Earlier, there was an attempt to improve the dike so that there will be water for the waste land. However, it was difficult to get labour from the villagers. Instead, people contributed money which was enough to hire a tractor. But the tractor broke down and eventually the dike could not be repaired.

It is specified in Political Instructions Concerning the Administration and Use of Land of June 3, 1989 that at a village level, two hectares, or at least one hectare, should be kept vacant to provide for growing/new families, poor people and for contingency arrangement. But it seems that is not the case in this village in Kandal province.

LAND DISPUTES

Some land disputes occur when people apply for land registration. Some people try to record more than they have and when the officers come to check, they borrow others' land for some time. This leads to confusion and disputes. There are cases of land conflict between the second spouse and children of the first spouse, for example, when the land is registered under only husband's name, and the first wife is dead. When he married his second wife, there was a land conflict between the second wife and children of the first wife.

One woman that we interviewed has a land boundary conflict with her neighbours.

Neighbours on both sides are planting on her land. The family on one side has planted banana trees one metre inside her land. She says that even if she complained, they did not listen, because she is poorer. She could not win the village committee's support since she could not afford to invite them for meals and drinks. She wanted to plant a fence around the border but the neighbours were against it saying that it would lead to shade on their lands. She does not have enough money to construct a fence around her land. She is now thinking of taking the case to the district office.

Land conflicts theoretically should be taken to court. The district land registration office does not have any legal power to settle disputes. Normally however they are resolved at village chief's level. The land registration office said that land disputes in this area are not yet had compared with Kampong Speu province however they had received a number of cases.

DYNAMICS OF IMPORTANCE OF LAND

According to several of our interviewees rich people are those who have more men, more cattle, more machines, more pumps and more land. If they have more labour power, they can clear/cultivate more land so they become rich. Having more labour power and draft animals is more important than having more land, since if they hire a pair of cattle and person to plough for one day, they have to pay back by transplanting for them for three days. This will delay ploughing and transplanting on their own land. Cattle are useful for other income generating activities too. For example, for cutting wood, cattle are needed for transport.

It seems that land is not considered as important as draft animals here. Because of the small plots of land and because most of the villagers can cultivate rice only once a year, the harvest often fails to feed the whole family. Only a few cultivate the land twice. One respondent said that it is easier to take vegetables to sell in the market in Phnom Penh rather than doing farming by themselves, so she thinks it better to give up the land and go in for small business. She owns farming land, but is not farming. Since there are only women in the household, she says that it is difficult to farm. She rented out the land to a person whose land is near hers. Her land is more than 7,840 sq m and she receives 4,000 - 10,000 riels per year, which she thinks is not much.

Mortgaging land is not yet much practised here. In case of loans, moneylenders do not demand a mortgage if the amount is 20,000 - 30,000 riels, which is often the amount borrowers need. However, the district land registration officer said that there are many

conflicts arising from land mortgage. The village headman said that earlier people with more animals were richer than those with more land, but now it is changing. People who have more land especially along the road are much richer than those with more animals, since they would be able to sell the land at a high price.

III Intertwining of Land and Gender Issues

In the household, woman is the manager and money keeper. Wife and husband discuss about expenditures. But if they disagree, the husband usually has the final say. It is not a female-headed household, normally, the husband takes the decision on selling/buying land. In this village, some men help in household work such as cooking, carrying water and child caring. Women also do jobs that are usually considered men's jobs such as cutting wood for sale. When asked when is the slack season, women seemed not to have any slack season in terms of working intensity.

Basically, the child that looks after old parent inherits the land. Some said that parents prefer to give more land to daughters because they are the ones who will take care of them when they get old. One respondent said that generally who inherits the parents' land depends on the parents' feelings towards their children.

The land regulation states that each village should have 1-2 hectares of land reserve for demographic change and newly formed families. This however was rarely practised. The village headman said that there is no land reserve left for new families. Though land was distributed in terms of the number of family members, only husband and wife signed the land title deeds. When children grow up and set up their own families, parents have the right to decide to give or not to give a portion of land. Since parents' land is already small in size, it is difficult to divide it among many children. Thus, many newly formed families are often landless.

In case of spouse's death, the land will belong to the widow(er). Even if she/he gets remarried, the new wife/husband is not entitled to land. However, this cannot resolve the conflict between the new wife/husband and the first wife/husband's children.

Cambodian women have always been enjoying legal land rights. In ancient times, women were entitled to land even when they got divorced. At present, if the land is registered in both husband's and wife's names, legally the land should be divided equally between the couple.

In the village, some respondents said that in case of divorce, land should be

divided between the couple, some said that it should be with the mother since she is the one to take care of the children. In practice, if the couple has been living by themselves, in case of divorce, usually the husband will go out of the house, leaving the land to the wife and children. Other properties can be divided between the couple. However, if the couple has been living with the parents of the husband, then the wife will have to leave the house with the children, but without land and without any compensation from the husband. Divorced husbands rarely send money to support children. One woman who has recently divorced her husband has come back to her parents' house with four children and without any property. The parents' house already has her sister and her family living together, and it was obviously overcrowded. The condition of divorcees, especially divorced women needs to be looked into.

IV Conclusion

In the surveyed village, there are many landless and some who have small plots of land. There are possibilities for increasing the total land available by developing the waste lands. However, the ownership and restrictions on the use of these lands were not clarified in this study.

There are some land transactions going on and the effect of selling land does not seem to be negative but on the contrary seems to be positive so far. Money from selling land has been used for investment in other income generating activities. It is not very difficult to do this, since the area is near Phnom Penh and there are relatively more income generating opportunities. However, there is still a need to verify this point, especially for the poor who do not have the skill to start a small business. There is need for more skill training and provision of capital in order to increase the opportunities for non farm income generation.

One point on which there is confusion is the difference between ownership and possession. Even though farming land is given only on possession, people take it as meaning ownership. It is still not yet clear what will be the implication of this confusion. Is there any possibility of farmers losing land because they are not clear of their rights to their farming land? Is there a difference in understanding between farmers and authorities on registration?

A small patch of land is indeed the base of most poor farmers. In the capitalisation process of natural resource, land is taken as the precious property for survival and emergency. However, not much can be

done with the land if the small land holders depending on farming do not have credit, infrastructure and marketing facilities access to farm inputs and services and local organisational supports. Cambodian women's experience has strengthened this argument. People see other income generation sources as more lucrative since the productivity of the land is not high especially with the lack of the above support.

From the information given by the district land registration office, it seems that the conversion from farming land to residential land is possible with provincial approval. And in fact if the farming land is not far from the village, people are likely to occupy farming land for house construction. In this case, it is possible that farming land near the village will gradually be turned into quasi residential land and then sold.

Common land is also a concept that has to be clarified further. People say that there is no common land, but who owns the flooded or grassy waste lands? Forest is state land, but how much access and control do the people have? How about water bodies?

As far as women's land rights are concerned, we can see two major problems. One is the procedure and regulation of selling land. Theoretically when land is sold, all people under whose name the land is registered have to sign the ownership card in order to transfer the land title. However, it seems that implementation of this regulation is loose and that it is acceptable to sell/buy land with only one of the owners' signature. This will definitely place women in a more disadvantageous position since men have more decision making power in the household and it is easy for them to sell the land without the consent of their wives. If a woman is not given a share from the sale proceeds of the land, it is likely that she will not have any secure source of living. A stricter regulation of signatures has to be implemented.

Another problem for women is that of land rights in a conflict situation. When a couple is divorced, the district office and some women say that all properties including land should be divided equally between the couple. However, since it is usually woman who takes children along with her, it is not fair for her to have only

half the share of the property. If she is living with her parents-in-law, most probably she will leave the house with children without any means of making a living. A woman whose husband left the house seems to be better-off compared with other cases of divorce. She is more independent and confident. But awareness raising, self-assertion, confidence building, creating bond among women and support system are necessary for women in conflict situations to have a stronger say in the sharing of property.

PUBLIC INTEREST RESEARCH GROUP

Presents

TNCs and INDIA

By Jed Greer and Kavaljit Singh

In collaboration with U. S. based **Multinationals and Development Clearinghouse** (an affiliate of *Multinational Monitor*), **Public Interest Research Group** has brought out this publication. "TNCs and India" is aimed at strengthening the information and knowledge base of activists and people at large, involved in research and campaigning on TNCs in India. This activists' guide is essentially addressed to Indian activists, researchers, people's movements and political groups. Written in a simple, non-technical and non-jargonised language, this guide will serve as a valuable tool for those interested to know TNC's.

Price : Rs. 50 or \$ 5

(Add Rs. 10/\$ 5 for packaging and postage & send M.O./Bank Draft in favour of *Public Interest Research Group, Delhi*.)

Address: Public Interest Research Group, 142, Maitri Apartments, Plot No. 28, Indraprastha Extension, DELHI - 110 092

Technology Priorities for India's Development

Need for Restructuring

S Chandrashekar

Technology upgradation is a vital component of economic reform and is necessary to enhance international competitiveness, yet the pattern of technology funding does not reflect priorities inferred from economic development and growth objectives. An analysis of R and D expenditure in India shows that funding for technology in specific sectors is not in consonance with the size of domestic or global markets. The sectors which should be given priority - agriculture, industry, health and forestry - receive relatively less R and D funding. Thus India needs to restructure its technology priorities as well as make its R and D activities more market-oriented

FOR countries like India, which are making the transition from centrally planned economies to decentralised market driven economies, technological upgradation is a vital component of the change strategy. Stretching out the liberalisation process over time will give Indian firms and industries breathing space to do so. However, depending solely on market forces to improve technological competitiveness may not be adequate.

Governments all over the world play a major role both in the development of new technology and in the consolidation of technological gains in established industries. The primary purpose of such activities is to foster economic development and improve the competitiveness of a country's key industries. The ways and means by which these goals are pursued vary widely from country to country. They range from active intervention and support (South Korea and Japan), to creating a benign business environment for new industries to emerge (the US).¹

Even in the US, the government is becoming increasingly activist. This is seen in the recent spate of large collaborative projects between the government and industry in emerging areas of technology such as the development of new integrated circuits, the information technology super-highway project, energy storage systems and biotechnology. The US government annual contribution in biotechnology alone is in excess of four billion dollars. As government spending in strategic areas like defence, atomic energy and space declines, the US is reorienting its national R and D and technology infrastructure towards industrial needs.²

In Japan and Germany close government industry partnerships exist to identify and support areas of importance. In these countries even though about 70-80 per cent of the money for technology development comes from industry, close co-ordination

and some critical funding has always been forthcoming from the government. South Korean firms have been built up with the assiduous and active support of the government both in terms of funding as well as in creating domestic conditions for competing in the international marketplace.³

In India a great deal of importance has been given to science and technology. The country has made a name in competitive basic research in a range of disciplines and had some notable achievements such as the green revolution in agriculture, the atomic energy and space programmes, and more recently in the missile field. However, the role of indigenous technology in the country's development has not been visible. As India strives to become a global economic power, it must reorient its R and D. Since the government is responsible for most of the technology development in India, one must look at government funding patterns to understand and analyse these priorities.

CURRENT INDIAN TECHNOLOGY PRIORITIES

The Indian government's current distribution of its science and technology budget is shown in Figure 1.⁴ Apart from government, Indian industry spends approximately Rs 1,000 crore on R and D making total Indian annual investment in R and D Rs 6,000 crore (\$ 2 billion). The US in comparison spends \$ 157 billion, Japan \$ 91 billion and South Korea \$ 5.4 billion. Germany, France and the UK spend from 10 to 20 times what India spends (see Table 2). Many companies in the world (IBM, SONY) have annual R and D expenditures that exceed the total R and D expenditure of India as a whole (see Table 3).⁵

India cannot afford to invest the huge sums of money that industries and governments of developed countries

routinely allocate to technology development and R and D. This makes it all the more necessary that India gets the maximum return from every rupee invested in technology and R and D.

As is evident from Figure 1, the strategic areas of defence, atomic energy and space account for more than 55 per cent of the S and T expenditure for 1994-95. When one looks at the trends, both defence and space expenditures have been increasing while there has been a decrease in the allocation for atomic energy from a peak of Rs 1,279 crore in 1991-92. Even so, investments in strategic technology still represents the cornerstone of the national S and T policy, with defence, atomic energy and space ranking first, second and third respectively. Agricultural research, with 9.6 per cent of the funding and an allocation of Rs 477 crore, ranks fourth in national expenditure. Industrial research ranks even lower - only sixth. The expenditure of Rs 360 crore for 1994-95 (7.3 per cent of the government S and T spending) is distributed to 40 laboratories catering to major industries like chemicals, drugs, leather, steel, etc. Electronics gets another 3.1 per cent. The area of medical research and health, with a projected expenditure of Rs 300 crore and 6.1 per cent of the total S and T expenditure, ranks seventh in priority. Biotechnology gets 1.8 per cent and environment, 1.4 per cent.

The relative spending on these sectors has not changed much over time (see Table 3). If India is to get the most from the money it spends on technology, its priorities should reflect current economic and social needs. Is this really the case today?

With the liberalisation and globalisation of the Indian economy, technology should be used to improve productivity in sectors, areas and industries that contribute maximally to economic development and growth. Technology development effort should therefore focus primarily on industries, areas and sectors that are large in terms of the

FIGURE 1 GOVERNMENT'S TECHNOLOGY ALLOCATIONS

domestic market. Productivity gains and value additions in such areas would then provide the base for making Indian products and services globally competitive and increase India's share of world trade. If this is so, the funding of different areas of technology should be in direct proportion to the size of the domestic or global market. Table 1 compares Indian technology funding with domestic markets, world production and world markets.

Before examining market and technology trends in each of the areas of Table 1, an overall assessment of the direction of Indian technology efforts from a development perspective is needed. To provide a framework for this, the data in Table 1 has been aggregated and recast into Figures 2 and 3. These figures relate the broad picture of technology priorities in various sectors to the major economic parameters, viz, domestic and global markets. It is obvious from Figures 1 and 2, that funding for research in areas like agriculture, industry etc. has not been commensurate with the domestic or international market sizes of these sectors. It appears that overall technology funding does not reflect priorities inferred from development and growth objectives.

The combined domestic output from the strategic sectors of defence, space and atomic energy estimated at \$ 2,500 million is much lower than the domestic output of agriculture (\$ 71,000 million) or industry (\$ 31,000 million). Individual crops like rice and wheat contribute much more to the economy than the strategic sectors. Many sectors and industries like chemicals, textiles, leather, electronics are bigger than defence. The thermal power industry is much bigger and much more important than the atomic power industry. Health, forestry and environment contribute much more to the economy but get much lower R and D funding.

There is therefore a need at the national level to emphasise priorities for agriculture, industry and to a lesser degree for health and forestry. India is one of the world's largest producers of most agricultural products and has the potential to become a major force in world agricultural trade. In spite of the green revolution, Indian agricultural technology is far below world standards, and as we will see later, the technology gap between India and the world's best producers appears to have widened. While progress in agriculture technology has kept pace with meeting domestic need, it has not generated a major surplus for export. In spite of the vast, untapped technological potential in agriculture and the availability of a strong infrastructure, the priority accorded to agriculture in terms of funding is very low. The impact of even marginal improvements in the productivity of agriculture would be substantial. The miracle of Chinese industrial development was preceded by an agricultural revolution with significant gains in agricultural productivity. Infusion of new technology and its translation into productivity gains has considerable economic potential in India. Since both domestic and world demands are likely to grow, the economic gains from productivity increases in agriculture can be substantial. Entry into world agricultural markets is easier than entry into the world space or defence markets.

In the industrial sector too, there are a number of well established areas like textiles, steel, chemicals, cement, thermal power and construction where the domestic industrial base is large and where substantial technology expertise and infrastructure exist. It would appear from Figures 2 and 3 that improving the competitiveness of these industries through technology upgradation may have a greater economic impact than increasing investments in

strategic technologies. In areas like electronic and telecom, the domestic market is likely to be big, and therefore the creation of technologically competent domestic industry is vital for India's progress. For emerging technologies like biotechnology, it would be logical to orient their applications towards areas that are important to India. Its greatest applications would be in agriculture and health and to a lesser extent, forestry. The relatively large domestic markets in these areas coupled with the biodiversity that is an inherent strength of India would make biotechnology a key competitive resource for Indian economic development.

There is of course a real link between strategic technologies and national security. This makes it necessary to support some strategic industries. But there is also a link between economic development and India's survival as a nation state. The balance is currently tilted so much in favour of military and strategic strength at the expense of economic development that it could imperil national integrity. The dramatic breakup of the Soviet Union, whose technology priorities were remarkably similar to that of India, reveals the dangers inherent in ignoring this link.

It is necessary to look at each of these areas separately to evaluate in greater detail their relevance in terms of world production, export opportunities, domestic markets and perhaps, above all else, domestic needs.

TECHNOLOGY AND MARKET TRENDS

Table 1, which links government's R and D expenditure with global and domestic markets, will be used as the basis for discussion in this section. The procedures used in compiling the data are outlined in the appendix. The transformation of the data in Table 2 into figures 2 and 3 are also discussed in the appendix.

Defence Technology

Defence has been accorded the highest level of expenditure in technology development. There has been a steady increase in the funding of the Defence Research and Development Organisation (DRDO) as is seen in Table 3 (see Annexure 1). About 21-22 per cent of the total R and D money spent by government goes into defence alone. The value of defence production (domestic market) was about Rs 6,000 crore (\$ 2 billion) in 1993-94. India also imported about Rs 3,000 crore (\$ 1 billion) of arms in 1992. India was the world's largest importer of arms and defence equipment in the 1989-92 period with imports totalling \$ 13.2 billion.⁷

FIGURE 2 TECHNOLOGY FUNDING VERSUS DOMESTIC MARKETS

The arms industry appears to be in decline with world production having fallen from \$ 832 billion in 1986 to \$ 661 billion in 1992. This is a trend that is likely to continue as the developed countries disarm. The world trade in arms and defence equipment has also declined from a peak of \$47 billion in 1987 to \$18.4 billion in 1992. As the world market for arms and defence equipment declines competition for the available business is likely to intensify. Major global players with the tacit support of their governments will strive to retain market shares. Mergers, acquisitions and consolidation will be features of the industry worldwide. Recent developments in the American and European defence industry bear this out.

Though India may enjoy some kind of a competitive advantage in conventional arms or in some hi-tech areas like missiles, the barriers to entry are high. Existing controls within the Indian government as well as lack of professional marketing and financing expertise make it extremely unlikely that the Indian economy will gain substantially through the export of defence products. Indian export of defence products have traditionally hovered around Rs 50-70 crore. Exports in 1993-94 were estimated at about Rs 68 crore, less than 2 per cent of production. The poor record of exports substantiates the internal as well as external constraints for Indian entry into this market. Apart from purely technological and commercial considerations, international control regimes like the missile technology control regimes (MTCR) and the nuclear proliferation treaty (NPT) are also likely to come in the way of export for the hi-tech segments of the arms market.¹

World production of arms and the world market for arms ranks fifth and sixth respectively. The Indian defence market also

ranks sixth in domestic importance though it ranks number one in funding. Exporting arms calls for a coordinated effort internally within India. It may also call for some changes in the Indian position on the nuclear and missile proliferation issues. The prospects for capitalising on the capabilities of the defence industry are therefore not very promising.

Atomic energy

The second area that receives a major portion of the Indian \$ and T allocations is atomic energy. This accounts for about 20 per cent of government expenditure on technology. The major focus of the effort here is the development of economically viable power from the atom. In India the area is also perceived as strategically significant with demands that India retain the nuclear option becoming more strident. The budget allocation for the department of

atomic energy for 1994-95 is Rs 958 crore.

Worldwide the nuclear power industry is clearly on the decline. The International Atomic Energy Agency estimates that about 72 reactors were under construction worldwide as of end of 1992, which would contribute about 25,000 MWs additional capacity by the year 2000. When one looks at the share of nuclear power in the overall generation of electricity, the percentage worldwide is likely to come down from 11.3 per cent in 1992 to 11 per cent in the year 2000. It is further expected to decline to 8-10 per cent of the total electric power in the post 2000 period.

The experience of individual countries substantiates this declining trend. No new reactors have been ordered in the US since 1970. Most countries in Europe have decided to forego new additions to nuclear power. Even in France, no augmentation is proposed after the construction of five ongoing nuclear plants is completed.² New nuclear power capacity is being created mainly by the developing countries of which India is a leader. Even China would have only three nuclear power plants contributing 0.1 per cent of the total electricity generated. The annual value of the world production of nuclear plants can be estimated as \$ 4 billion.

In India, projections made by the department of atomic energy envisage the addition of a little over 2,000 MW to the existing nuclear power capacity of 1,800 MW by the year 2000. This will involve the completion of five ongoing 220 MW plants and the construction of two 500 MW plants.³ Although on the basis of past performance, these projections appear optimistic, we will assume that these targets are achievable. When this capacity is distributed on an annual basis over a six year time frame, at the current estimated capital cost of nuclear plants of Rs 4 crore per megawatt, the annual value

TABLE 1 TECHNOLOGY PRIORITIES IN RELATION TO GLOBAL AND DOMESTIC MARKETS

Area	Technology Expenditure 1994-95 (\$ million)	Rank	Value of Indian Production (\$ million)	Rank	Value of World Production (\$ billion)	Rank	Value of World Trade (\$ billion)	Rank	Trends
Defence	352	1	2000	6	661	5	18.4	6	declining
Atomic energy	319	2	433	7	4	10		11	declining
Space	251	3	100	9	35	8	8	7	stagnant

2. For explanation and references on how this table was prepared see appendix.

FIGURE 3 TECHNOLOGY FUNDING VERSUS INTERNATIONAL MARKETS

from the nuclear power industry in India is approximately Rs 1 300 crore.

As far as trade or export in this area is concerned, the major market is of course the export of nuclear power plants, especially to third world countries. Proliferation concerns are likely to limit world trade in atomic energy related products and services.¹

Power from the atom constitutes only 3 per cent of the total electricity generated in India as against 11 per cent in the world. When one looks at the energy projections for India, it does not look as though this percentage will significantly alter. Over 70 per cent of electricity is generated by thermal power plants and electricity from coal is the major source of power. This is likely to continue.¹⁵ Moreover, in a world where nuclear power is on the decline and power from coal has been fairly steady in terms of market share, building an efficient, cost competitive power industry based on coal should be a higher priority than building capabilities in nuclear power. If the efficiency of our thermal plants can improve even by 1 per cent, about seven billion additional units can be generated every year with a monetary value of about Rs 1 400 crore. Similarly, an improvement in the plant load factor by 1 per cent can produce about three billion units of electricity with a value of around 700 crore. These improvements will also alter the demands on the infrastructure required to run power plants, such as rail transport, additional investments in new power capacity, etc. Improvements in motors and end-use equipment are also likely to contribute enormously to the economy.¹⁴

But when one looks at the priority that India accords to research on energy from coal, there arise questions about the process of allotting technology resources. The major government undertakings in the coal and

power sector spend about Rs 70 crore on technology related to thermal power.

India has over 5 per cent of the world's coal reserves even though it is of poor quality. Looking at the current and future contributions of coal to the power sector, technology capability in this area is vital for India. Domestic requirements are reasonably large even by world standards, and the development of cleaner, more efficient and environmentally friendly technology using Indian coal appears to be a more logical development route for India to take than say, depending on power from the atom.¹⁵

Space technology

The third area of major funding has been space technology. Expenditure on space in India has been growing steadily and at a faster rate than both defence and atomic

energy. As in the case of atomic energy, space is a strategic area. Indian expenditure on space has seen a major increase in the period 1991 to 1994 (see Table 3). Part of this increase can be ascribed to problems faced by India with regard to the missile technology control regime (MTCR) and American pressure on Russia over the supply of cryogenic technology.

World expenditure on civilian space activities in 1992 was estimated to have been about \$ 35 billion. The two main spenders, the US and Russia, have cut back on funding. In Europe, the space effort seems to be more or less static with new initiatives like the Hermes manned space plane being postponed or phased out. The world commercial market for traded space products and services was estimated at around \$ 8 billion in 1992. The dominant segments of the market are communication satellites, launchers and ground equipment for satellite communications. Most recent projections indicate a decline in the communications satellite market after the current peak of 23 launches per year for the 1994-96 period is over. This is expected to decline to about 16 satellites for the period 1997-2000 and further decline after 2000. This decline will also result in a reduction in the requirement for launch vehicle services. Amongst the various segments, the market for ground equipment is likely to experience reasonable growth. The ground segment market for 1994-95 is expected to be around \$ 3.8 billion.

An analysis of the overall trend is that there will be a decline in the civilian market from the current \$ 8 billion per year to about \$ 7 billion in the 1996-2000 time frame. A drastic increase in growth beyond the current \$ 8 billion level is unlikely. The market can

TABLE 2 STRUCTURE OF WORLD R AND D EXPENDITURE

Country	R and D 1991 Estimated (Billion \$)	R and D as Percentage of GDP	Civilian R and D as Percentage of GDP	Sources of Funds		Expenditure by Sector	
				Busi- ness Per Cent	Govern- ment and Others Per Cent	Busi- ness Per Cent	Government and Others Per Cent
USA	157	2.8	2.1	51.3	48.7	72.6	27.4
Japan	91	2.7	2.6	80.4	19.6	70.9	29.4

India	2.0	0.9	0.5	20.0	80.0	26.0	74.0
Pakistan	0.4	1.0		-	-	-	-

Notes: 1. The total world spending on R and D in 1990 was estimated at about \$ 450 billion. It may be about \$ 475 billion in 1993.

2. The 1991 estimated R and D is calculated from the percentage of GDP devoted to R and D as stated in *Research and Development Statistics 1990-91* published by the department of science and technology, government of India. The GDP numbers are taken from *World Development Report 1993* published by the World Bank.

3. Data for Korea is taken from *Building Industrial Competitiveness in Developing Countries*, OECD Development Centre Studies by Sanjaya Lall.

FIGURE 4 MATCHING TECHNOLOGY PRIORITIES AND DOMESTIC PRIORITIES

Note The figure depicts the relationship between the technology priority of a sector and its domestic market size. Ideally, the technology priority of a sector should reflect its market size. This means that the positions for all sectors should lie along the diagonal. This is obviously not the case for India, for which the base of the arrow indicates the current position and the tip of the arrow indicates the desired position. In the case of defence, space and atomic energy, since there are other considerations that determine the priority, the arrows are shown as a dotted line.

therefore be considered a mature, slow growth or static market.¹⁶

National space markets are strongly controlled by governments. These markets are therefore neither open nor competitive. A handful of large multinationals control trade in space products and services.

Satellites built in India are roughly half the cost of similar ones built abroad. In spite of lower costs, exports of satellites and satellite subsystems from India is not easy since the market for geostationary satellites is declining and a number of large American and European firms dominate the market.¹⁷ As far as the launcher market is concerned, it appears that there would be too many rockets competing for the launching of fewer satellites. The Indian launcher GSLV will also not be able to launch the larger three tonne class geostationary communication satellites that will constitute the bulk of the market in the 2000 time frame.¹⁸

The market for satellite terminals and ground stations is the one segment of the space market that will grow. Both Indian domestic demand and world demand, especially in the Asian area, is likely to increase. A number of Japanese, American and European companies are major players in this market with Japanese companies dominant. In spite of having technological capabilities to build such equipment, there are no Indian companies comparable to Japanese companies like NEC or American companies like Scientific Atlanta or Hughes.

These market trends make it unlikely that space will provide a major growth area for India.

Agricultural Research

Agricultural research receives the fourth largest share of S and T funds. With a planned expenditure of Rs 477 crore in 1994-95, it has an outlay well below that for space. Although there have been increases in the budget for agricultural research in the last two years, it gets only about a half of the money allotted to defence.

The value of the Indian market, based on personal consumption data provided in the GNP estimates was around Rs 2 14 000 crore (\$ 71 billion) in 1991-92, as compared to \$ 2 billion for defence. The value of world agricultural production can be estimated at about \$ 2 000 billion in 1992. World trade in agriculture and agriculture related products was \$ 444 billion in 1992. World trade grew at an average of 5 per cent for the 1980-92 period. By contrast, world trade in arms is declining and is currently about \$ 18 billion.¹⁹

In terms of physical quantities, India is among the world's largest producers of almost all agricultural products. India is one of the top two producers in the world of rice, wheat, millet, groundnut, sugarcane, tea, tobacco, fruits, spices and milk. In most other agricultural products, India has a fairly large share of world production. With some exceptions, the prices of most Indian agricultural products are lower or comparable to world prices.²⁰

Indian productivity gains have not been comparable to those of, say, China, which has made rapid strides. As a result, Indian technology for agriculture is far below world standards. Over the years, the technological gap between India and the US has practically remained the same, in spite of stagnation in US productivity. China, whose productivity in cereals in 1961 was 56 per cent of US productivity, had reached 88 per cent of US productivity levels in 1990. The technological gap between China and the US has narrowed while that between India and the US has remained the

TABLE 3 TECHNOLOGY EXPENDITURE OF MAJOR SCIENCE AND TECHNOLOGY ORGANISATIONS
(All figures in Rs crore)

Area/ Organisation	1988-89	1989-90	1990-91	1991-92	1992-93	1993-94	1994-95	Percentage of Expenditure 1994-95

Notes: 1. The industrial research allocations are for 40 CSIR labs covering many big industries.
2. The allocations for health, environment and wildlife exclude operational budgets.
3. The allocations for science and technology include the budget of Survey of India and Indian meteorological department (170 crore) and fundamental research (75 crore).
4. Compiled from annual reports and annual expenditure documents.

same while these are macro indicators, this trend is also substantiated at the individual crop level.²¹

As a consequence of liberalisation India has shown significant economic gains through export of agricultural commodities. In money terms exports of agricultural products increased from Rs 6 200 crore (\$ 2 billion) in 1991-92 to Rs 7 600 crore (\$ 2.5 billion) in 1992-93. The value of exports for 10 months of 1993-94 is Rs 8 700 crore (\$ 3 billion).

Indian policy on agriculture and export of agricultural products has always placed domestic requirements ahead of foreign trade. Clearly no government would like to see a food shortage develop in the country. Therefore export is carefully controlled and regulated. The recent tussle over cotton exports and increases in the domestic prices of cotton indicates the kinds of problems that could arise. To become an exporter without harming the concept of self-sufficiency, Indian productivity gains in agriculture are mandatory. The Indian Council of Agricultural Research (ICAR) has a large number of research institutions covering all important agricultural crops. The link between research and applications is strong as can be seen in the success of the green revolution.

No discussion on agriculture can be complete without reference to how the new and emerging area of biotechnology is likely to play a major role in increasing productivity and reducing costs of production. Although this will be dealt with later, a few lines would not be out of place here.

Developments in genetic engineering have made it possible to directly transfer genes carrying desirable traits into common plants, crops and animals. These transferred genes enhance the economic value of crops and animals. The bacterium *Bacillus thuringiensis* (BT), for example, produces an insecticidal protein effective against butterflies and moths, two major crop predators. The gene associated with the production of this natural insecticide has been identified and successfully transferred into a number of commercial crops like cotton, potato and corn. Cotton plants with BT genes have been field tested for more than two years. With such plants the use of artificial insecticides, which are both toxic and costly, can be significantly reduced. Similar results have been achieved with potato. Both potato and cotton are very important crops for India.

In addition to genes for insect protection, genes that confer natural resistance to the application of herbicides have been identified and inserted into a number of plants. Such plants are very tolerant to specific herbicides. These herbicides can therefore be used liberally to kill weeds without affecting the plant itself. Such genes have been introduced

into tomato, soyabean, cotton, etc., and more than three years of field testing have already taken place in many countries. Plants with both herbicide and insect protection have also been developed.²²

Scientists have also identified the genes that are responsible for the ripening of fruits. They have been able to manipulate these to delay the onset of the ripening process. The first delayed ripening tomatoes went on sale in California recently.

The tools and techniques that are required for such activities are now widely available. The problem is not with the technology but the application of the technology to problems of economic relevance. Indian capabilities in biotechnology both in terms of applications and funding do not appear to be adequate for India to remain technologically competitive in this field.

More than 50 important crop types have been genetically engineered by companies and organisations abroad. These include almost all the crops of commercial importance to India. Both product and process patents for most of these crops are with foreign companies. Calgene, a US company, for example, has the patent on a cotton plant that is resistant to the weed killer bromoxynil. Monsanto, a US based agribusiness and chemical company, has patents on cotton plants that are resistant to insect attack. There are reports that the Indian department of biotechnology will buy this technology at a price of about four million dollars. China has launched a rice genome project to unravel the genetic structure of rice. Undoubtedly, such knowledge subsequently would be used to genetically engineer rice to improve yields and reduce artificial inputs. China already has one of the highest rice yields in the world and is also involved in genetically engineering fish.²³

The comparative advantage that India enjoys in agriculture is substantial both in volume and variety. India also has a biodiversity regime providing a vast gene pool that can be a major asset if used wisely. A development route that builds on agriculture promises to be a more equitable, balanced and logical route. Without a reorientation of our national priorities and a closer linkage between publicly funded research in agriculture and agribusiness, one fears that even in an area where India has appreciable strengths, we would continue to be a follower rather than a leader. A focused approach that builds on India's strengths in agriculture will not only have a major domestic impact but will help in pushing Indian agricultural products into foreign markets.

Science and Technology

The fifth largest spender of government S and T funds is the area that is classified as science and technology. The money

allotted under this head for 1994-95 is about Rs 386 crore and has seen an increase of 15 per cent over the money allotted in 1993-94 (Table 3). The expenditure under this head includes provisions for the Survey of India, the National Atlas and Thematic Mapping Organisation (NATMO) and the India meteorological department (IMD). This budget head also supports a number of institutions engaged in fundamental research like the Raman Research Institute, the Indian Association for the Cultivation of Science, etc. The rest of the money (about Rs 145 crore) is what is available for technology development as well as for support of extramural research in a large number of universities and academic institutions in all disciplines of scientific research.

Industrial Research

Industrial research receives the sixth largest chunk of S and T funds from the government, with Rs 360 crore for 1994-95. This money is allotted to 40 CSIR laboratories covering the spectrum of research activities in a number of industries such as chemicals, electronics, aerospace, glass, metallurgy, etc.

Industry (excluding drugs and electronics which are covered in separate sections below) spends approximately Rs 700 crore a year on R and D, making a total of 1 000 crore. This Rs 1 000 crore is distributed over a large number of sectors and industries. Chemicals, leather, glass, automobiles, machine tools, consumer durables are all major industries which are very big. Many of them are much bigger in size than atomic energy and space. Some of them like the chemical industry are bigger than defence. But even when industrial contribution is taken into account, the money spent on industrial research is very small on a per industry basis.²⁴

The industrial sector, which ranks number one in terms of economic importance in the world and number two as far as the Indian economy is concerned, is placed a poor sixth in government support. In terms of government funding it receives only one third to one half of the S and T money allotted to space or atomic energy programmes. A new policy that promotes focused industrial research is crucial for India's reform programme to succeed. Leaving technology development efforts to market forces alone is not an effective strategy. The prioritisation of different industries within the industry sector would require further detailed work.

Health

About Rs 300 crore a year is spent by the central government on education and research in the health sector. From available GNP data, Indians spent about Rs 12,500 crore

in 1991-92 on health care. This obviously includes money spent for hospital medical care as well as medicines. In terms of domestic market, the health care sector ranks third, after agriculture and industry.

The worldwide expenditure on health care in 1992 was estimated at \$ 1,700 billion by the World Bank. The accessible market can be estimated to be around \$ 300 billion. This gives health care a rank of four in terms of export markets after industry, agriculture and electronics. Health is only seventh in Indian priorities, which is not consistent with its domestic or export importance.

The problems related to health in India are quite different from the problems faced by most advanced countries. The research programme in health as well as the development of new drugs, vaccines and equipment should reflect these priorities. Cost effective health care for the large majority of Indians should be the driving force behind the research effort. If such an approach is adopted, there will be export markets in other third world countries who share similar problems. These goals may not be achieved if decisions are entirely left to market forces.

We have already touched upon the role of biotechnology in agriculture. Needless to say, it has an extremely important role to play in the health care field. India has a large heritage of Indian systems of medicine based on herbs and plants. Not enough has been done to look into these and apply the tools on modern technology, especially biotechnology, to reap the full benefits of this expertise. If no action is taken, derivatives from many traditional Indian medicines may be patented and marketed by foreign companies.

Non Conventional Energy

Non conventional energy with an outlay of Rs 226 crore for 1994-95 ranks eighth in terms of funding. The domestic market for these technologies can be estimated at Rs 300 crore (\$ 100 million). The value of world production can be assessed at about \$ 5 billion and the annual trade at about \$ 500 million. It is ninth in terms of trade potential.

Wind energy systems are more or less commercial, and above certain wind speeds compare favourably with thermal power from fossil fuels. Biomass can be used as a source of heat or for generating power, and technologies for this are fairly well developed. India generates large quantities of agricultural waste and therefore these technologies are quite relevant.

In the case of solar thermal and solar photovoltaics, the technology status is such that they are not as yet commercially viable sources of power, except for select niche markets. The cost of power generation from these sources is still at least three

to five times the cost of generation from conventional sources. Solar water heaters based on Indian technology with a subsidy component have been successful on a small scale.

When one looks at the allocations to this sector in relation to allocations for technology development in the power or energy sectors, this sector receives considerable attention. Coal and cleaner coal technologies once again appear to get much lower priorities, though in economic terms they appear to be more relevant.

Electronics

With a planned spending of Rs 150 crore for 1994-95, electronics ranks ninth in government S and T priorities. Apart from government funding, industry may also spend about Rs 700 crore on technology development and R and D. The value of Indian production of electronics was estimated at about Rs 11,400 crore (\$ 3.8 billion) in 1992 and may be around Rs 15,000 crore (\$ 5 billion) currently. Of this production of Rs 11,400 crore, exports were about Rs 1,260 crore (\$ 420 million). Electronics as a whole is a growth sector worldwide with world production estimated at about \$ 750 billion in 1994. The trade in electronics, which is a relatively open market, can be estimated at about \$ 500 billion. It ranks second in world trade and fourth in domestic production.

The Indian electronic industry is primarily based on technology acquired from abroad. Software and computer exports are major foreign exchange earners. To compete in global markets, a minimum scale of production is necessary. Most Indian domestic markets are not large enough to achieve such economies of scale. The earlier practice of insulating the Indian electronics industry from global competition has further widened technology and market gaps. The Indian technology effort should therefore be strongly oriented towards the needs of the global market. Areas such as telecom and consumer electronics, that are likely to grow to meet domestic needs, would be good candidates for basing major technology initiatives that address global markets. This would require research collaborations between Indian and foreign companies and laboratories. Indian R and D expertise, which is relatively inexpensive by world standards, could make a significant contribution here. To acquire strengths in elements such as microelectronics, India may have to adopt innovative strategies such as getting major chip manufacturing multinational companies to set up production and R and D facilities in India.

Forests and Wildlife

The total amount spent on infrastructure research and technology projects on

forests and wildlife is about Rs 116 crore. In India a large number of people depend on the forests for their livelihood. The value of output was about Rs 9,000 crore in 1991-92. In terms of importance to the domestic economy, forests rank fifth after agriculture, industry, health and electronics. Firewood from forests is the most important source of energy for the poor. The decrease in forest cover in India has also been a cause of growing national concern. Forests are the most important source of biodiversity and the gene pools resident in them can become major national assets with the growing importance of biotechnology. When seen from this viewpoint, the quantum of resource that goes into managing this area appears to be inadequate.

Biotechnology

With an allocation of Rs 90 crore for 1994-95, biotechnology is almost at the very bottom of the priority list. Even though the world production of about \$ 10 billion places it only ninth globally, it is widely predicted to become one of the fastest growing sectors. A \$ 50 billion to \$ 100 billion market by the year 2000 has been forecast for biotech products.

Apart from government expenditure, some money is also being spent by industry, but this is relatively small. A part of agriculture research and health care, some money is allocated for biotechnology.

The main areas of application of biotechnology are in health (drugs, diagnostics, treatments), agriculture and animal husbandry (genetically engineered plants and animals), tissue culture, environment (genetically engineered bacteria for waste handling) and some other related applications like fermentation. We have dealt with biotech applications in agriculture and health earlier. One of the advantages of biotechnology as compared to traditional methods of improving crop and animal varieties is the speed with which improvements can be achieved. Drugs like insulin produced by the biotech route are replacing traditional methods of production from human and animal sources. The diagnostic tool available through use of monoclonal antibodies are likely to ease the diagnosis of even the rarest of diseases. On destroying bacteria patented by a US based Indian scientist has been found to be effective against oil spills.

A number of US based biotech companies like Genentech and Calgene have emerged as major players. Established chemical and drug companies are also moving into the biotech area to ensure that existing product lines merge into and mesh with biotech substitutes and alternatives.

The US government, the Japanese government and a large number of European governments are investing large sums in

biotechnology to ensure future technological competitiveness. As pointed out earlier, India can draw upon its vast natural diversity in the application of biotechnology. The technology base required is now widely available. The choice of appropriate problems and funding is the issue, not the technology. In spite of good infrastructure, India is far behind the developed world. China is forging ahead in many applied areas in both agriculture and health. To translate the enormous potential of biotech into commercial applications, new approaches from both government and industry are needed.

Environment

When operational elements are taken out, the allocation for technology and infrastructure in environment is only about Rs 68 crore. This includes the budgets of the botanical and zoological surveys. When the budgets of the Indian meteorological department and the Survey of India are added (approximately Rs 160 crore) the total amount spent increases to about Rs 230 crore.

Indian production of pollution control equipment is estimated at Rs 700 crore. World production is estimated at about \$ 200 billion with a traded value of about \$ 20 billion. This puts environment seventh in domestic importance and fifth in terms of world trade. These numbers reflect only the value of pollution control equipment and not the real value of environmental control measures.¹¹

INDIAN TECHNOLOGY DEVELOPMENT VIS A VIS THE WORLD

Apart from changing the priorities for technology development in India, there is a desperate need to increase the absolute levels of funding for important areas. While India has the advantage of lower wages for scientists, it has to pay international prices for equipment, chemicals and other raw materials.

The extent of the funding gap between India and the rest of the world is often not realised. Table 2 compares the scale and the structure of the Indian technology development effort with the efforts of some other countries.¹² India spends about \$2 billion on R and D. This is a very small amount in comparison to what the developed countries invest in R and D. When one compares R and D expenditure as a percentage of GDP, most western economies spend between 2.3 per cent and 2.8 per cent of the GDP on R and D.

Indian expenditure at 0.9 per cent is close to that of Pakistan (1 per cent) and not too far from Italy (1.25 per cent). South Korean expenditure on R and D is 1.9 per cent of its GDP, which is close to that spent by many developed

economies. This in part reflects the significant progress made by South Korea in recent times. When one takes out expenditure on strategic technologies (defence research, space research and atomic energy) the Indian expenditure at 0.5 per cent of its GDP is very low. Most developed countries have civilian R and D at between 2.1 per cent (the US) and 2.6 per cent to 2.7 per cent of GDP (Japan and Germany).

The other thing that is obvious from Table 2 is that in all the developed countries at least 50 per cent of the R and D funds are put in by industry. Most government spending on R and D is also carried out in industry. In Japan, Germany, UK and South Korea 70-80 per cent of the money for new technology development comes from industry. In the US, France and Italy, the contribution from industry is around 50 per cent. In India, by contrast, over 80 per cent of the funding for R and D comes from government and almost all of this 80 per cent is spent in government-run establishments. This pattern of funding reflects the importance given to the strategic sectors of defence, atomic energy and space, which are large vertically integrated government programmes. When funding for these sectors is taken out, the government and industry shares work out to be 67 per cent and 33 per cent respectively.

In the context of economic reform, there is a need to alter this structure and pattern of funding to reflect a market and industry orientation. This would mean greater involvement of industry both as a source as well as a user of development funds. Greater industrial involvement would also help change priorities towards areas with the highest economic returns.

POLICY IMPLICATIONS

A technology strategy that builds on India's innate strengths seems to be the most appropriate route to follow to meet development and growth objectives. Existing priorities for technology development do not appear to be in consonance with the objectives of the new economic policy. When economic development is used as a criterion for identifying priorities, agriculture, industry, health and forestry appear to have higher priorities.

A strong domestic base is a great asset for competing in global markets. From this perspective, the highest priority for India appears to be agricultural technology. The size of the domestic market, the strong R and D infrastructure, and the major impact that even incremental improvements will have on the economy, make an agriculture-oriented approach to

technology inherently attractive. India appears to be competitive in most agricultural products in spite of poorer technology.

Apart from traditional agricultural technology, the methods and techniques of biotechnology offer new commercial possibilities in agriculture. Selection of the right applications of biotechnology appears to be the issue today, not the availability of the technology itself. India's strong biodiversity regime provides a rich genetic base for developing new agricultural products. There is an urgent need to initiate technology development programmes that integrate these capabilities. When compared with other advanced countries, India seems to be lagging behind in many agricultural applications of biotechnology. This is a dangerous trend for a country whose economy is still strongly rooted in agriculture.

There is also a need to assign higher technology priorities to the industrial sector. Technology development programmes here should cover both well established and emerging industries that are likely to have a major domestic impact. Infrastructure industries like the thermal power industry and the telecom industry appear to be particularly important. In the health sector, the focus of R and D should be on diseases and ailments relevant to India. Biotechnology applications in identified areas are also very important. If India is to become a major player in the world market, there is a need to concentrate upon technologies that are commercially relevant.

Figure 4 depicts the broad directions along which changes in the funding pattern should take place. This diagram is based on the ranks assigned to the various areas in Table 1. This does assume that economic and market criteria should be the major determinants of priorities.

India also needs to alter the current structure of its R and D activities and make it more market and industry oriented. This requires new links to be forged between government and industry at several levels.

The other important issue is to increase in absolute terms the quantum of resources that go into technology, especially in the identified priority areas of agriculture, industry, health, environment, forestry and environment. Such an approach if feasible could take care of India's economic and development concerns without jeopardising her current national security concerns.

The success of the economic reform programme in making India globally competitive would depend on how effectively these ideas can be translated into pragmatic plans of action that are closely linked to market forces.

Appendix
BASIS FOR PREPARATION OF TABLE 2 AND
FIGURES 2 AND 3

(1) For converting rupees into dollars and vice versa the conversion rate used is Rs30 per dollar.

(2) The basic financial data for the various areas have been compiled from *Expenditure Budget, Volume 2*, for the periods 1988-89 to 1994-95, published and presented to parliament by the government of India. For defence, the allocations have been compiled from the annual reports of the Defence Research and Development Organisation (DRDO) published by the ministry of defence, government of India, for the period 1988-89 to 1993-94. For arriving at the allocations for health, forestry and environment, operational components have been taken out from the budgets of these departments. Only the education, research and technology components have been included. Data from *Research and Development Statistics 1990-91*, published by the department of science and technology, government of India, have been used for cross checking.

(3) The value of Indian defence production is taken from the ministry of defence *Annual Report 1993-94*. World production of arms and world trade in arms are taken from the Stockholm International Peace Research Institute *Yearbook 1994*.

(4) The value of domestic production of atomic power plants is based on the projections given by R Chidambaram in 'Nuclear Power - Good Beginning for the Next Phase', *Hindu Survey of Indian Industry 1993*. According to this, 2,000 MW of nuclear power additions are likely to be commissioned by 2000 AD. This has been distributed over a six-year period with a value of Rs 4 crore per MW.

World projections for atomic energy are from the International Atomic Energy Agency (IAEA) *Yearbook*. Seventy-two reactors with a total capacity of 25,000 MW are expected to be commissioned by the year 2000. This has been converted into an annual value using a cost of \$ 1 million per MW.

(5) To estimate the value of space production, one INSAT II kind of satellite (valued at Rs 300 crore) is assumed. The cost of INSAT II including launch is assessed to be in the vicinity of 280-300 crore. World production and trade figures are from 'Space Industry - the Scene in 1992' which is a summary of Euro-consults' 'World Space Industry Survey, 10 Year Outlook', published in *Space Policy*, August 1993.

(6) The size of the agricultural market is estimated on the basis of personal consumption data from the GNP statistics for 1991-92. World production of agriculture is based on a 9 per cent share for agriculture of the world GDP estimate of 22 trillion

dollars for 1992, taken from *World Development Report, 1993* published by the World Bank. Trade figures for agriculture are 1992 figures taken from *World Trade Statistics* published by GATT, 1993.

The Indian production figure for industry is the value added component for manufacturing for 1991-92 taken from GNP estimates with the values of electronics production (9,700 crore) and drugs (4,500 crore) taken out. The world production value is derived as 40 per cent of world GDP based on *World Development Report 1993*, published by the World Bank. From this figure 750 billion dollars for electronics, 220 billion dollars for drugs, 200 billion dollars for environmental equipment, 661 billion dollars for defence have been taken out, to take care of double counting problems. World trade for industry is taken from *International Trade Statistics* published by GATT, 1993, which estimate this at 2,653 billion dollars. From this, trade in electronics, defence, environmental equipment, space, etc. have been taken out to arrive at the figure shown.

(7) The value of the domestic market for health is derived from consumption data for 1991-92 given in *National Accounts Statistics*. World demand for health services is from 'Investing in Health', *World Development Report 1993*, published by the World Bank. The projected trade is an estimate.

(8) For non-conventional energy, based on a review of available data, annual addition of 50 MW of wind power (Rs 3.5 crore per MW), 2 MW of solar power (at Rs 450 per watt), and about 20 MW of biomass power (at Rs four crore per MW) are assumed to arrive at the value of Indian production. World production figures are from the published literature of the Energy Power Research Institute, US.

(9) Value of Indian production of electronics is from 'Welcome Pickup in Electronics Output', *The Hindu*, May 17, 1993. World production figures are from 'World Electronics Market to Cross \$ 940 Billion', *Business Line*, March 31, 1994. These are based on projections made by the American Electronics Association. This has been interpolated to 1994.

(10) For domestic production the value added component from the forest sector for 1991-92 based on GNP statistics is used. World trade in firewood has been estimated at \$ 7 billion by the World Bank. (See box 6.2, 'The Future for Improved Stoves Programme', *World Development Report 1992, Development and Environment Report*, published by the World Bank.

(11) In view of the fast changes in the biotech area, current data are sketchy. The projections used are based on *The International Handbook of Biotechnology 1988*, published by Euro Monitor

Publications, London. Various available projections appear to be consistent in projecting a market of 50-100 billion dollars by the year 2000.

(12) Value of world and Indian production of environmental services is taken from 'Air Pollution Control Systems - Growing Indigenous Capability', *Hindu Survey of Indian Industry 1993*. For specific requirement for each industry see Table 6.2, p 128, of *World Development Report 1992*. The value of world trade is assumed as 10 per cent of world production.

(13) To arrive at Figures 2 and 3, industry and electronics have been clubbed. Forestry and environment have also been combined. The allocations for science and technology have been apportioned between environment (170 crore) and industry (140 crore). Bio-technology allocations have been distributed equally between agriculture, health and environment. Non-conventional energy has been left out.

Notes

[I would like to thank N Gopal Raj of *The Hindu* for helping with this article, and S Murali for secretarial help]

I also thank the department of science and technology (DST) and TIFAC for funding a research project on technology priorities for India, the work on which has helped in preparing this paper. The views expressed in this paper are the author's own and do not reflect the views of DST, TIFAC or the Indian Institute of Management.]

UNSNA 1993 and Indian National Income Accounting Procedures

Some Emerging Issues

Arun Ghosh

The new UN System of National Accounts 1993 (UNSNA) finalised after several years of deliberation and discussion and now published jointly by five international organisations, is predicated to a particular system – it needs to be looked at carefully by each country and suitably modified in the light of its own institutional framework of economic activity. It is to be hoped (a) that the UNSNA will provoke a debate among experts in this country on some aspects of the definition of 'income' and the 'production boundary' and (b) that the Indian national accounting system will not be changed in undue haste to fall in line with the changes suggested in the UNSNA without regard to the institutional framework of production activity in the country.

THE new UN System of National Accounts (SNA) 1993 was finalised after several years of deliberation and discussion by an international group of experts, and in the light of comments sent by member governments and expert bodies like the Indian Association for Research in Income and Wealth (IARNIW) on a draft set of proposals – especially on the concept of 'income' and on the set of accounts – and finalised in consultation with the IMF (especially in regard to international flows and financial statistics) and the World Bank. The document, now published jointly by five international organisations is supposed to provide the guidelines for member governments for revision of their national accounting systems and for drawing up their own national income and other related accounts in line with the SNA.

Since of late the tendency within the government of India has been to kowtow to any suggestion emanating from international organisations dominated by the west since bodies like the official Advisory Committee on National Accounts no longer have the advantage of advice and guidance from internationally renowned experts like Mani Mukherjee and V M Dandekar, it may be useful to focus on a few salient issues, particularly in relation to the concept of 'income' (and its valuation) and to raise a debate on some relevant issues. Hopefully the Central Statistical Organisation, wherein vital technical decisions are now taken by bureaucrats rather than by technical experts (in the Department of Statistics), will ponder before precipitately accepting the SNA (1993) in its entirety. Be it stated at this juncture that India has so far consistently adopted a system (and definitions) somewhat at variance with the earlier SNA (1968) with good and justifiable reasons.

It should also be stated at the outset that the SNA 1993 has turned out to be a much more reasonable document than the earlier

(somewhat one-sided and haughty) draft proposals (which had evoked a strong critique from the IARNIW). The SNA now accepts the need for flexibility and for somewhat different approaches by member countries as may suit them, particularly with reference to their stage of development, the degree of sophistication of instruments of production (especially in the matter of financial instruments) and data availability. The 1993 SNA turns out to be a much more gentle and acceptable document than the earlier overbearing draft proposals circulated among member countries in the late 1980s/early 1990s.

PRODUCTION BOUNDARY

Having said this, a few comments on the concept of income (and the treatment of some institutional sectors) – and in particular the definition of the production boundary – need to be made. But before entering into that discourse, perhaps agreement on a major issue – which had earlier cropped up during the discussions stage – must be recorded.

The SNA clearly sets at rest the issue of production of services for own use. There was also the problem of valuation of self-consumed goods. Self-consumption of commodities is to be treated as within the production boundary; this is clearly an obvious need in a primarily agrarian economy where there is much subsistence production and obviously it would be incorrect to exclude from output, and therefore from the national accounts, the value of foodgrains (and other final products) consumed by the producer household.

There has been considerable debate as to whether 'services' produced and consumed by the household should also similarly figure in the National Accounts. The household chores of a housewife figure prominently in this debate and the SNA (1993) has (perhaps wisely) suggested that *all* services directly

consumed by the producers should be kept out of the production boundary.

This does present some problems of comparability between an economy where such services are by and large performed by hired help – wherein these 'services' would be part of the aggregate national output – and an economy where such services are performed in house, say within the family. Perhaps this definition may also irk some women activists who may feel that women's role in the nation is not properly recognised because of this definition. But we must try to understand the purposes for which national accounts are drawn up – and if the major purpose is to obtain data on economic activity in an economy for macroeconomic policy-making, this sharp distinction between self-consumed goods and services would appear to make sense.

VALUATION OF SUBSISTENCE OUTPUT

There does arise, however, a problem in regard to the valuation of 'subsistence' output of commodities. (Incidentally, construction of dwellings for own use is treated as within the production boundary – even though dwellings provide a service – but let us not enter into that debate here because this has been justifiably so right from SNA 1953.)

What is the problem of valuation in regard to the output of self-consumed commodities? The SNA 1993 suggests the use of 'basic prices' or 'producer prices' (the latter inclusive of taxes *minus* subsidies), whichever may be readily available. The National Accounts Division of the CSO uses 'producer prices' or some approximation of the same – for this purpose though the National Sample Survey (NSS) uses 'retail prices' as available in each area, for estimating the value of self-consumption of food in rural areas. The use of retail prices by the NSS appears to be justified because the NSS

continues its survey round the year, and in the event the value added by 'storage' gets included in the figure of self-consumption over the year. Yet ideally if we could get rural producer prices all year round that may reflect better the value of self-consumed output. Storage imparts a definite value to output. Any seasonal product becomes, economically, a different product at different points of time in the year - this is recognised and, in fact, accepted by the SNA - and thus the use of retail prices in the NSS gets justified as being closer to reality. One can, of course, add that there can be no 'trade margins' for self-consumed output and in any case, self-consumed services are not to be included within the production boundary. Since self-consumed services are not to be included within the production boundary, the use of retail prices could overstate the value of consumption. The issue herein is to what extent do the retail prices used by the NSS include a retail margin? If the margin is not large (in rural India), the problem is one of semantics. How exactly are the retail price data compiled/computed? Perhaps this issue is best left to the Advisory Committee on the NSS so that the valuation of self-consumption of foodgrains can get properly settled. To the extent the NAD estimates self-consumption at producers' prices at harvest time, the value of self-consumption in the national accounts can only be understated, not overstated, by the storage costs (or the difference between producers' prices at harvest and the rest of the year).

In the above context we need to note that the concept of basic prices would not work; it would be impossible to segregate the 'subsidy element' (on electricity on irrigation water on fertilisers) from the producer price of different crops, hence, there is no possibility of use of the 'basic price' (suggested by the SNA). All in all, we have the best *compromise* in the use of producer price in the production account of the National Accounts Statistics (NAS), and the use of retail price for measuring consumption (of self-produced output) in the NSS.

During the discussion stage - as suggested in one of the draft proposals - there was wide support for evaluating the labour spent (in developing countries for collecting fuelwood and water within the production boundary. This had been strongly opposed by the IARNIW because then what is a hardship for the poorest would get reflected as income and consumption (the valuation of such labour being at market prices). Fortunately, this suggestion has been abandoned in the final SNA 1993, only commodities with a market price are evaluated (at the market prices). Incidentally, if the suggestion of evaluating all labour (for

commodity production) were to be accepted, we could have an enormous increase in the (imputed) value of output of the poorest. Indeed, in real life, for a 'marginal farmer', there is a negative profit (*a la* Chayanov's theory of the peasant economy). The value of labour in the present framework becomes irrelevant when we measure all output at producer prices. We are not really evaluating the output in terms of the labour spent (valued at market wage rates), but the output self-consumed by the producer, valued at the producer's selling price.

The above point may appear to be irrelevant in the context of SNA 1993, but is still repeated here because there is nothing inherently sacrosanct about the SNA and some of the proposals in the SNA 1993 still appear to be quite irrelevant in the context of the framework of the Indian economy. Indeed, it is worth stressing that if national accounts are to serve any policy purpose, they need to be devised in the context of the *institutional framework of the organisation of economic activity in the economy* for which national accounts are being drawn up. Concepts and definitions (suggested by the SNA) need to be amended/modified suitably in this context.

PROBLEM OF ILLEGAL PRODUCTION

The first problematic issue arises from the fact that the system (i.e. SNA) includes the production of *all* goods within the production boundary (emphasis added para 6.24) and despite the obvious practical difficulties in obtaining data on illegal production it is included within the production boundary of the system' (para 6.30).

The problem herein arises from the fact that there are two kinds of 'illegal' production. There is production which is legal, but tax evaded and therefore done illegally. Clearly every attempt should be made to measure such output, no matter what difficulties of estimation are encountered. But then there is also wholly illegal economic activity (and production) in areas which are (quite justifiably) banned, e.g., the production and sale of narcotics. The SNA recommends that even the latter should be included within the production boundary because one way or the other, funds are being deployed for such production activity, incomes are being generated (and spent on consumption or for capital formation), and exclusion of such activity would then indicate larger funds being deployed on the (smaller volume of) legal production activity.

The latter argument may have some relevance in regard to 'flow of funds' analysis. On the other hand, it is not clear that the funds being deployed in such activity are necessarily part of the 'domestic

monetary circulation' within the country concerned. At any rate, in today's world, there are lots of activities like gun running, terrorism, kidnapping (for extortion of a ransom) which get financed one way or another, but which cannot be conceived by any stretch of imagination to be part of the 'production boundary' within any economy. Let us remember that such services are not 'self-consumed'. Perhaps a distinction needs to be made between tax-evaded or otherwise unauthorised production, and criminal activity which still leads to the generation of an income - maybe a large income - for some criminals. Thefts and robbery can, of course, be dismissed as involving an income transfer (maybe involuntary), but criminal activities of the type mentioned, which directly lead to the generation of incomes, are not activities which the national accounts *ought* to recognise.

The borderline case is of prostitution which is not 'illegal' in many countries, yet not so far covered in the national income accounts (in India). Like tax-evaded production of commodities, this is a service which, in theory, can justifiably be included within the production boundary. One need not take an ethical/moral view of national accounts. And yet clearly *criminal activities* which are to the detriment of a country, should not perhaps be included within the production boundary. Even though the size or growth of the national income does not indicate, *pari passu*, the growth of welfare, yet the common man continues to view national income growth as a positive indicator of greater welfare. Certainly, there is need for a debate on this issue before the CSO adopts the SNA in this context, for the SNA gives as examples of activities which should be included in the production boundary, "the manufacture and distribution of narcotics, illegal transportation in the form of smuggling" (para 6.32).

VALUATION IN A 'THIN' MARKET

There is a second issue, in regard to the 'valuation' of income from owner-occupied dwellings, where the SNA recommendation does not appear to be valid, at least for the Indian economy. The SNA states that "as well organised markets for rented housing exist in most countries, the output of own account housing can be valued using the same kind of services sold on the market" (para 6.89). This is not only impractical for all rural housing in India, for no 'market' really exists for such housing, there are theoretical problems that arise even in urban areas with a substantial market for rented dwellings.

The problem is, briefly, that in a market which is 'thin', the market price is not the best indicator of an equilibrium price. This

is, in fact, a problem that one is familiar with in an economy with controls, the existence of a high black market price (for a commodity) in a thin black market is no indicator of the equilibrium market price for the commodity, were all controls to be lifted. And yet one keeps on hearing of diverse types of estimates (e.g. of demand) being made on the basis of the black market price for the controlled items in question. One recalls that a few years back the long waiting list for passenger cars vanished overnight with a small increase in availability, and that phenomenon has been observed for many commodities (in temporary short supply).

In short, it is the size of the market for dwelling houses – in relation to the population of dwelling houses – which becomes an important desideratum in a decision concerning the valuation of owner-occupied dwellings. More importantly, in metropolitan areas today, the perks granted to corporate executives make the market price of rented out dwellings excessive. Take away the perks regarding fabulous rentals paid by companies for their executives with a mere 10 per cent of the salary deemed as the additional income for tax purposes, and the rent of dwellings will come tumbling down. The observed rentals are no indicator of the equilibrium market rents of dwellings in urban India.

In other words, one has to examine the ground conditions in each country, examine the appropriateness for a developing country of a suggestion which emanates from the experience of developed countries (where there is a broad freer market for dwellings) before blind acceptance of the system in its entirety.

TREATMENT OF CENTRAL BANK

This last issue is best exemplified in relation to the next – and a major – problem with the SNA, that pertaining to the treatment of the central bank. In our case, the Reserve Bank of India.

This issue is a long-standing one with a long controversy behind it within India. Perhaps it would be well to elaborate on the issue with a brief historical explanation of the Indian position *vis à vis* the SNA position (all the way from 1953 through 1968 to 1993). The central bank in the SNA is treated as a part of the 'banking sector'. As a result, the net output of a central bank is also treated in the same manner as that of any commercial bank, and there the story ends.

Of course, in every country, the central bank is in charge of monetary policy. But the income of the personnel deployed for laying down monetary policy is minuscule in relation to the total activities (and income) of the banking sector as a whole. So, for the

sake of convenience, in the SNA the tail is not allowed to 'wag' the dog: the net output of the central bank is derived in the same manner as the net output of commercial banks.

Incidentally, the SNA 1953 – devised by Richard Stone – recommends this procedure and this has been followed by SNA 1968 and now by SNA 1993.

In 1950 when the present writer was preparing the first official estimates of the national income of India (on behalf of the National Income Committee consisting of P C Mahalanobis, D R Gadgil and V K R V Rao with Simon Kuznets, Richard Stone and J B D Derksen as Advisers) he came to take a slightly different stand. The Reserve Bank of India had at that point of time two departments: the Issue Department and the Banking Department and the present writer then decided that the Issue Department would be treated at par with government administration and the Banking Department would be treated at par with the banking sector.

Incidentally, after considerable discussion and an examination of the accounts of the Reserve Bank of India at that point of time, Richard Stone agreed with and approved of the above approach. That was how the Indian national income accounts came to be drawn up for the *First Report of the National Income Committee* in 1951 and that approach is still adopted for drawing up India's national accounts.

Time does not stand still. Over time the activities of the Issue and Banking Departments of the RBI have overlapped (in the sense of financing the deficits of the government of India) and the profits of the RBI have soared as a result of the large borrowings of the GOI from the RBI. The moot question that arises is: are the profits of the Reserve Bank commercial profits, or are they of the nature of savings extracted by government from the people of this country?

Came the K N Raj Committee in the late 70s (*vide Report of the Working Group on Savings in India*, 1982) and the economists (particularly from the Reserve Bank of India) in that committee argued forcefully for a change in the Indian system of accounts, and for treating the RBI as a part of the banking sector. It is an understandable human weakness: this desire of RBI officials to show the RBI as making large, commercial profits, and after all, they have the backing of the SNA! No one today cares that Richard Stone, who devised the first SNA, agreed that a different treatment of the central bank was justified for India. The then Advisory Committee on National Accounts – of which the late V M Dandekar was the chairman and Mani Mukherjee a member – rejected the recommendation of the Raj Committee

on this issue. In fact it was then suggested (by the present writer) that of the eight or nine clearly specified functions of the Reserve Bank, three were clearly of the nature of banking or commercial activity (bills discounting, accepting/operating deposit accounts of state governments et al, and at present perhaps also forward trading in foreign exchange though the last function is a problematic one) while all the other activities were clearly 'administrative'. It was then suggested (by the present writer) that the RBI prepare a break-up of total salaries and perks of the personnel deputed for these tasks as a proportion of the salaries and perks of total personnel and then classify the income of the RBI from the expenditure side. (A better alternative would be to look at the income side directly from this angle, the RBI may become almost wholly of the nature of government administration for the income from bills discounting is minuscule, and exchange management ends up in a loss, with large profits arising from the interest on GOI securities arising from the deficit financing indulged in by the GOI.)

When for example the RBI governor decides on monetary policy, curbs, how is he any different from the finance minister of India who decides on policy questions? At any rate, looking at the income side, perhaps 99 per cent of RBI income arises from the deficit financing of the centre.

I look at it this way: Suppose the government of India were to issue all currency notes from Rs 10 to Rs 1000 denomination – directly would there be any assets of the RBI (other than foreign exchange assets which are also held on behalf of the government)? And what would then be the income/profits of the RBI? Would the income from bills discounted etc. exceed the losses on forward exchange risks? Indeed, would RBI have even the funds to engage in large-scale open market operations, which it has to undertake for policy reasons? With losses on these operations rather than profits?

Today the operations of the Issue and Banking Departments do overlap. The present NAD classification of RBI accounts is therefore economically incorrect. The financing of central government deficits is really managed by the Banking Department as of today. So the earlier NAD distinction between the Issue and Banking Department – and treating the former as Administration and the latter as commercial activity – is no longer valid. But would it be correct to treat the RBI as a commercial entity? Would it be proper to define RBI surpluses as 'enterprise profits'?

Perhaps one ought to quote some figures from the Annual Report of the Reserve Bank of India for 1994-95 (July-June), in the above context. The report cheerfully lumps together all income from interest and from

***What are the major obstacles to development in poor countries?
What is the role of a country's institutional arrangements in
economic development? What is the appropriate role of the
government in the development process?***

On Thursday, November 16, 1995 at Shahjahan, Hotel Taj Palace in New Delhi, the Center for Institutional Reform and the Informal Sector (IRIS) and the National Institute of Public Finance and Policy (NIPFP) aim to answer these questions and others at their conference on

**THE NEED FOR GOLDBLOCKS
GOVERNMENT:
Some Implications of the Collective Choice
Approach for India**

"Then Goldilocks sat down in the chair of the Great, Huge Bear, and that was too hard for her. And then she sat down in the chair of the Middle Bear, and that was too soft for her. And then she sat down in the chair of the Little, Small, Wee Bear, and that was neither too hard, nor too soft, but just right."

The Story of Three Bears

Distinguished panelists from the United States and India, including Dr. Robert Cooter and Dr. Bradford DeLong of the University of California at Berkeley, and Dr. Ashok Desai, Mr. Swaminathan Aiyar and Dr. Amit Mitra, will address these issues in a day-long session of economic and political discourse.

For further information, please contact: Ms. Bina Koshy, Genesis PR, Tel: 674 372, 674 614, Fax: 688 1733, 611 5790.

discount and exchange commissions, etc. Total interest (and other) income in the year ended June 1995 was Rs 9,222 crore. Of this, Rs 1,503 crore were transferred to Contingency Reserve. Interest payments to scheduled banks were Rs 2,864 crore, payment to government (for payment to the IMF) amounted to Rs 2,151 crore. Establishment costs were Rs 514 crore, and diverse other costs Rs 488 crore. The net disposable income of the RBI in 1994-95 – after all costs and transfer to Contingency Reserve – was Rs 3,562 crore. The surplus transferred to government was Rs 3,558 crore, out of which Rs 2,058 crore was to go towards meeting the losses on Foreign Currency Non Resident Account (FCNRA) incurred by the government (for compensating commercial banks).

Regrettably, the Income Statement gives no break-up of interest income from rupee securities and income from discounting business and from exchange commissions. But can one imagine a profit of Rs 3,562 crore (plus the transfer to Contingency Reserve of Rs 1,503 crore, or a total of Rs 5,065 crore) as commercial profits of the Reserve Bank?

Incidentally the government incurred a loss of Rs 2,058 on the FCNR account that is *not* a commercial loss, but a loss incurred because of a policy decision. In short, the RBI is essentially like a tail of the government of India: the RBI profits are *not* enterprise profits; they are savings eked out from the economy *via* deficit financing. The RBI merely provides the operating mechanism for the process.

One may legitimately ask as to why this point has been laboured in such detail. The reason is simple: there has been enormous pressure in the past for the CSO to toe the SNA line in this regard and to treat the RBI as part of the commercial banking sector. With the present thrust for globalisation, the bureaucrats calling the shots in the CSO may find it convenient to switch over to the SNA 1993 in regard to the treatment of the RBI. That may tickle the ego of RBI economists, that the Bank has made such large *profits*. But it would be an unfortunate decision, a wrong decision, an economically unjustifiable decision.

One should perhaps add, in the same vein, that the losses of the Food Corporation of India are *not* a commercial loss, they are losses incurred for a policy purpose, as such they ought to be classified as a subsidy. RBI profits and FCI losses are both outside the ambit of enterprise profits/losses. (One is not concerned here with the supposed efficiency/inefficiency of FCI, by that criterion, *all* inefficient enterprises – and they are aplenty in all countries – would have to be specially treated, as involving a 'subsidy' rather than as showing operating losses. By

the same token, government administration also provides a large variety of public services; however *by convention* the net output of Government Administration is taken as equal to the wages and salaries paid by the government. Should *these* services be treated in a manner different from present conventions? In short, national accounts are based on certain conventions but then we should endeavour to keep the estimates of the GDP as close to reality as possible. The institutional framework of the economy must be kept in mind in this context.

VALUATION OF INVENTORIES

There arise certain other, more subtle problems with the SNA 1993. Take the statement that for 'a good whose quality improves while being stored (e.g. wine) storage can be regarded as work in progress' (para 6.107). Conceptually, this is fine but such refinements can distract attention of national accounts statisticians from more important problems of data collection, verification and validation. As a matter of fact, this point is of some importance for developing countries: subtle refinements – recommended by the SNA – do divert attention from more urgent tasks, and where there is a constant flow of aged wines one can take their sales adjusted for inventory changes as the output. Storage costs get deducted as a part of costs, and as value added by storage. Since there exist standard procedures for the valuation of inventories, the problem is thus got rid of, without going into the subtleties suggested. Since storage – especially of wines – can be quite costly and a future value of vintage wines today can be quite misleading, the difference between the present value (when the wine is not marketed at all) and likely future value can be a misleading concept. 'Value' arises when the wine is sold, and the circumstances of demand and supply say five to ten years from today, are wholly unpredictable. Since the *quality* of wines varies greatly not only with age but also with the *year* the wine is produced *and* the vineyard, the refinement suggested can be misleading. A good wine-maker never markets any but aged wines, and market prices of wines also vary significantly over time. Thus a procedure which is valid for, say, equipment manufacture, cannot be applied for a good whose quality improves with storage' and where the value keeps changing depending on market perceptions, demand for vintage wines and the supply of alternative wines. The valuation of 'wines' is best attempted on the basis of market price, when marketed, subtle refinements may lead us into a maze.

The above has been laboured because, while the SNA is quite correct when it states,

for agricultural produce that "goods withdrawn from storage some months after the crop is harvested are economically different from those that entered" (*vide*, para 6.108) the answer lies in evaluating each good as it is marketed (to the extent possible) and in avoiding wholly *arbitrary* allocations of value added in respect of work in progress. Again this point is being laboured merely to warn statisticians of developing countries that they need to set their own priorities of data collection and analysis and not get overawed by interesting issues that arise for say wine makers from France, Italy and the Iberian peninsula.

HOLDING GAINS

A much more important issue – both in theory and in regard to policy uses of national accounts – arises in the context of holding gains, which of late have been assuming increasing importance in all countries, owing to the proliferation of speculative finance capital around the world. There arises of course the tricky practical problem of calculating real holding gains – that is, nominal holding gains adjusted for inflation. What price index does one use for deflating nominal holding gains? The SNA 1993 recommends the use of an index of the *general price level* and in the absence of such a ready-made index the retail consumer price index. The issue is tricky. When the holding gain arises in respect of a capital asset (for purposes of revaluing say, equipment) one should use the index of the price for that particular equipment; that, in principle, is the basis of revaluation of assets by corporate manufacturing entities. One can therefore distinguish between three types of assets: directly productive assets, inventories and financial assets, all of which can be subject to holding gains' and while the revaluation of inventories is straightforward and easy, the revaluation of durable assets is tricky yet still reasonably easier: it is the revaluation of financial assets which calls for special mechanisms like the use of an index of the general price level or in the alternative the use of the retail price index.

But there arise some other conceptual problems in this context. 'Holding gains' arise very significantly in the course of trading operations. But can one really segregate, for pure trade, holding gains from normal trading profits? In particular, how does the national accounts statistician deflate trading margins (or trading incomes which are very approximately estimated anyway)? There is no doubt that a substantial part of trading profits does arise, in the real world, as a result of 'holding gains', but it is also the trader's job to hold inventories, and to distribute products to consumers, and the

trick sometimes makes monopoly profits' in times of scarcity (offset by losses when there is a depression in consumer demand) and sometimes holding gains which arise from inflation. Is it possible to distinguish between monopoly profits and holding gains? Since, as per national accounts, the market price reflects for each product at each point of time the value of the product (for national accounts purposes) one can at best attempt to track deflator (for trading incomes) based on the rate of overall inflation and the aggregate trading income at current prices. But then to derive real income growth one deflates in any case, so how does one separately convert nominal holding gains in the trading sector into real holding gains? In practice, this could turn out to be a delusion.

REAL AND NOMINAL GAINS

There arises yet another set of issues. The concept of holding gains appears to be simple yet the calculation of real holding gains (adjusted for inflation) can be very tricky. As the SNA correctly observes, *It cannot be assumed that such real gains and losses cancel each other out even in a closed economy* as it is possible that asset owners benefit at the expense of units that do not own any (emphasis added para 12.80). This implies that a set of producers reap holding gains (in real terms) at the expense of consumers (or say stock brokers gain at the expense of ordinary shareholders). This leads to a transfer of real purchasing power from one group of persons to another which is extremely difficult to trace from the accounts of all producing agencies. These lead to *income changes* among sectors/segments of the population.

Unfortunately the SNA 1993 leaves this issue inconclusive. There is no clear cut recommendation in regard to the treatment of holding gains as part of income. In fact, the *implied* suggestion appears to be to transfer all holding gains to the assets account (in practice the revaluation account for there can be no real asset formation except out of current income). The SNA acknowledges that real holding gains are important economic variables in their own right that need to be taken into account as well as income for purposes of analysing consumption or capital formation. The SNA goes on to add 'it can be argued that real holding gains ought to be assimilated with income as defined in the system to obtain a more comprehensive measure of income but there is no consensus on this' (emphasis added para 12.81).

Let us look at the problem this way. Nominal holding gains (i.e. holding gains unadjusted for inflation) are becoming increasingly more important in every economy in fact if the volume of transactions

in the stock exchanges is any guide, the recent trend among many investors appears to be to shift from making a steady income to making quick capital gains. Such capital gains do affect incomes, consumption, savings and deployment of savings, (either to capital formation or to speculation). The SNA has focused on the importance of measuring illegal incomes for correctly allocating the deployment of funds in an economy and is of today *nominal capital gains are becoming increasingly more important in determining income consumption and the deployment of funds* in respect of an ever growing number of the urban middle classes. Thus the calculation of nominal holding gains of one segment of the population (against nominal holding losses of another segment) becomes an important task of the national accounts statistician. The computation of real holding gains bristles with difficulties because the concept of the *general price level* is elusive and perhaps even the retail price index is not relevant in this context. But the SNA focuses on only 'real holding gains' and not on nominal holding gains and it is suggested that the latter ought to concern the national accounts statistician for holding gains are today important, and getting to be increasingly so.

Holding gains ought to be classified as part of income (and holding losses deducted from income) when we estimate GDP at current prices in order to reflect the resource flows and the distribution of real output in the economy. A large part of the income of 'brokers' today arises not from brokerage fees but from holding gains. And 'holding gains' become important for both enterprise and for trade during inflation. It would be an error to miss out on this important development in India today.

MARKET FETTER

Two further points are in order. First in regard to debt transactions, the SNA has this to say: write downs that reflect the actual market values of financial assets should be accounted for in the revaluation account. However write-downs/write offs that are imposed solely to meet regulatory or supervisory requirements and do not reflect the actual market value of those financial assets should not be recorded in the SNA (para 11.23). The second sentence in the above quotation is intriguing. A write down (of bad debts) imposed by a regulatory authority (say on a bank) is *normally* taken care of in the profit and loss account and therefore affects the balance sheet only indirectly. And in most countries the market for the equity of banks (most of which in India are state owned) is not well developed.

It is this fetish with the market system which occasions this recommendation, and in the event of an *enforced* write down of capital (whatever the reason) due note should be taken of the fact in the assets revaluation account.

Finally the SNA has recommended that consumption of fixed capital should not include losses due to unexpected technological developments that may significantly shorten the service lives of a group of existing fixed assets' (para 6.187). This recommendation is inconsistent with the very concept of the GDP in a market economy (especially in a world of rapidly changing technology and higher obsolescence). Indeed this recommendation is inconsistent with the recommendation of the Perpetual Inventory Method (PIM) for the calculation of capital consumption in the SNA. In information technology for instance the life of a new invention/innovation may today be only between three to five years though one may have started a project expecting a 10 year life. Capital in market economy is what capital does and the value of capital at any point of time is the (discounted) value of future streams of income expected from capital at any point of time. (In fact the entire basis of the revaluation of capital under the PIM is this principle.) Hence this particular recommendation of SNA 1993 appears to be inconsistent with its own approach in regard to the valuation of capital.

To conclude the brief point one should emphasise is that the UNSNA is a *suggested framework* indeed the SNA acknowledges that at best it represents a stage in the evolution of national accounting and that 'however simple and precise concepts and classifications may appear in principle there are inevitably difficult borderline cases which cannot easily be fitted into predetermined categories' (para 1.48). The SNA is predicated to a particular system it needs to be looked at carefully by each country and suitably modified in the light of the *Institutional framework of economic activity* in each country.

This essay concludes with the hope that (a) it would provoke a debate and a discussion among experts in this country on some aspects of the definition of 'income' or the production boundary in SNA 1993 and (b) that the Indian national accounting system – on which technical decisions will finally be taken by the government that is by some bureaucrats – would not be changed in undue haste to fall in line with all the changes suggested in SNA 1993 without regard to the institutional framework of production activity in India. There is always that danger when technical recommendations are packaged in a document emanating from international organisations.

Conservation in India: A New Direction

Ashish Kothari
Saloni Suri
Neena Singh

The ongoing debate about the justification, planning and management of India's wildlife protected areas between the wildlife conservationists and human rights advocates overlooks the fact that both wildlife and local communities are today equally threatened and have a common adversary in elitist state policies and the urban industrial development process. This article argues that a reconciliation between the two is possible if local communities and government agencies evolve a partnership in conserving the habitats with critical support from NGOs and independent researchers.

Don't the wild animals (and plants) have a right to at least a small part (4 per cent) of the country as their exclusive home, undisturbed by humans?

S. Singh (1994)

A poor country like ours cannot afford the luxury of keeping thousands of square kilometres of land under forests and wildlife sanctuaries at the cost of millions of people.

M. D. Mistry (1995)

THE starkly contrasting statements above represent an increasingly bitter debate about the justification, planning, and management of India's wildlife protected areas. On one side are forest officers, urban conservationists, wildlife ecologists, and on the other side social activists, local community representatives, human rights advocates. As the wildlife versus people debate rages, what seems to be lost to the extreme elements on both sides is the fact that both wildlife and local communities are today more threatened than ever before, that they in fact have a common adversary in elitist state policies and the urban industrial development process, and that only a reconciliation between the two will be able to counter this adversary. It is this reconciliation that some conservationists and social activists on both sides are trying to seek, and which we propose to explore below in the specific context of habitats protected for wildlife.

India has an extensive network of about 500 national parks and sanctuaries, covering some 4.3 per cent of its territory. Though a small percentage, these areas are today the hub of what little is left of the country's natural habitats and wildlife. They are also home to some of India's most traditional communities. Finally, they are also the repositories of some of the country's most valuable forest products, minerals, and other resources which our rapidly expanding industrial-urban economy needs. These protected areas (PAs) thus mean different things to different people, and therein lies

the locus of a simmering cauldron of conflicts.

In PA after PA, a variety of issues has surfaced over the last few years, including conflicts between villagers and government, between villagers and commercial forces, and between conservationists and commercial forces. In places, local communities are totally rejecting the official concept of protected areas and are even willing to sacrifice the forests and wildlife for immediate gains; in others they are struggling to conserve these habitats along with government officers, with the recognition that only this will secure their own long-term livelihood; in yet others they are themselves protecting habitats with an explicit rejection of any government involvement, and finally in some hold forest officers and NGOs are standing in the way of destructive commercial interests.

Any generalisation of the PA situation in India is hazardous. Some brief examples will illustrate the complex reality. (i) In the early 1990s, Gujarat dereserved the Narayan Sarovar Sanctuary to make way for limestone mining and a cement factory. The sanctuary had been declared two decades ago by the same state government to protect one of the last large stretches of coastal thorn scrub habitat and a large population of the threatened Indian gazelle, *Gazella gazella*. But while there was immediate protest from conservation NGOs in India, a substantial number of villagers came out in support of the denotification. Their argument: the sanctuary status had only meant restrictions on their access to resources, and the forest department, which manages the area, had done nothing for them. Industrialists were bringing them promises of jobs, 'who were conservationists standing in the way?' (ii) In the same state, tribals have been demanding the denotification of Shoolpaneshwar Sanctuary, where forest officials were harassing the villagers for collecting traditional forest produce, while simultane-

ously allowing a paper mill to harvest large numbers of bamboo! The tribals argue that the sanctuary only means trouble for them and in any case does not help in conserving wildlife, since commercial interests and outside poachers are allowed in. (iii) In and around the Sariska Tiger Reserve, Rajasthan, mining companies had come in with promises of employment to villagers. However, Sariska's villagers soon realised that the mining was only enriching the contractors and owners, employing very few local people, while destroying their forests, fields, and waterways. Tired of the inability of the government to stop the mining, the villagers obtained a court order to close down the mines and got it implemented by physically blocking the mine owners' operations. Interestingly, their motives were not purely selfish; they repeatedly said that they were also fighting for the continued existence of the tiger and its habitat. (iv) Close by, in the Kaila Devi Sanctuary, part of the world-famous Ranthambhor Tiger Reserve, there is a collaboration building up between forest authorities and villagers. According to the divisional forest officer in charge, the sanctuary is today protected mainly because the pastoralist villages inside have fought against illegal mining and are helping to keep out huge populations of migrant sheep which were earlier devastating the vegetation. In turn, the forest department has given control over some forest land to the villagers to develop as pastures. (v) Also in Rajasthan, inhabitants of five villages have declared 1,200 hectares of forest as the Bhairodev Dakav Sonchuri, promulgated their own set of rules and regulations, and are zealously protecting the area against any outside encroachments. Violations are dealt with by village councils, which have appointed a sonchuri warden. They proudly say that there are two leopards in the forest and are going to start an annual census of wild animals. Interestingly, one of their rules

disallows an overall growth in the livestock population (vi) In the rainforest tracts of Maharashtra, forest officers and local NGOs have kept out bauxite mining interests from the Radhanagari Sanctuary, by tactics such as digging up the road leading to the mining site! This resistance has so far been successful even in the face of extreme political pressure to start the mining (vii) In Orissa some local politicians and NGOs have stalled government plans to build a hotel complex in coastal Balukhand Sanctuary and fishing jetties for trawling adjacent to the Bhitarkanika Sanctuary which harbours the world's largest nesting congregation of the endangered Olive Ridley turtle Delhi based lawyers are providing legal support

The above examples are only a tiny sample of the crises and opportunities facing wildlife habitats in India. Though examples like Kaila Devi and Radhanagari shine out, collaboration in conservation is still a relatively rare story across the Indian countryside. The more frequent tale is that of people, wildlife and people-state conflict.

Current conservation policies and programmes in India do not seem to have solutions to these conflicts; indeed, as we argue below, they have often created the conflicts. It is in this difficult context that conservationists, social activists, and government officials are groping for answers before India's remaining natural habitats reach a stage of irreversible destruction.

INDIA'S THREATENED DIVERSITY

India has a combination of natural and cultural diversity which is matched by few other nations. The world's greatest range of altitude, rainfall, and geological conditions has given rise to an enormous diversity of forest, grassland, wetland, desert, montane and marine ecosystems. This habitat diversity supports a recorded figure of 81,000 animal species and 45,000 plant species [MoEF 1994], and possibly several times more yet undiscovered. India also has a culturally diverse population of over 900 million, with 4,635 distinct ethnic communities, 325 languages belonging to 12 language families, six 'major' religions and dozens of smaller independent faiths, three racially distinct resident populations and ways of life ranging from ancient hunter-gatherer to modern urbanism [Singh 1992].

This complex juxtaposition of biological and cultural diversity is no coincidence; the latter has arisen as a human adaptation to the former, and has in turn nurtured it. The widespread traditional practices of protecting patches of natural habitat ('sacred groves') and certain species, the myriad myths and

folklore representing animals and plants as ancestors and totems, lifestyles which were incredibly fine-tuned to the rhythms and limits of their natural surrounds, hunting practices which respected nature's limits in all these and other ways, local communities have expressed a profound understanding of their relations with nature [IIC 1992, Gadgil, Berkes and Folke 1993, Deeney and Fernandes 1992].

A whole host of factors have, however, led to a sharp decline in both biological and cultural diversity over the last few decades. What was once a relatively harmonious relationship between local communities and wildlife has soured due to forces external to both. The dominant elite in India has conventionally viewed such communities, their homelands and the wildlife inhabiting these homelands as resources to be subjugated and exploited. Declining local community control over natural resources (e.g. the takeover of forests by British colonialists), the commercialisation of these resources for the market, an unsustainable development process, and increasing population of humans and livestock, are major destructive factors.

Traditional customs, lifestyles and conservation ethics of people, are being broken by exposure to the so-called mainstream, which teaches them that unless they have material wealth, they are backward and primitive. This 'integration' into the mainstream has more often than not meant a place in the lowest rungs of society, usually as wage labour in the very development projects which have dispossessed them in the first place. All over India, the local community has been transformed from a relatively (though by no means as completely as made out by some romantics) independent, self-reliant and self-determining entity to one dependent on the vagaries of money markets, labour contractors and governments [Fernandes 1992, Sharma 1989].

The consequences of these forces have been disastrous for India's wild biodiversity as well. Over half of India's natural forests are gone, one-third its wetlands drained out, 70 per cent of its surface waterbodies polluted, 40 per cent of its mangroves wiped out, and most of its grasslands converted to fields or built over [IIPA forthcoming]. Literally thousands of species of plants and animals are heading towards extinction in India, no-one has a clear estimate, but official sources suggest that about 10 per cent of the flowering plants, 21 per cent of its mammals, and about 5 per cent of its birds are on this list [MoEF 1994, ZSI 1994].

Mammals like the cheetah *Acinonyx jubatus*, birds like the pink-headed duck *Rhodoneissa caryophyllacea*, and plants like *Madhuca insignis* (a wild relative of mahua, one of central India's most widely used trees) have already been pushed over the brink [ZSI 1994, Nayar and Sastry 1990].

HISTORY OF INDIA'S WILDLIFE RESERVES

It was in the context of this rapid decline in wildlife populations over the last few decades, that conservationists called for a national wildlife protection programme in the 1960s and 1970s. The thrust was towards protecting remaining populations of certain endangered species by banning hunting, giving legal protection to their habitats and restricting trade in wildlife. The Indian Wildlife (Protection) Act (hereafter referred to as WLPA) was promulgated in 1972, with various provisions for protecting habitats and an all-India list of protected species. There followed a virtual spate of declarations of new national parks and sanctuaries, the total increasing from 131 in 1975 to 496 today [Jena 1993, MoEF 1994].

This recent state-led effort at wildlife conservation has its predecessor in sporadic attempts by previous rulers of the country. Emperor Ashoka was the first to specifically protect wildlife by law, back in the 3rd century BC. Several Muslim and Hindu rulers created hunting reserves for their own use [Stracey 1963]; many of these were later to become independent India's national parks or sanctuaries. During the British colonial period, the Indian forest service was set up (1865) and an elaborate system of reserved and protected forests was established (1878) [Tucker 1988, Tucker and Richards 1983], partly for conservation purposes, and partly to reserve areas for commercial forestry. The country's first specific wildlife protection law, the Madras Wild Elephant Preservation Act, was passed in 1873 [Stracey 1963].

Agencies outside the government were also at this time becoming vocal about conservation, amongst the first being the Nilgiri Game Association, founded in 1879, and the Bombay Natural History Society (BNHS) set up in 1883. These and other provincial organisations were instrumental in the promulgation of the Wild Birds and Animals Protection Act of 1887, a precursor to the current WLPA [Stracey 1963], along with groups like World Wildlife Fund (now World Wide Fund for Nature), they have continued to be highly influential in the development of wildlife programmes (such as Project Tiger) well up to recent times.

The increased availability of firearms after first world war led to a rise in hunting,

prompting renewed concern about the fate of several species simultaneously, the realisation that entire habitats were threatened led to the establishment of the National Parks Act in 1934, and the creation of India's first national park, Corbett (then Hailey National Park) [Tucker 1991]. Events related to second world war saw a greatly heightened attack on wildlife habitats, so that as soon as India gained independence there was considerable pressure from naturalists to take urgent conservation steps. India's first prime minister Jawaharlal Nehru himself a keen naturalist set up the Indian Board for Wildlife (IBWL) in 1952. The IBWL is today the main advisory body to the government on wildlife conservation.

But the most important step was to come only in 1972 when the WIPA was promulgated and extended to all the states of the country. A series of national programmes notably Project Tiger were also launched towards the protection of specific habitats and threatened species. State governments rapidly expanded their network of PAs under the WIPA.

This network of about 500 PAs has helped to conserve a significant part of India's biodiversity including a wide diversity of habitats and species. The factors causing biodiversity loss would have gobbled up these areas too if it were not for the protection given. Several examples come to mind: the Marine National Park in the gulf of Kutch fighting what is so far a successful battle against a proposed Reliance Industries refinery; Balukhand Sanctuary in Orissa standing in the way of a luxury hotel complex; Bhitarkanika Sanctuary also in Orissa, resisting attempts to build fishing jetties and introduce trawlers. In addition, the legal protection given to threatened species has also helped in their recovery: we have no doubt that in the absence of the WIPA, and of associated programmes the one horned rhinoceros *Rhinoceros unicornis*, the Asiatic lion *Panthera leo persica*, the swamp deer *Cervus duvauceli*, the brow-antlered deer *Cervus eldi*, and dozens of other species would have joined the Cheetah on the list of extinct animals.

PROTECTING WILDLIFE FROM PEOPLE?

But that is only one side of the story. Contrary to the conventional middleclass image of PAs as pristine habitats untouched by human hands, the majority of India's PAs have human communities dependent on their resources for sustenance and livelihood. A national survey done in the late 1980s (hereafter referred to as the 'IIPA PAs study') revealed that 69 per cent of surveyed PAs

had human population living inside, and 64 per cent had community rights leases or concessions inside them [Kothari et al 1989]. The most common activity inside was grazing present in 69 per cent of the surveyed PAs while 57 per cent had collection of non-timber forest produce. A rough extrapolation of available data from the same survey reveals that there are at least three million people living inside PAs.

The declaration of PAs and the imposition of regulations under the WIPA was almost always done without consultation with these communities and resulted in their rights being terminated or abridged, or access to basic resources being cut off without adequate provision of alternatives. An analysis of the genesis and history of the official conservation effort in India reveals several influences which led to such neglect (though we are not of the opinion expressed by some activists and academics, that official conservation measures were another *deliberate* attempt by the rich to dispossess the poor): (i) One of the primary motivations for the creation of PAs in the princely states and for the promulgation of certain regulations in the British period was a concern about the depleting populations of 'useful' animals: those which were favourite hunting targets or those which could be put to productive use (e.g., elephants used extensively by the British in forestry operations). PAs like Ranganthittu set up solely to protect birds for their own sake rather than for hunting [Lal et al 1994] were exceptions. But whether it was concern regarding depletion of 'game' or ethical motivations, this concern did not extend to the dependence of the local communities on these species or their habitat. Indeed rulers very often held such communities responsible for species decline and so kept them out as far as possible. As stated above, many of the royal hunting reserves were the ones later converted to national parks and sanctuaries complete with the legacy of shutting them off to local people. (ii) The main actors in the official conservation process during the British period were princes, British officials or naturalists, their Indian collaborators or counterparts big game hunters, and/or other members of the Indian or colonial elite [Tucker 1991]. Most of these individuals were alienated from the vast majority of Indians, and especially ignorant, if not disdainful, of village society. While some of them recognised the ecological knowledge and related practices of local communities (and indeed, as hunters or naturalists, used this knowledge), the majority of them were dismissive of traditional systems. Indigenous

practices of forest management, hunting and trapping and conservation were marginalised indeed, in their bid to establish physical and moral control the British tried to delegitimise tribal or non-tribal peasant practices as being reckless and destructive [Rangarajan forthcoming].

In actuality most such practices were far from reckless (except when combined with externally imposed inputs like modern firearms). These beliefs and knowledge/practice systems were unfortunately bypassed in official conservation efforts and local communities were never considered critical elements in conservation planning.

It is doubtful that the change from British to Indian bureaucracy managing forests and wildlife brought in much greater sensitivity to local community interests. It may be instructive to do an analysis of the composition of the Indian board for wildlife since its inception up to the present stage. We have no doubt that it would overwhelmingly consist of the ruling elites, and that there would be virtually no representative of local communities. The assumption was that wildlife conservation and habitat management were the prerogative of naturalists, formal ecologists and foresters, and that modern biological science was all that was needed for the task. This is probably still the case even though it has become abundantly clear that socio-political factors are equally critical inputs in habitat conservation and management and that traditional knowledge can play as vital a role as modern science. (iii) A considerable part of the influence of Indian wildlife policy and programmes came from the west: this included not just the British present in India, but also interaction with western conservationists at forums such as the series of conferences held in the early part of this century [Stracey 1963, Tucker 1991]. The model which in the late 19th century and early 20th century was being applied in the colonial tracts of Africa was also imported to India: the essential feature of this was the closure of natural habitats to human populations. There was very little attempt to assess the suitability of such a model to Indian ecological or social conditions. As an example, the concept of national parks originated in the US (which set up Yellowstone in 1872) a large area where 'one or several ecosystems are not materially altered by human exploitation and occupation' and where the 'highest competent authority of the country has taken steps to prevent or eliminate as soon as possible exploitation or occupation in the whole area' [West 1991]. In India, this

concept was in many cases applied to areas with resident populations the IIPAPA study showed that 18 (56 per cent) of 32 national parks surveyed had people living inside them [Kothari et al 1989]

PLANNING AS SOURCE OF CONFLICT

A considerable number of individuals who have influenced conservation policy since the latter part of the 19th century have been naturalists and biologists of exceptional merit. The British period threw up many dedicated persons, both foreign and Indian, who added substantially to the formal knowledge of India's wildlife and natural habitats, a trend which continued after independence. Unfortunately, however, even from a purely scientific point of view, the actual creation of national parks and sanctuaries in India has often been highly irrational, at times ignoring even available expertise. This in turn has added to the situation of conflict in these areas.

Planning a PA network involves an assessment of areas and species which are critical for conservation, the major natural and human factors influencing or threatening them, and the conservation strategies and institutions needed.

Conservation planning in India has been deficient in all these respects. Informally and sporadically, an assessment of areas and species which need conservation measures has been made by conservationists or state government officials, but no comprehensive national survey on this existed till the late 1980s. Recently the Wildlife Institute of India conducted a pathbreaking study in identifying ecologically representative habitats which needed PA status [Rodgers and Panwar 1988], but it was unable to look at the human factor in these areas. The IIPAPA study was conducted in the mid 1980s [Kothari et al 1989] but was largely based on governmental data, which can often be notoriously inaccurate. In any case, even this study has remained largely ignored in actual PA network planning, as parks and sanctuaries continue to be set up and managed in an arbitrary manner.

Examples of irrationality in planning and of how this results in avoidable conflicts are plentiful. As mentioned above, many PAs in the country contain human populations inside them, in many cases there is little possibility of shifting these people out, even if this was socially acceptable, given the intense land pressures in surrounding areas and the lack of governmental resources. A number of these areas also have limited ecological value, with highly degraded ecosystems. The Bannerghatta National Park in Karnataka is an example. The Nargu Wildlife

Sanctuary in Himachal Pradesh has 170 villages concentrated on the western side [Singh et al 1990]. This side has little forest left, however, the eastern, more hilly side has wildlife value and adjoins forests which, for some administrative reason, have not been included in the sanctuary. The daily conflicts which come up on the western side could easily have been avoided if the sanctuary boundaries had been based more on ecological grounds than on administrative considerations.

Other conflicts are created because of irrational assignment of a particular PA category to an area. Under the WLPA, two categories of PAs are possible: national parks and sanctuaries. The former is by law more strictly protected, allowing virtually no human activity except that which can be defined to be in the interests of wildlife. In sanctuaries, there is scope for traditional resource collection, had land-based production activities to continue, though this is left to the discretion of the wildlife and civic authorities. There are several examples of areas having been declared national parks with human populations inside, only to be followed by the park authorities tying themselves up into legal knots when they find that they cannot evict these populations. As an example, there is currently a controversy raging about Nagarhole National Park in Karnataka. This park has 54 tribal settlements with a population of about 6,000 [Ial et al 1994], and for a long time now the forest department has been in two minds about whether to resettle them (as dictated by the WLPA). The tribals are naturally resisting displacement, stressing that they have a right to the area, and that they can in fact be central actors in its conservation. Again, the conflict could have been minimised if the inhabited part of Nagarhole had been declared a sanctuary or some other conservation category selected in consultation with the resident tribals. Suggestions to convert it to a sanctuary now are being resisted by the forest department and some conservationists, as it would appear to lower the legal status, though in the case of the Great Himalayan National Park, such a change has been accepted (V Sankaran, Indian Institute of Public Administration, personal communication).

Another well known example illustrates that decisions about PA status are often taken not only ignoring human factors, but are also often scientifically unsound. The Keoladeo National Park, better known all over the world as Bharatpur bird reserve, is a small wetland harbouring over 350 species of birds. It is partly artificial, filling up with

the waters released from a nearby irrigation project. In 1980, its status as a sanctuary was upgraded to that of a national park, and almost immediately after, grazing was banned. In one of the worst incidents of conflict which followed, seven villagers were killed protesting against this ban [Prasad and Dhawan 1982]. Ironically, a long-term study by the Bombay Natural History Society showed that buffalo grazing was an integral part of the ecosystem, helping to counter the tendency of the wetland to turn into a grassland [Vijayan 1991]. Its ban had adversely affected the wetland. In desperation, the Park authorities have now had to allow grass-cutting by the villagers.

The decision to ban grazing was taken because it was assumed that grazing must be damaging the ecosystem, and because the WLPA does not allow grazing inside national parks. Similar assumptions are also made regarding other traditional resource uses, even though there is evidence from the Amazon rainforest and the African savannah [Colchester 1994]. Himalayan pastures [Hans Raj Negi, Indian Institute of Science and Saberwal, forthcoming] and India's western ghats (Utkarsh Ghate, Indian Institute of Science) that diversity may not be reduced by many such uses, and may in fact be locally enhanced (though such results are not generalisable to all uses and all ecosystems). Ironically, some conservationists who hold all local community activities to be inimical to PA conservation, nevertheless are willing to allow eco-tourism into the same PAs [Singh 1994].

A convoluted process in which the legal status, rather than the conservation priorities and levels of human dependence, determines what human activity can and cannot be allowed, has created conflict in many areas. Thus, in the core zone of Manas Tiger Reserve, the forest department burns thatch grass as a management measure, but does not allow local people to harvest it in a regulated manner for construction and fodder, as that is not considered permissible in a national park [Gadgil and Joshi 1994].

Decisions to restrict or stop certain human activities have often been taken arbitrarily, without any proper assessment of their impact on the ecosystem or its wildlife, and without any clear statement of the conservation objective sought to be achieved. Undoubtedly, most of these decisions are taken with the best of intentions. Undoubtedly, also, in many cases they are justified, for, as mentioned below, human pressures in several areas do cause serious damage. However, even in such cases, the high-handed manner in which restrictions

are imposed, and the almost universal absence of suitable alternatives being provided has led to avoidable suffering and tension

PARKS AND PEOPLE: TWO-WAY CONFLICT

Protected areas have had the following major impacts on people

(i) Forced displacement from national parks, core zones of sanctuaries or special conservation areas like Tiger Reserves. Contrary to popular perception, the establishment of the Yellowstone National Park in US, the forerunner to most such PAs in the world, also involved the forcible displacement of Shoshone tribals [Kemp 1993]. For India too, this is not an entirely new phenomenon: the Maharaja of Kashmir, for instance, removed all human settlements from the Dachigam deer reserve (now national park) back in 1910 [Tucker 1991]. Some commentators suggest that upwards of 600,000 people have been displaced from Indian PAs [Fernandes et al 1989]. We feel that this may be an exaggeration as it is based on the assumption that most people living inside national parks and core zones of sanctuaries have been evicted. However, fortunately, actual eviction has not taken place as extensively as would have been the case if the WLPA had been strictly enforced. An assessment of 104 human inhabited PAs as part of the IIPA PAs study revealed that eviction had taken place in only seven and was proposed for another 13, and that the number of people involved was a few thousand [Kothari et al 1989]. However, whatever independent assessments have been done of these relocations all conclude that they have been rather poorly carried out [Fernandes et al 1989, Jena 1993], though officials involved in some of them (e.g. Kanha National Park in Madhya Pradesh) claim a high degree of success (H. S. Panwar, Wildlife Institute of India). This is of course part of the general failure to properly rehabilitate displaced people [Kothari S 1995].

(ii) The more common impact has been the curtailment or extinguishing of local community land and forest rights, or access to natural resources inside PAs. This has had a direct impact on their survival and livelihood base, for even basic inputs like cooking energy and fodder for livestock have become hard to obtain. Traditional activities have suddenly become 'illegal' (the 'criminalisation of tradition' as reported from several countries) [Peluso 1992], and villagers report considerable harassment and bribe-taking by forest staff. To add insult to injury, villagers have rarely been explained the

reasons for this curtailment of rights, and viable alternatives have rarely been provided [Chaudhuri 1993]. During the recent Jungle Jivan Bachao Yatra through 18 PAs of western and central India, participants found such incidences from every area. Recent amendments (1991) to the WLPA have further curtailed local community activities by prohibiting all activities causing damage to the habitat of a sanctuary (a provision already in place for national parks). One immediate effect of which was that some state governments severely restricted or banned collection of non-timber forest produce from within PAs. The 1991 amendment also made easier the final notification of parks and sanctuaries which were declared on Reserve Forest (RF) land on the assumption that local rights would have been dealt with when the RF was declared. This is a faulty assumption (admittedly held and advocated by one of us till a few years back), since many rights were never adequately dealt with, especially during the colonial times.

(iii) The protection offered by PAs and the WLPA has resulted in an increase in the population of some species (elephants, wild boar, nilgai, tigers, lions, leopards, bears) in some areas. This results in a spill-over of animals unable to find adequate food and territory, or of those who actually prefer human-made habitats like fields. The result: direct human-animal encounters leading to human injury and death, livestock lifting, crop-raiding and property destruction. For example, about 63 (30 per cent) of 206 PAs sampled in the IIPA PAs study reported incidents of human injury or death [Kothari et al 1989]. Crop damage by species like wild boar and nilgai is so widespread that some states have declared them vermin or ordered their elimination from areas of high damage.

In this situation, a feeling of hostility amongst local communities has quite naturally built up. In an increasing number of areas this has manifested itself in the form of physical clashes between villagers and wildlife staff or other state forces, physical damage to habitats by irate villagers, poaching or support to outside poachers, and even demands for denotification. The discontent is often voiced in the most destructive of ways, e.g., the widespread incidences of fire in several protected areas [Basappa Navar 1993], police firing upon villagers as in the Bharatpur case cited above, attacks on forest staff by angry villagers as in the case of the former field director of Ranthambhor Tiger Reserve who was nearly beaten to death. A survey of 222 PAs as part of the IIPA PAs

study revealed as many as 47 which had had physical clashes between people (local or outsiders) and forest officials. Jalapara Sanctuary in West Bengal reported 20 confrontations for the period 1979-84 while Gir National Park in Gujarat home to the world's last population of the Asiatic lion, reported 12 [Kothari et al 1989].

This conflict is one of the most serious threats faced by our protected areas and the biological and cultural diversity they contain. A protection strategy which alienates local communities is unjust to them and disrespectful of their fundamental rights, as also short-sighted for wildlife conservation. What is happening in Narayan Sarovar and Shoolpaneshwar people demanding denotification could well happen in many other Indian PAs if conservation policies remain insensitive and unjust. No amount of state control will save these habitats against such unrest. Again, this mirrors similar occurrences in other countries [Neumann 1992].

The park-people relationship is, of course, by no means one-sided. Increasingly, local communities are putting excessive pressure on natural habitats or becoming conduits to serve urban and commercial demands. The mass ritual hunting carried out by some communities and the indiscriminate hunting of mammals and birds by some north-eastern tribes are causing irreversible decline in wildlife species. Even tribal groups like the Naga Students' Association and the Naga Mothers' Association had to recently issue an appeal to stop hunting in the state of Nagaland [Anon 1991] of special concern was the rapid decline of species like hornbills, whose casques are used as traditional headgear.

Ecologists have also pointed out that local resource use is no longer sustainable because their populations or that of their livestock has risen or because their demands have gone up in response to urban consumerist values. The irreversible degradation as a result is boomeranging on these communities themselves. The most striking example of this is shifting cultivation in north-eastern India. Once a sustainable and biologically diverse system of agriculture in areas which cannot sustain settled cultivation, shrinkage of the total available habitat and local population rise has cut down shifting cycles to obviously unsustainable levels [Ramakrishnan 1992, Sayre 1991, Deb Roy 1992]. Elders in the area also note that cultural changes have led the younger generation to ignore the careful tending of the land which characterised earlier cultivation practices. In addition, members of many tribes are

involved in selling off their forests to sawmills mushrooming all over the north-east [IYH and Kalpavriksh 1992]. The net result of these changes (and of state and central policies, army interventions, and other factors), is widespread degradation of forest and land resources [FSI 1987, 1989]. Local community rights in such a situation are often a dangerous facade for the power of a few members of the communities to get rich, fast.

Wildlife habitats also face considerable encroachment, in a sense a continuation of the state-sponsored expansion of agriculture into prime forest areas after India gained independence. Out of 204 PAs studied in the IIPA PAs study, about 35 reported encroachments [Kothari et al 1989]. This is a difficult issue to resolve. On the one hand, a lot of the encroachment is by poor people who have no alternative (since state governments have generally been unable to carry out land reforms and redistribute land to them, or provide alternative employment opportunities). On the other hand, commercial interests also encroach using poor people as fronts. More often than not, state governments have 'regularised' these encroachments, hoping to increase their vote banks or other 'earnings'. The Forest Conservation Act of 1980, which attempted to discourage such regularisation, has been repeatedly violated by both state and union governments.

URBAN-INDUSTRIAL PRESSURES: COMMON ADVERSARY

Even while wildlife conservationists and community rights advocates argue with each other, one of the major forces of destruction makes merry. This is the urban-industrial economy, a sector which has no qualms in destroying biological or cultural diversity for short-term commercial gains. There are examples by the dozen in India, of mining, commercial fishing and forestry, dam construction, government office construction, road-building, high-price tourism, and a variety of other commercial activities inside several national parks and sanctuaries. Many of these have come up after establishment of the PA. In the biodiversity rich western ghats in Karnataka, parts of the Kudremukh National Park have been leased for minerals prospecting in the early 1990s; the Madhya Pradesh state government has offered free landholdings to the tourism industry for setting up facilities inside Pench, Kanha, and Bandhavgarh national parks, and Pachmarhi sanctuary.

The extent to which state governments are willing to compromise to please the urban-

industrial lobby is illustrated by the spate of denotifications carried out or proposed. Under the WLPA, any state government can take a PA off the record books, thereby removing its legal protection, by taking the permission of the state legislature. Obtaining such permission is usually not difficult, given that politicians are more concerned about votes (however illusory) than about wildlife. In 1991, Darlaghat sanctuary in Himachal Pradesh was denotified to make way for a cement factory. In 1992, a substantial part of Melghat Tiger Reserve in Maharashtra was denotified; officials claim this was to help local tribals be free of the sanctuary's restrictions, but some conservationists fear that there may be plans to open up the area for commercial operations [Sahgal 1993, Aziz 1994]. The Gujarat government denotified Narayan Sarovar for cement production (without even obtaining legislative approval), and threatened to denotify a part of the Marine National Park in the Gulf of Kutch to make way for an oil refinery. In Orissa, the government proposes to denotify a part of the coastal area Bhitarkanika sanctuary. It claims that this is to enable the local small-scale fisherfolk to better sell their catch, but local activists claim it is to enable commercial trawling interests to operate off the coast [Misra 1994; Banka Behary Das, former MP]. The same state government wants to take Balukhand sanctuary off the books to allow a hotel complex to come up.

The extent to which governments themselves are to blame for the situation is also evident from the continued occupation of various official departments on PA land. The IIPA PAs study found that 144 out of 233 PAs had such occupation; most common were roads, tourism facilities, and transmission lines [Kothari et al 1989]. This is despite the WLPA's clear stipulation that all PA land should be under the control of the state wildlife authorities.

What is often ignored is that the root of many people-park conflicts lies in these urban-industrial pressures. A classic case is that of Rajaji National Park in the Himalayan foothills of Uttar Pradesh, the centre of a bitter conflict over the forest department's moves to evict nomadic pastoralists called Gujjars. While the department and many conservationists have focused on the alleged overgrazing by the Gujjar livestock, and local activists have pointed fingers at the corruption rampant in the forest department, the truth is that the Park's forests, wildlife (including elephants), and human inhabitants have been victim to the fragmentation of habitat caused by the expansion of the cities

of Dehradun, Haridwar, and Rishikesh [Poti 1995]. Specifically, traditional elephant migration routes have been cut off by industries, power channels, and army camps, increasing animal-human conflicts in the area where the pachyderms are now trapped. The Gujjars have become an easy scapegoat for the government, which is unable to tackle the vested interests behind the urban-industrial expansion around the Park.

Similar is the case of people displaced by dams or other 'development' projects, and not given proper rehabilitation. PAs like Koyna sanctuary in Maharashtra and the Dudhwa National Park in Uttar Pradesh are subject to encroachment and pressures from such oustees. In Pench National Park, Madhya Pradesh, labourers brought in to work on a dam in the area, were abandoned by the irrigation department after two decades of construction. With no-one claiming responsibility for them, the threat of eviction by the forest department hangs on their heads.

Vested interests also often use people-park conflicts as fronts to pursue their own agenda. Politicians are habitual exploiters of such situations, especially if they can see a potential vote bank in the aggrieved local communities. In the Sanjay Gandhi (Borivali) National Park outside Bombay, land developers regularly get poor people to encroach, project the issue as one of the rights of slumdweller, and eventually take over the land themselves.

Commercial pressures on India's PAs are only going to increase manifold with the new liberalisation and structural adjustment policies of the government [Kothari, A 1994c; Kothari, A 1995]. Exports of natural resources and related products, like fisheries, are a major thrust of these new policies. Already coastal and marine PAs are facing threats from prawn and shrimp farming, and trawling; many inland PAs which are sitting on rich mineral deposits are being eyed by Indian and foreign companies; several state governments have announced major concessions for industries coming up in so-called 'backward areas', which are inevitably also the areas with the last vestiges of natural habitats and traditional communities.

FOREST DEPARTMENT: BACKS AGAINST THE WALL

While activists have been justifiably critical of the forest department for its high-handed handling of the wildlife conservation programme in India, a criticism with which we would concur, we would also point to the often heroic efforts of forest officials in

saving threatened habitats and species. The odds are particularly heavily stacked against the 'lower' rungs of the department. For foresters, forest guards, and daily wage workers, conditions on the ground are usually daunting. Apart from the physical rigours of working in natural habitats, there is minimal access to the even basic facilities like transport equipment, education and housing, the salaries are low, and encounters with poachers and timber thieves who are usually better armed are frequent. News about forest staff being killed by the timber and poaching mafia are commonplace. There is frequent harassment due to false charges levelled against them, very often they are up against politicians or even people from other government departments including the police. Forest officials are often transferred when they stand up to illegal activities carried out by influential vested interests. We would even argue that the widespread occurrence of corruption amongst forest staff is often (though by no means always) an outcome of these adverse conditions. A forest guard who can be beaten up or shot dead if he opposes illegal activities is more likely to take a bribe and look the other way than risk his life.

In addition, the department has to work within the structure and directions set by the government. Since, even five decades after independence, forest and wildlife conservation remains a low priority in state planning, the department continues to have very little power compared to other government agencies handling development or commerce-related activities.

In such an environment, the efforts of individual officers in opposing commercial interests is commendable. The case of Radhanagar Sanctuary, Maharashtra cited above where bauxite mining would have started long back were it not for the efforts of the local forest officer, is instructive. A range officer in the Okhla Bird Sanctuary near New Delhi exposed illegal granting of fishing contracts by the Delhi government, resisting offers of bribes and threats to life. With the help of local NGO support, he got the contracts cancelled. Just outside Corbett National Park, the field director caught a state minister illegally fishing, and fined him Rs 25,000 on the spot, risking possible transfer and harassment. Forest officers in charge of Bhitarkanika Sanctuary in Orissa have consistently opposed their own state government's proposal for construction of jetties there, one of them getting transferred as a result.

These are exceptional, but not isolated, examples of people fighting against the

destruction of wildlife habitats from within a system which does little to encourage such boldness. Activists who paint the entire forest department corrupt or evil (Anon 1995) do them grave injustice, and make even more difficult the task of bringing together all those interested in conservation and livelihood security.

IS ECO-DEVELOPMENT THE ANSWER?

The increasing conflict in and around PAs has forced the government to respond more substantially in the last decade or so. From improvement in relocation strategies to the provision of alternatives and jobs, a range of options is being tried out. Part of the cue for this comes from international sources. For instance, the World Conservation Strategy (IUCN/UNEP/WWF 1980) emphasised the importance of alleviating rural poverty as an important consideration in conservation planning. From this emerged the concept of 'eco-development'.

In 1982, the government of India set up a task force to recommend measures to gain public support for conservation. Its report submitted in 1983 strongly urged a strategy of zonation in which the PA consisted of a strictly protected core and a buffer with very limited human activities, surrounded by a multiple use area where the majority of human use would be diverted (IBWL 1983). In these multiple use surrounds, it was recommended that eco-development measures be promoted. The assumption was that while a productive wilderness has an enormous direct and indirect advantage to them (the rural poor), it is the abuse and overuse by them that is responsible for its degradation. The primary objective of eco-development was seen to be the diversion of pressures that local communities were putting on the proposed PA, and with the help of appropriate livelihood generation schemes to win the support of these communities in the protection of wildlife. In the words of the task force, "co-operation (of local communities) is forthcoming if rigid enforcement of protection is backed by reasonable alternatives".

Eco-development projects are slated to rise substantially as interest in them has risen not just within the Indian government but also amongst several external aid agencies, notably the World Bank. India is currently negotiating a large grant (30 to 60 million dollars) with the Global Environment Facility for eco-development around eight selected PAs to start with. Another 40 PAs may be targeted soon thereafter (Kishore Rao, Ministry of Environment and Forests).

Some of the recent eco-development

proposals show a substantially greater awareness of the 'fundamental causes of the people park conflict' (IIPA 1994a, Singh 1995) but appear unwilling to tackle these causes. Thus, for instance, Singh (1995) rightly points to landholding and other inequalities around PAs as being one of the root causes of pressure by poor people on the park, yet his own prescription for eco-development around the Great Himalayan National Park (Himachal Pradesh) contains no stress on land reforms or addressing other resource inequities. The indicative eco-development plans for the eight selected PAs under the GEF project (IIPA 1994a) have virtually no proposal to revive community rights over land/water/forest resources or to reduce exclusive government control over these resources, or to redistribute such controls within stratified communities (except for suggestions like using some excess land of religious institutions to grow biomass for local people). This indicates the prevalence of the same 'charity' approach which characterises official rural development programmes, even though there has been greater consultation with local communities than is the case with these programmes.

Many other shortcomings exist. Most eco-development plans continue to be targeted at people living outside PAs. While independent consulting agencies like the Indian Institute of Public Administration have not advocated displacement of people living inside, they have also not stressed the need for eco-development planning for such people where they are currently residing. This leaves room for the forest department to continue to seek displacement. Secondly, though there is some mention of involving people in PA management (IIPA 1994a), none of the plans discuss how this is to be done. Possibilities of bringing this in during the micro-planning stage of eco-development are remote, as state governments remain unconvinced about the desirability of such involvement. Third, while local traditional knowledge gets passing mention here and there, placing it centrally within the planning process of a PA is nowhere on the agenda. Fourth, the legitimacy of a PA's legal status is rarely questioned, leading to statements like 'all habitation within the PA is now illegal as is all grazing and other human uses or extraction' (for Gir and Nagarhole National Parks) (IIPA 1994a). Given that many of these uses are age-old, and certainly pre-date the creation of the national park, this is a rather insensitive attitude to take.

BIOSPHERE RESERVES: A NON-STARTER?

In an attempt to widen the scope of conservation strategies, UNESCO proposed the creation of Biosphere Reserves (BRs) in the early 1970s. These reserves were set up with the basic objective of conserving and developing a knowledge base about the biodiversity of a region, with the emphasis that humans were an integral part of the ecosystem and that local communities should be involved actively in conservation programmes [Batisse 1993]. This emphasis distinguishes it from national parks and sanctuaries, and provides grounds for a reconciliation of conventional wildlife-human conflicts.

India has established seven BRs since 1979 (though none of them is officially registered with UNESCO). Nokrek (Meghalaya), Nilgiri (Tamil Nadu, Karnataka, and Kerala), Nanda Devi (Uttar Pradesh), Great Nicobar (Andaman and Nicobar Islands), Gulf of Mannar (Tamil Nadu), Manas (Assam), and Sunderbans (West Bengal). These cover about 21,067 sq km of area [Gadgil and Joshi 1994]. Another seven are proposed; together, these 14 will be representative of the 12 major biogeographic zones of India.

However, actual management of these reserves continues to be based on the conventional PA approach, with the forest department designated to be in charge. This mirrors the first decade of BRs worldwide, where countries gave much more emphasis on biodiversity protection and research than on the integration of human uses within the habitat [Batisse 1993]. Scientists of the Indian Institute of Science, in a survey of the seven Indian BRs, note that there is virtually no attempt to reconcile development activities with conservation, to harness the knowledge of local communities, to involve such communities in management, or in other ways to achieve the objectives originally set for BRs by UNESCO [Gadgil and Joshi 1994]. In the case of the Nilgiri BR, declared in 1986, serious lack of co-ordination between the three states involved, between the forest department and other government agencies, and between government and local communities, continues to hamper the fulfilment of objectives. For instance, the plan for the reserve had suggested restoration of a corridor through the Gudalur area; this was not heeded, with the consequence that over the last decade this corridor has been destroyed by private encroachments and the activities of the Tamil Nadu Tea Corporation [Gadgil and Joshi 1994].

Clearly, the response to the people-park conflict will have to go beyond the eco-development approach, into one which places the local communities and their cultures squarely in the centre of the planning process [Kothari and Parajuli 1994]. If properly implemented, BRs could be effective in some areas, especially where extensive areas need conservation. But it is also clear that no one solution is likely to be relevant for the whole country. In many areas local communities have shown that they can on their own protect wildlife habitats, though typically these are small in scale, such as the sacred groves scattered through much of India, or the 'Sonchuri' established by villagers in Rajasthan. Many other areas, large-scale and remote from human habitation, are probably best managed by government with some independent NGO and research support. But increasingly, we feel that neither local communities nor government agencies on their own will be able to conserve PAs and wildlife. Communities lack the resources to tackle threats or ecological issues at a regional scale, and in many places have lost their traditional ethos and institutions; government agencies lack the necessary micro-knowledge, on-the-spot manpower, or even often the necessary mandate when other agencies over-rule them. With rare exceptions, neither local community nor the forest department on its own is able to face the onslaught of commercial forces, or able to check the destruction caused by some of their own members. There is therefore a need to explore partnerships in conservation, which will involve local communities and government agencies as core, equal participants, with critical support from NGOs and independent researchers.

The need for such a partnership is now felt all over the tropics, where so far a top-down approach has been practised. The Caracas Declaration, made by 1,500 delegates from around the world at the fourth world congress on National Parks and Protected Areas in Venezuela, February 1992, urged all governments and appropriate national and international bodies:

To support the development of national protected area policies which are sensitive to customs and traditions, safeguard the interests of indigenous people, take full account of the roles and interests of both men and women, and respect the interests of children of this and future generations; .

To develop mechanisms that will allow all sectors of society, especially long-standing local populations, to be partners in the planning, establishment, and management of protected areas, and will

ensure they share equitably in the associated costs and benefits;... [IUCN 1993a]

The recently signed convention on biological diversity also commits countries to such action [Kothari 1994b]. In the section on *In-situ* conservation, dealing with protected areas, it states that each signatory country will,

subject to its national legislation, respect, preserve and maintain knowledge, innovations and practices of indigenous and local communities embodying traditional lifestyles relevant for the conservation and sustainable use of biological diversity and promote their wider application with the approval and involvement of the holders of such knowledge, innovations and practices and encourage the equitable sharing of the benefits arising from the utilisation of such knowledge, innovations and practices.

In several countries of South America and Africa, participatory management is being successfully tried out [West and Brechin 1991, Kemp 1993, Colchester 1994, IUCN 1995]. One of the most-cited cases is the 'Campfire' project in Zimbabwe, where communities help in managing large rangelands. In Honduras, cultural preservation areas along with biological reserves are being created so that tribal people are able to maintain their traditional ways of life. In Australia, the Kakadu National Park was established on aboriginal land in co-operation with the tribal council. The discovery of uranium in the area has led to severe conflicts, in which the park has been an important institutional buffer helping to protect aboriginal rights. Other examples of convergence between protected areas establishment and cultural preservation can be found throughout the world: the Kuna Indians in Kuna Yala Biosphere Reserve in Panama; tribal peoples in the Xingu National Park in Brazil and the Eskimos and the Kobuk Valley national Monument in Alaska. In Uganda, the National Parks authority has entered into 'collaborative management' agreements with local tribals, and is considering extending it to all parks. Though a broad worldwide survey of these efforts by Colchester (1994) found several shortcomings, he notes that there was a "continuing need to define a role for the state in securing indigenous territories as conservation areas".

JOINT MANAGEMENT: A NEW DIRECTION

Following up a series of workshops on the issue of people-park conflicts held in India over the last two years [RLEK and PRIA 1993; IPT 1993; LBSNAA 1993], the Indian

Institute of Public Administration (IIPA) organised an exploratory workshop on joint management of PAs in September 1994. After a detailed discussion on the various issues involved, participants, who ranged from local community activists to forest department heads, agreed to further explore the idea on the ground. One of us (AK) had then proposed a tentative definition:

Joint Protected Area Management (JPAM) is the conceptualisation, planning, and management of protected areas and their surrounds, with the objective of conserving natural ecosystems and their wildlife, while ensuring the livelihood security of local traditional communities, through mechanisms which ensure a partnership between these communities, government agencies, and other concerned parties.

This definition, of course, hides a whole series of complications which need resolution at the level of each PA: What are the conservation objectives of the PA? What are the existing livelihood sources, resource rights, and needs of local communities, and their impact on the PA? What are the methods and institutional structures by which joint planning and management can be evolved? What would be the precise sharing of powers and responsibilities between each partner? What were the ways of providing a stake in the PA to local communities?

Critical to the success of any PA management is a clear statement of conservation objectives. Since these would differ from place to place, and since there is a great diversity of conditions, the two categories of PA currently provided for by the WLPA (national parks and sanctuaries) are too limited to cover the very wide range of conditions existing in India: they do not adequately cover the concerns and interests of local traditional communities living inside natural habitat areas, nor do they cover a large number of other kinds of areas protected by government or people (e.g. BRs, sacred groves, wetlands, and tribal reserves).

There is a need, therefore, to explore an expansion of the concept of PAs, and perhaps to add a wider range of categories which could cover the range of human-wildlife interactions; in particular, to explore the potential of biosphere reserves and people-protected areas to reduce the people-wildlife conflicts. The categorisation of PAs developed by the World Conservation Union (IUCN) could be a useful indicator, though there may further be a need for indigenously developed categories.

Even within a single PA, varying management categories may be desirable. The commonly accepted opinion is that

protected areas could contain both no-use and limited or restricted-use areas, and that this could be achieved through appropriate zonation in which a single core or multiple core zones are surrounded by buffer zones where human activity is allowed. Such a concept has been part of PA strategy for long [IBWL 1983]. However, what is new in JPAM is that such zonation must be done in full consultation with local communities, and would take into account their own existing practices and beliefs (e.g. related to sacred groves). Such a process has been recently suggested, for instance, for Rajaji National Park [Pöti 1995].

An immediate task then would be to review the existing 500 PAs in India and assign new categories and zonation practices where necessary. For instance, if the area of Nargu Sanctuary of Himachal Pradesh which has 170 villages, is to be given a PA status because of some wildlife value, it could be a multiple-use PA category. In another case concerning the Great Himalayan National Park of Himachal Pradesh, two villages in the Sainj area were to be relocated as per rules of the national park. On the recommendation of researchers [IIPA 1993], the inhabited part of the park has been converted into a sanctuary, so that the villages do not have to be moved out.

One of the most important steps that JPAM would need to take is to revive in local communities a sense of control, or as some anthropologists say in the special context of tribals [Roy Burman 1993], a custodial association. This would mean a share in the management of PAs. There is a need to study the diversity of experiences on how either government or community control had worked towards conservation of natural habitats; further, what could be the respective sharing of ownership, powers, rights, responsibilities, and functions of each partner in a joint management system. We strongly feel that the forest department will have to give up its exclusive control over at least a part of the 23 per cent of India's land which it currently owns, in favour of the communities from whom this land was wrested in the first place. But since many communities, may for various reasons be unable or unwilling to conserve forests on their own, the transfer of power will have to go hand-in-hand with a mandatory responsibility for conservation. The non-fulfilment of this responsibility could lead to an abrogation of rights and control. The collaborative management contract for Uganda's Bwindi National Park, for instance, has built in such checks [MOU 1994]. Similar checks should, of course, apply to the forest

department (or other relevant government agency). Gadgil and Seshagiri Rao (1995) of the Indian Institute of Science have recently proposed a People's Nature, Health and Education Bill, which envisages the creation of natural resource management committees at various levels, and suggests a system of checks and balances to ensure conservation and sustainable use by all concerned parties.

Finally, JPAM would need to enhance the stake of local communities in the PA, by a variety of measures: guaranteed rights to sustainable extraction of biomass from specified zones, conversion of monoculture plantations into multi-species fodder/fuel stands, employment in PA related activities, a share in the decision-making about the revenue from tourism, returns for the use of traditional knowledge and skills on the basis of community intellectual rights, appropriate developmental inputs (including some of the activities being proposed in current eco-development plans), and the provision of alternatives where customary uses are clearly unsustainable. Of these, low-intensity extraction of non-timber forest produce and fodder could be the most widespread benefit from PAs in India; as mentioned above, about two-thirds of surveyed PAs in the mid-1980s already had such dependence. In many cases, the creation of co-operatives or other institutional structures, or the provision of appropriate technological inputs, can make such activities even more beneficial and sustainable. What is most attractive about non-timber forest produce (including, for instance, medicinal plants and honey) is that sustainable returns are possible only if habitat integrity and biodiversity are maintained, thereby becoming a powerful argument for habitat conservation. In the Biligiri Rangaswamy Temple Sanctuary of Karnataka, some NGOs are promoting medicinal plant conservation areas, where local tribals will be involved in protection, *ex situ* conservation and propagation, and medicinal uses of plants [FRLHT 1994]. In such situations, the peerless knowledge of local communities regarding their natural surrounds could be most effectively harnessed. Such approaches are being pioneered in a number of PAs across the tropics [Kemf 1993; West and Brechin 1991; Wild 1994; Colchester 1994].

In a larger context, national and international utilisation of traditional and innovative local knowledge for conservation or resource use purposes, can also be linked to returning benefits in various forms to local communities [Posey 1994; Kothari 1994a]. The debates on biodiversity benefit-sharing are increasingly focusing on the need for the

pharmaceutical and seed industry to give back some of its commercial profits to the habitats and traditional communities from where it has obtained a lot of its raw material, as also for society as a whole to repay its debt to these communities for conserving and maintaining habitat integrity over centuries.

Some conservationists fear that JPAM would mean an opening up of all PAs to human use and that no part of the country will be left inviolate' [Thapar and Manfredi 1995]. On the contrary we stress that a participatory exercise which examines all areas currently uninhabited and unused as also all areas that communities are willing to leave alone could yield much more than the 1 per cent land currently closed off and would mean much more effective protection. No additional area not already under traditional use must be opened up to human use. Rather even areas outside PAs which are currently not in use by local communities (but which may be under commercial use) should become inviolate PAs if considered valuable enough. It is of course critical that the total prohibition of human activity in such areas also extends to tourism for to do otherwise would be hypocritical.

We would even go so far as to argue that with the expansion of the concept of PAs suggested above and the addition of areas currently under corporate or government use a much greater proportion of India's territory could come under conservation-oriented management. There is no reason why the country cannot reach a PA coverage of 10 per cent as advocated by the world conservation strategy [IUCN/UNEP/WWF 1980].

CONSTRAINTS AND OPPORTUNITIES

The September 1994 workshop in New Delhi also identified the major hurdles and opportunities on the path towards JPAM. Perhaps the most critical stumbling block will be the intense distrust and mutual suspicion between the forest department and local communities. The only way to change this would be for the two parties to sit and talk in an open and equal way perhaps with the intervention of NGOs and concerned individuals. The Jungle Jivan Bachao Yatra was precisely one such effort of intervention. The Indian People's Tribunal on Environment and Human Rights (IPT) has initiated such an effort in the controversy-ridden Rajaji National Park in north India [Poti 1995]. In many areas the ice is being broken by forest officials or NGOs e.g. Kaila Devi Sanctuary.

Among the first steps needed to remove traditional distrust and hostility is to address

the adverse effects of PAs on local people. Payment of adequate compensation on time, for instance is a long overdue step. In Rajaji, the IPT report has suggested that a special officer be appointed for this and payment be ensured within 15 days of receipt of complaint [Poti 1995].

However even where there may be a willingness to consult and negotiate there are severe limitations to people's involvement imposed by existing wildlife laws. The WLPA allows very limited scope for local people's involvement in management and for deriving benefits from PAs. The 1991 amendment to the WLPA went a weak step towards obtaining public involvement, by stipulating the involvement of tribals in the State Wildlife Advisory Board, and granting citizens powers within the act to prosecute offenders. It also took an important step in opening up the possibility of villagers' rights continuing inside a sanctuary though not yet for national parks and though still subject to the discretion of the government.

Clearly there is a need to add further clauses to the WLPA, with mandatory involvement of local traditional communities in the planning and management of PAs and more flexible clauses regarding rights and activities which are to be carried out in each category of PA. There is also a need to relate the WLPA with the recent Panchayat Raj legislation in which considerable powers are being devolved to village representative bodies (though somewhat unsatisfactorily especially in the case of tribal areas), and to the proposed new bills on forest and natural resource management [MoEF nd].

Several existing efforts can become important pointers to the right direction. The widespread experiments with Joint Forest Management (JFM) are now being examined for their relevance to PAs [Rathore 1994, Raju 1994, Malhotra 1994], with the caveat that PAs are essentially conservation units whereas other forests currently under JFM are extraction units. Then, there are innumerable community efforts, such as ancient sacred groves all over India, village protected forests recently declared in some parts of Nagaland (Dhrupad Choudhary GB Pant Institute of Environment and Development) or Garhwal Himalaya [Kothari 1994d], the Bhairodev Dakav Sonchuri and others, the experiences of which would be valuable to learn from. The network of BRs could be oriented towards joint management, as has happened in many other countries. In the Sundarbans biosphere reserve, a start has been made by forming village forest protection committees under which local communities are empowered to protect areas

for their own use, and promised 25 per cent of the profits realised from any exploitation that may be taken up later [Gadgil and Joshi 1994]. At the September 1994 workshop at IIPA several tentative proposals for joint management of PAs were also discussed, which need following up [IIPA 1994b].

One major challenge facing JPAM is to define the local community itself, especially in situations of severe local stratification (caste, class, religion), or in cases of populations which have recently moved into an area. Giving benefits to the poor first is crucial but other sections cannot be ignored. There is also the question of how one defines traditional and whether 'traditional' rights can be terminated once community members opt for 'modern' lifestyles? If we as urban dwellers cannot have the right to extract resources from or live inside a PA perhaps the same yardstick could apply to members of the community who aspire to urban lifestyles? These are tricky issues, but even their long term resolution needs a fully consultative process rather than official diktat.

Another constraint is the lack of adequate or accurate information on ecological and social aspects related to PAs and a tendency among government and research organisations to keep information hidden from each other and from the public. There is therefore an urgent need for free flow of information between all people interested in PA conservation for greater ecological research and for respecting and using traditional knowledge of natural habitats and wildlife on par with modern knowledge.

Considerable sums of money are spent in and around PAs by various rural development agencies without any co-ordination with the wildlife authorities, and frequently in violation of conservation objectives. There is a need to harmonise the programmes and objectives of government agencies which have an impact on PAs and their surrounds [Pabla et al 1993, Thapar and Manfredi 1995]. Such co-ordination was achieved some years back for the Melghat Tiger Reserve in Maharashtra by a motivated district official [Pardesi 1994], and in the Harda areas of Madhya Pradesh by a forest official [Rathore 1994], models which could be used in other areas as well.

The most critical need is for an overall land-use policy which strictly limits industrial-urban growth. This calls for a drastic reorientation of the economic development policy which India currently follows. Neither the urban conservation class, nor the government bureaucrat, is capable of achieving this on their own. There is thus a need for the conservation effort to unite with the many mass movements which are challenging 'development' projects and

paths. Indeed, it is the people who lead such movements who have recognised that there is an artificial divide between conservation and human rights interests. For instance, the massive recent protests of India's traditional fisherfolk against the move of the Indian government to introduce trawling ventures, were prompted by concern both for the livelihood of these fisherfolk and the ecological health of the seas [Kocherry 1995]. In a significant development, conservation groups and movements in Bombay recently came out with a joint statement of protest against the denotification of PAs, signatories included members of the Narmada Bachao Andolan, the Kashtakari Sanghatana, the Bharat Jan Andolan and various other movements which are spearheading the fight against unjust and unsustainable development policies and which have conventionally not considered wildlife conservation important enough. Urban conservationists can no longer afford to shy away from such movements.

CONCLUSION: AN EXPLORATORY YATRA

In January-February 1995 about 35 villagers, activists and researchers went on a unique journey through 18 national parks and sanctuaries in western and central India. The Jungle Jivan Bachao Yatra (Save Forest Life Journey) was aimed at initiating a dialogue between various local communities living in and around national parks and sanctuaries, as also between these communities and the forest department. Stressing that India's fast-depleting wildlife habitats need urgent conservation measures, the Yatra intended to explore forms of conservation which ensured the participation and livelihood security of forest-dwelling people. It travelled from place to place holding meetings with villagers, forest officials and NGOs, and experiencing the various threats that PAs faced.

Though the Yatra encountered a large diversity of situations, some common themes stood out at all the PAs. It found a strong readiness amongst local communities to participate in conservation and natural resource management, but an equally strong feeling of alienation, as their traditional access to the forests has been curtailed by the imposition of the WLPA. In many places, the yatra found people pointing to the government's forests (or the sarkari tiger) and expressing their inability or unwillingness to help in their conservation if there is no reciprocal acceptance of their access to forest resources.

At the same time, the yatra found that forest officials are opening up to involving people in the conservation of these areas, some officers were categorical that they could not on their own save wildlife, especially from commercial pressures supported by other government agencies. The yatra concluded that conservation can only be achieved if there is strong and sustained co-

operation between local communities, forest officials, conservation and social action groups, and independent ecologists, based on clear conservation objectives, and a central role for local communities in the planning, protection, and monitoring of protected areas.

While local community response to the yatra was very positive, some urban observers were sceptical. Ironically, the yatra was subtly accused by some as playing up to rabid activist and political interests [Brijnath 1995] and by others as glorifying the forest department [Anon 1995].

Those who tread the path of joint or participatory management are likely to face the scorn of people who favour either of the two extremes: total governmental control or total community control. Regardless of these perils, and of the fact that partnerships are often fragile, JPAM deserves a trial in India with the following basic tenets: (i) The rights of both wildlife and local traditional communities are to be upheld; (ii) These rights are not necessarily antithetical to each other; indeed they are or could mostly be made harmonious; (iii) The relations between wildlife and local communities have largely soured due to factors outside both, especially market forces and government policies; (iv) Neither government agencies nor local people on their own will be able to counter the predominant threat to PAs from commercial forces; (v) There is therefore an urgent need to unite all forces interested in conservation including local communities and mass movements, NGOs, foresters, environmentalists, researchers, political parties and others. In the absence of such a unity, both wildlife habitats and local communities will continue to fall prey to the forces of destruction.

[We would like to thank Mahesh L. Rangarajan, Vasant Sabherwal, Neema Pathak and Smitu Kothari who critically reviewed an early draft of this article.]

Of Idealist Questions and Marxist Answers

U Vindhya

THE following comments do not aim to directly respond either to Balagopal's (BG) 'Democracy and the Fight against Communalism' (*EPW*, January 7, 1995) or to Arun Patnaik's (AP) rejoinder to BG's piece, 'Burden of Marx and Morals' (*EPW*, May 20, 1995). Rather, my purpose is to raise some questions in the light of BG's article and, more important, in the context of the furore the slightly different Telugu version of BG's article published in the September 1993 issue of *Aruna Tara*, the official organ of the Revolutionary Writers' Association, has created in the political and literary circles of Andhra Pradesh. AP makes an oblique reference to this stormy controversy when he speculates on the possible motive of BG's recent, what he thinks is anti-materialist, anti-Marxist *volte face* "the intemperate language of liberation" and the intolerance of one another shown by the various people's organisations in Andhra, be it peasant, women, or dalit which has pushed people like BG to retreat to the safer and quieter haven of pacifism. While I do not wish to comment on this clue to BG's 'turn around' I do want to mention a related aspect: the thrust of most of the rejoinders to BG's Telugu article that have appeared in *Aruna Tara* to date has been on BG, the man, whose 'sneaking liberalism' and traits of 'cowardice and weak will' in the face of severe state repression which had been ostensibly lying dormant till now have surfaced and propelled BG to denounce the official Marxism and stray into the foggy world of psychic, fraught as it is with "metaphysical pitfalls, abstract ahistoricism and perplexing paradox." Be that as it may, what is of concern here is that, given the political and cultural climate in Andhra, serious questions like the one raised by BG often tend to get hopelessly bogged down in the welter of calumny and personal slander, undermining the status and quality of the debate. Perhaps I would venture to say that the sharply critical and often virulent responses to BG's article stem from the wish to have one, complete, right statement of social reality, an overarching and compelling theory. The point, however, is whether all these responses enhance or sharpen our understanding of society and practice of democratic organisations.

BG in his *EPW* piece, while pleading for an expansion of democratic space of the Indian state in order to cut off the roots of the fascism of Hindutva, wonders "what it is in human beings that keeps ethnic, religious or communal violence alive as political passions" (p 59). Asserting that the Marxist

explanation has failed so far to account for this phenomenon, leave alone arrest it or prevent it, BG calls for a fresh look and proposes a dichotomy of the materialist and 'moral' spheres, hinting at a need for a deeper examination of this 'moral' sphere than has been attempted so far, at least in the Marxist tradition. Both AP and the Telugu discussants have taken umbrage at this proposed dichotomy saying that BG's formulations are a total departure from Marx's method.

However the point to be emphasised is that what BG is arguing for is nothing new. The notion that the work of Marxism is in some way incomplete has been present in most critical confrontations with orthodox Marxism. As Randhir Singh (1990) says, "Marx's scientific project leaves different areas of human activity, including politics, that are often loosely defined as 'non-economic' or 'non-material', relatively open, and undetermined in a manner as to be not entirely amenable to law-like generalisations, to scientific explanation as it is properly understood" (p 27). The need to recognise the importance of subjectivity or the non-material in directing or influencing the social behaviour of people has cropped up, over the years, in the classical individual-society questions and in the context of 20th century struggles of gender, caste, race and so on. Whether these subjective and material spheres are autonomous (as BG seems to believe) or the one is caused by the other (as AP says) is, I think, to take the debate to the one dating from Descartes to Locke and Kant and the entire rationalism-empiricism debate. While one can endlessly argue over the philosophical assumptions of this divide, it would be more fruitful, in my opinion, to examine whether the politics of subjectivity would be useful to further our understanding of what role the subjective 'moral sphere' vis a vis labour plays in constituting society, why there seems to be a rift between the emancipatory potential of Marxist theory and the repressive actualities of its practice, why there is this tenacious re-emergence of authoritarianism and dominance in social structures even after struggles to overthrow them have taken place, how one explains the eternal, interminable contest between freedom and control, why there is limited scope for dissent in democratic organisations and so on.

At the risk of stating what must be elementary to *EPW* readers, I may be allowed to reiterate that for classical Marxist theory, society is a totality, a historically produced whole, whose most fundamental relation-

ships are production relations. The whole question of the individual-society relationship turns on labour as the constitutive human activity and productive relations as framing political activity [Marx and Engels 1845-6/1970 58]. Individuals are the carriers of abstract historically produced relations - they are the personifications of economic categories, embodiments of particular class relations and class interests" [Marx 1867/1946 21]. It was only in subsequent Marxist theory, feminist theory and other emancipatory discourses that the questions of identity and agency became key points of contention and led to increased interest in the analysis of 'superstructural' phenomena and in processes of cultural reproduction. It is not necessary here to go at length into these issues but briefly in the development of western Marxism theories have tended to cluster around two themes. Gouldner (1983) refers to the two Marxisms' as 'scientific' and 'humanist'. Howard (1977) speaks of materialist and idealist strains. As Hall (1981) points out, both approaches developed in reaction to 'economism', the reductionist interpretation of the base-superstructure metaphor into which political Marxism congealed in the early 20th century. This is perhaps what BG refers to when he says, "The elaboration of its technical capabilities by the human species in its struggle to win a livelihood from nature has been given a central place by Marx in the notion of human progress. This elaboration is based on the specific physical structure of human beings, such as the possession of two hands to work with and a brain capable of an elaborate learning process. But this understanding is incomplete, without supplementing it with an understanding of what human beings have done for themselves with their moral potential, and what future that indicates for the species."

Any discussion of subjectivity has to necessarily take us to psychoanalysis which studies the origins and nature of subjective experience. I will restrict myself to Freudian or classical psychoanalysis since both BG and more extensively, his *Aruna Tara* readers have referred to the theory. One is wary and aware that one is treading on unsteady and dangerous ground because of the reckless 'psychologising' that is going on in present times with Freud's ideas often vulgarised beyond recognition on the one hand and, on the other, because the reference to Freud at once brings in the dismissive comment that the attempt is inimical to the Marxist position and therefore needs no further attention. After all these years, Freud certainly needs no defence, nor is there any necessity to refer to all those attempts to reconcile the Marxist and the Freudian positions. But what I do wish to emphasise here is that the social scientist who stresses

the primacy of the causal impact of economic conditions, technological innovations or class struggles need not yield up or abandon these objective influences on human action to substitute, in their place, the irrepressible drives, the persecutions of the superego, the warnings of anxiety, the mechanisms of defence and such of the concepts in the psychoanalytic arsenal and reduce adult historical actors to bundles of persistent and unresolved childhood symptoms. We are not assigning primacy to psychological factors alone, as does mainstream psychology, but only recognising that the psychological processes play a significant, though neither exclusive nor exhaustive, role in human behaviour. If one can reduce the diversity of Freudian thought to a single statement, one can perhaps say, "the most fundamental insight of psychoanalysis is that the wish, the emotion, and the fantasy are as important as the act in man's experience" [Gay 1985:173].

This is not to suggest that society can be understood simply by offering explanations of individual minds at work nor is it to prescribe the proverbial individualism of psychoanalysis as a basis for social change. Undoubtedly, and to put it rather coarsely, human beings, in the Freudian system are instinctual beings, the achievement of pleasure through the expression of those instincts being the aim of life. However, when Freud defined psychoanalysis as the "study of the vicissitudes of the instincts" he was not denying the "plasticity" of human nature. The drives or instincts of psychoanalysis are not fixed dispositions to behave in a particular way; they are utterly subject to social channelling and transformation and could not reveal themselves in behaviour without social moulding. However, although the self for Freud is formed by its culture, he also sees the self as set against the culture, struggling against it, having been from the first reluctant to enter it. Culture, in short, is indispensable and stifling at the same time. What may rescue the individual is paradoxically his or her instinctual urges. Here the Marxists among us may cry a halt and indicate that at this point there is a decisive departure of ways (if at all there was any meeting ground earlier). But let us see further what Freud has to say. Freud's insistence on the drives' unremitting search for pleasure which is anchored in the individual's essential endowment need not be interpreted as a reactionary notion. For it proposes to us that culture is not all-powerful. The resistance to cultural control suggests that somewhere in the human being "there is a hard, irreducible, stubborn core of biological reason which culture cannot reach and which reserves the right, which sooner or later it will exercise, to judge the culture and resist and revise it" [Trilling 1955:48; emphasis mine]. This 'core' could also be formed by the notion or ideal of humanity which people

possess and desire to achieve when they rebel against oppressive circumstances and transcend their present.

This exposition of Freud's conviction about the dialectical interplay between the individual and her/his culture shows that the 'social share' in the individual's mind formed by her/his class, gender or caste status and the vicissitudes of instincts propelling him/her to achieve pleasure could mean, in the context of struggles, that the search for pleasure is a struggle for equality, freedom from oppression and exploitation and so on. That is, this will-to-pleasure need not be disparaged as mere self-indulgence. Any activity directed towards amelioration of others' suffering and oppression or in other words, towards 'socialistic' aims also may in the final analysis be based on an operation of the pleasure principle only since such activities can and do bring about pleasurable fulfilment for those who pursue them and are in consonance with their needs.

Conversely, in Freudian terminology, the instinct to death is manifested in aggression and destruction. However, the two instincts of life and death, according to Freud are found in a fused state in the actuality of behaviour and in the end represent the entire struggle for life. Peter Gay (1985:210), the psychoanalyst-historian says, "historians reluctant to acknowledge the value of psychoanalysis as an auxiliary discipline have found uses for it as they fail to discover rational causes for panics or riots, for outbursts of bigotry or self-destructive behaviour".

Freud's formulation seems to balance precariously between a description of the individual as a biological entity with her/his essence residing in specific drives, and a complex account of the social construction of that individuality through the exposure of the human being to particular social structures. A crucial process by which society operates is to introduce into each individual its own ideological seeds, which then become the generative kernels of emotions, attitudes and modes of relating to others – in other words, of mental or psychic organisation. Which one is causally prior, the psychic or the social, is, I think a belaboured philosophical point and is of limited practical value in the present context.

If as Marx (1845-6/1970) says, history is the continual process of human beings creating, satisfying and recreating their needs, this historical process having three moments: (a) the satisfaction of basic needs, (b) the simultaneous creation of new needs, and (c) the production of new human beings, then labour as the basic ontological category perhaps provides only part of the story.

Marx, with a flourish, could define communism as "the genuine resolution of the conflict between man and nature and between man and man – the true resolution of the strife between existence and essence, between objectification and self-confirmation, between freedom and necessity,

between the individual and the species" [Marx and Engels 1975:296]. Can we expect then that the resolution to this conflict should be able to include not only materialist dynamics centred on economic production but psychological processes as well concerned with the formation of identities and agency? More so, as Marx himself conceptualised theory-as-critique as "the self-clarification of the struggles and wishes of the age".

To recognise then that the problem of subjectivity is an uncharted territory in Marxism and that it is not as 'knowable' as objective conditions is, not in my opinion, an abdication of the Marxist position and retreat to the slippery world of idealism. And what is significant is that Marx himself recognised these empty spaces and held that the levels of base and superstructure in society varied in their amenability to scientific treatment. Making a distinction between the materialist transformation of the economic conditions of production and the "legal political, religious, aesthetic or philosophic – in short, ideological forms in which men become conscious of this conflict and fight it out" Marx does acknowledge that the 'ideological' forms cannot be understood with the precision and certainty of natural science as the economic conditions can be.

I am aware, however, that while an inclusive theory could have some explanatory value and while knowledge and understanding of subjective processes could sensitise us to the needs and irrationalities of the individual, it falls short of spelling out how such an inclusive understanding could bring about change, both individual and social. That is why perhaps even when we ask questions related to human subjectivity or 'idealist' questions we need to come up with Marxist answers. And that is the reason why perhaps attempts like that of Balagopal only shift the horizons without appreciably enlarging them.

[I gratefully acknowledge the comments of Randhir Singh and Praful Bidwai. Any errors of interpretation are of course only mine.]

**IDBI ASSURANCE
ANYWAY YOU
LOOK AT IT!**

**Every month.
Every quarter.
All at the beginning.
All at maturity.**

YOUR FOUR-WAY OPTION WITH IDBI'S FIXED DEPOSIT SCHEME*

TYPE	MINIMUM DEPOSIT	YIELD STRUCTURE
Monthly Income Option	Rs.18,000	Rs.185 every month on a 5 year deposit of Rs.18,000.
Quarterly Income Option	Rs.10,000	Rs.325 every quarter on a 5 year deposit of Rs.10,000.
Lumpsum Discounted Interest	Rs.10,000	You will get Rs.4,572 immediately on a 5 year deposit of Rs.10,000.
Cumulative Option	Rs.10,000	A Rs.10,000 deposit becomes Rs.18,572 in 5 years.

* Interest upto Rs.13,000 on the above deposits is tax-exempt under Section 80L of the Income Tax Act, 1981.

MINIMUM DEPOSIT: Rs.10,000

Beyond the minimum amount, you can deposit in multiples of Rs.1,000. The base interest rate for

a three year deposit is 12.5%. And a deposit period of five years and more fetches a base rate of 13%. What's more this

deposit comes with the guarantee of India's

premier development bank - IDBI. Reflected in the FAAA rating by CRISIL given to this product indicating the highest degree of safety. Naturally, an organisation that has total assets of over Rs.36,000 crores can take very good care of your investment. For more details contact your nearest IDBI office or any authorised IDBI agent.

This opportunity is open to: * Resident Individuals * Hindu Undivided Families * Partnership Firms * Companies/Societies Corporate/Societies * Trusts/ Association of Persons.

Rajiv, a valued customer, has discovered the advantage of getting his Home Loan sanctioned before he started his search for a house. Because the moment he found a house that met his approval, the money was ready and waiting! Rajiv not only saved himself from needless anxiety, but also valuable time and money. HDFC sanctioned his loan, based on his repaying capacity and scrutiny of basic documents. Soon after he found his house, HDFC was able to disburse the loan quickly as the loan had already been sanctioned.

"Getting my loan sanctioned from HDFC even before I found a house, saved me a big headache."

HDFC
HOUSING DEVELOPMENT FINANCE CORPORATION LIMITED

Regd. Office: Bombay.

Loan Amount (Rs.)	Rate of Interest (% per annum)
0 - 25,000	12.00
25,001 - 1,00,000	15.00
1,00,001 - 3,00,000	15.50
3,00,001 - 10,00,000	16.00
Above 10,00,000	16.50

All Rajiv had to do to get his loan sanctioned was, fill in the **Free Home Loan Application Form**.

And submit his passport size photograph, a cheque for the processing fee and his latest salary slip. If he was self employed, and not a salaried employee, he would have needed his computation of income. (Profit & Loss Account and Balance Sheet, for the last 3 years).

Now, all you have to do is contact us. We are at your service.

Vol XXX No 44

Working Mothers and Child Survival

There is evidence that in rural India working mothers experience a greater degree of child loss than do non-working mothers. It has been suggested that time is probably the most important factor in this context: other things being equal, a non-working mother can provide more time for child care.

Whether, however, this conflict between work outside the home and time for child care can lead to the observed large difference in child survival needs to be probed further.

2802

Imaging Modernity and Nationhood

The terms of modernity and nationhood, often deemed to be restricted to a dominant elite ideology suppressive of other identities, may actually allow for a greater plurality of voices, if we care to listen to them. An analysis of popular Bombay cinema.

2804

Unemployed and Self-Employment

NSS data provide alternative estimates of employment and unemployment for rural and urban households as well as for male and female labour force, but several interesting aspects, such as the socio-economic background of the employed and the unemployed, job preferences of the unemployed and obstacles to and factors motivating self-employment are not touched upon. An exploration of some of these issues through a sample survey in Trivandrum district of Kerala.

2814

Exporting to Russia

In the context of the economic liberalisation taking place simultaneously in the two countries, the potential for expanding trade between India and Russia is very considerable. A number of complexities and contradictions, however, stand in the way of the growth of India-Russia trade relations on a sound basis.

2780

Unto This Last

The quintessence of Ruskin's and Gandhi's thought is fully reflected in the title of Ruskin's *Unto This Last*. Add to this Gandhi's emphasis on non-violence. Other aspects of their thought are contextual and could be — should be — revised and redesigned to synchronise with the ongoing technological revolution.

2793

Imagined Boundaries

The idea of being a speaker — and, increasingly, a reader and writer — of one language exclusively and associating that language with a national or ethnic identity is a modern phenomenon.

2783

New Agenda

The emergence of a consensus among major opposition forces in Sudan on self-determination as the key to peace has posed a serious challenge to the National Islamic Front regime.

2791

Movements and Method

Subject has always been a problematic in Marxist theory, since contradictions posed by the subject have been understood as having an explanation in the object, and contradictions in the object as the summation of the contradictions in the subject. However object is not a summation of the subjects, since interaction of the subject is not only with the object but also between the subjects.

2827

Lawlessness as Law

The strong nexus between the police and the state government continues to deny justice to the victims of faked 'encounters' in Andhra Pradesh.

2787

Politics, Not Parity

Devaluation by Pakistan will only push up inflation, already high, without necessarily improving the balance of trade. The real obstacle to higher exports today is not the rupee/dollar parity but the anarchic political situation in Karachi.

2789

Anthropological Follies

This year marks the silver anniversary of the English publication of what is arguably the single most significant study of Indian society by a western scholar in this century. Even today Louis Dumont's *Homo Hierarchicus* is capable of generating as much heated academic debate as when it first rolled off the presses.

2785

World Bank on Labour

JAN BREMAN (September 16) criticises the latest *World Development Report* of the World Bank, which deals with labour in the globalising world economy. Most of his criticism is not justified. The report is not a hard-liberal manifesto or manual, but a balanced document. The emphasis on both growth and targeted state intervention for the poor and for the social sectors, like basic (female) education, is maintained. That the role of labour is dealt with mostly in economic terms can be defended given the importance of raising of living standards, for which raising of wages and therefore productivity is essential.

Breman's remark that the Bank's priority for basic education implies neglect of poor adults is very strange, as well as his remark that the Bank promotes 'informalisation' by criticising the elite and inequality strengthening policies of many settled and politicised unions in the south. These normally strengthen the privileges of a small protected group of employees. Even here the Bank gives a number of balancing statements concerning the positive social, political, as well as economic role of many unions.

Breman clearly overlooks the very clear indications that improvement of the position of organised labour results in deterioration of the position of informal labour, often even in an absolute sense. According to Breman, in the World Bank policy unorganised labourers are doomed to stay where they are. How is this statement compatible with the policies towards basic education and health care, towards micro-credit along the lines of Grameen Bank in Bangladesh, and especially towards getting rid of the urban and industrial bias in economic policy? Nothing in the report or other recent Bank documents suggests that the poor should wait for wealth to trickle down.

More than anything else, artificial privileging of organised labour undermines access to this sector, and therefore keeps this sector small. Every policy that imposes western social standards in developing countries does the same, as well as policies that do not take into account the fact that a number of Asian countries have been able to decrease the number of poor by hundreds of millions. These countries have 'two pillar' strategies, in which economic growth is an

essential, but not sufficient condition. Without exception, these countries have integrated in the world economy (sometimes after a period of relative seclusion), as well as massively invested in basic needs such as education.

Neither these policies, in which, admittedly, there is (still) no place for North-West-European welfare standards, nor World Bank policies have anything to do with 'social darwinism' or 'capital mastering over labour'. The idea of capital and labour being inherently conflicting units is very old-fashioned. Productivity growth is the only way to raise incomes permanently, and is therefore good for not only 'capital', but 'labour' as well.

Breman overlooks very moderate remarks in the report, like the one that (higher) minimum wages need not to be at the expense of employment, that, in case of market power of employers, a small increase of the minimum wages can even raise employment and that in a number of cases union action does have increased income equality.

This is part of the analysis; as far as recommendations are concerned, the report states that (for south Asia and China) "the strong tradition of support for income stabilisation in informal and rural labour needs to be maintained and supported, especially in terms of public works and basic safety nets". And indeed, in India the Bank finances a social safety net programme costing hundreds of millions of dollars

targeted to employees of restructuring state enterprises.

According to Breman, the Bank is not interested in distribution of income and assets, at the national or international level. Indeed, in many low income countries there is not much to redistribute. Besides redistribution is politically difficult. The Bank does recommend agrarian reform in sub-Saharan Africa, as "most pressing concern for the majority of poor farmers". The bias disfavouring small and informal business and agriculture should disappear. It is true that in low-income economies growth, rather than redistribution, is considered of the utmost importance, for reasons of simple political realism.

As far as international redistribution is concerned, the only effective way to achieve this is not income transfers, undermining self-respect, savings and taxation more than anything else, and therefore not being effective, but opening of western markets in the first place.

Besides, there is lots of difference between an increasing north-south gap combined with increasing incomes in the south, and an increase of this gap combined with stagnating or declining incomes in the south. Therefore Breman should not overemphasise the importance of only relative magnitudes, and underemphasise the actual growth in the south

Interest Rates in Disarray

CLOSE on the heels of the instability and uncertainty on the exchange rate front and the sizeable depreciation of the rupee, there has occurred greater instability, speculation and shooting up of interest rates in the inter bank call and overnight money market. Reflecting the growing shortage of liquidity in the system, the call rates had been firming up since the middle of September, ruling in the range of 15 to 20 per cent. Towards the end of October, they touched 25 per cent and on November 2 they were quoted at 85 per cent when the RBI refused to inject liquidity, taking the position that there was enough liquidity in the system and that the sharp rise in the rate reflected the panic reaction of bankers who had not done their homework. But the very next day, exactly in the way it reacted on the exchange rate front, the RBI was forced to inject liquidity to the tune of nearly Rs 1,000 crore, which brought down the call rate from 85-87 per cent, though only to 40 per cent. It is obvious that on both fronts, RBI intervention has provided only temporary respite. Both markets are now precariously balanced.

The RBI's predicament is of its own making. Rather than using monetary and credit policy instruments to serve the development process with flexibility and with freedom to act as demanded by the occasion, the central bank has opted to give primacy to market forces, though the financial markets remain inherently monopolistic, structurally deficient and basically inefficient. The RBI paid no attention to the growing organisational weaknesses of the commercial banking system in particular, and the financial system in general, and their failure to operate a socially oriented credit delivery regime, and instead opted for premature liberalisation of financial policies, putting its faith in competition among banks and financial institutions as the primary instrument for achieving improved efficiency in the system. The end result has been that there is neither competition and efficiency nor a stable financial environment for the productive sectors of the economy.

The inefficiency of the system is nowhere more conspicuously reflected than in the levels, term structure and gyrations of interest rates. Interest rates have soared and their term structure has become distorted and fluctuations in them have become too wide and too frequent. Call money rates of 40 to 80 per cent may apply only to small amounts of marginal funds, but the psychology of bank officials at the credit delivery stage gets influenced by them and those who have to bear the brunt of this turn out to be the weaker segments of the economic system. The rates of interest charged by banks to a majority of borrowers now apparently range from 20 to 25 per cent. What is more, the client classification and credit rating arrangements of banks decidedly favour the big-size and financially rich

companies, with little consideration for social priorities and productive nature of the activities. The interest rate instrument has thus become a weapon to widen the hiatus in the productive sectors, with the heaviest burden placed on the medium and small and the informal sectors. Two elementary lessons in monetary theory have great relevance for the situation obtaining in India now. First, overwhelming reliance on monetary policy as a stabilising force involves large and rapid changes in interest rates and in consequence a high degree of volatility in bond prices, leading to an environment of uncertainty for productive investment. Second, high interest rates favour the unproductive sector, relatively more and work to the advantage of social parasites, thus hurting both equity and growth. There is no doubt that the high interest rates of the past few years have stimulated the money lending activities of the non-banking financial companies and firms, speculators in the capital market, traders and those engaged in real estate speculation.

As with the sudden depreciation of the rupee, there have been immediate factors triggering the call money rates, such as the outflow on account of the Rs 1,500 crore auction of 14 per cent state loans, the Rs 1,100 crore third instalment payable on a government of India loan, Rs 1,800 crore moving out of the banks as allotment for the IDBI issue and approximately Rs 1,200-1,500 crore as the purchase price of the US dollars injected by the RBI to minimise rupee depreciation. The underlying malaise, however, is the shortage of domestic saving which is not of a temporary nature. Aggregate banks deposit growth in the first half of 1995-96 at Rs 9,516 crore or 2.5 per cent has been the lowest for any half-year period; in the corresponding period last year there was a rise of Rs 18,420 crore or 5.5 per cent. On the other hand, demand for bank credit continues to be brisk. Despite sizeable mobilisation of tax revenue, central government finances remain strained. The use of ad-hocs, which had fallen to around Rs 6,500 crore during a few weeks of September, has again jumped to Rs 10,610 crore as of October 6 or Rs 9,395 crore on October 13, thus again piercing the Rs 9,000 crore limit. Increase in net RBI credit to the central government has also shot up from Rs 8,714 crore as of September 29 to Rs 13,843 crore as of October 13. Subsequently, subscriptions to 91-day treasury bills have been considerably less than the targeted amounts, with Rs 156 crore devolving on the RBI. Likewise, the response to the Rs 7,000 crore disinvestment of PSU equities by the government has been niggardly. All these developments are taking place at a time when government expenditures are growing beyond the budgeted amounts.

When such is the acute shortage of investible resources in the economy, the attempt to ration their use through the blunt

instrument of interest rate alone is bound to be counter productive. A viable option would have been to regulate the structure of interest rates at a realistic level and combine that with rigorous quantitative guidelines on the distribution of bank credit. For some years to come until the financial system acquires competitive strength and the informal sector attains a degree of resilience, the earlier system of prescribing minimum and maximum of lending rates for banks is the only viable one for ensuring that the activities of institutional agencies do not partake the character of the activities of the age old traditional money lenders. The argument that small borrowers anyway pay usurious rates of interest to the informal credit agencies and hence can bear high rates of interest on their borrowings from banks and institutions is spurious. Apart from the question of equity which justifies a progressive structure of interest cost, it is pertinent to ask if even the organised sector manufacturing projects could be viable at such usurious rates of interest and if not, what economic rationale is there except their weak bargaining strength, for charging such high rates to small and medium manufacturing units?

The same principle of regulation and prescription of a minimum and maximum rates needs to be applied to the inter bank overnight and call money rates. In a competitive and developed financial system such prescriptions would not be necessary and, even if necessary, could have been left to self regulation by the banking industry. Even in many advanced country money markets call rates are either targeted or prescribed from time to time by the monetary authorities. Given the structure of the banking industry here, self-discipline just cannot work. Therefore, it is imperative that the RBI intervene and prescribe a range of, say, 12 to 25 per cent for overnight call money borrowing (linked to some notion of an average cost of deposits to banks at the margin at the one end and the possible ceiling of about 20 per cent on bank advances at the other). The minimum of 12 per cent on call money borrowing is justified on the ground that lending by some of the low deposit base banks needs to be curbed so that serious liability-asset mismatches are not created by resort to excessive dependence on call money. Call money rates beyond 25 per cent should be considered as a sign of the system's weakness and a source of destabilisation.

The instability and distortions in the present interest rates structure are distinctly reflected in the failure of either the RBI or the market to evolve a 'reference rate' around which other rates in the system could be expected to constellate. In its Annual Report for 1992-93 the RBI had hoped that once prescription of interest rates by it was minimised, it could declare one of its interest rates as the 'reference

rate' and a convention developed whereby banks would take cognisance of this reference rate and fix their deposit and lending rates accordingly. In the following year's Annual Report the RBI thought that the cut off yield rate on 364 day treasury bills had already emerged as a benchmark as some of the players were using this rate for fixing other rates. However, very soon with the liquidity situation undergoing a sea change, the cut off yield for the 364 day TBS ceased to have any credibility with very low levels of subscription and only 25 to 30 per cent of the bids being accepted. It has obviously assumed the character of an administered rate. The yield rates on dated government securities even under the auction system or those prescribed under the pre-determined coupon system (at such high levels as 14 per cent for central and state government securities) have turned out to be very high and unsustainable. In the circumstances RBI thinking seems to have now come full circle with the authorities realising that no single rate could yet emerge as a reference rate. The authorities now admit to some difficulties in introducing a reference rate as a mechanism for signalling to the market. In many countries the instrument of the bank rate or discount rate provides the signals. While the authorities have recognised that for the bank rate to become operative here it must be a rate at which the central bank operates a refinance or rediscount window on a noticeable scale, they hold that this is not the right time to introduce [an effective refinance mechanism] because we are already concerned with over-expansion of credit. They evidently think that providing a refinance window would send a wrong signal to the banking system. According to the RBI only when the present pressures diminish could the bank rate be brought in as a reference rate. This is the outcome of the narrow approach of monetary targeting and is faulty on many counts. First, the thinking that a refinance window can only be for influencing the size of aggregate credit expansion is flawed, it can be a more potent instrument for influencing the distribution of credit. In this respect, the recently introduced RBI refinance facility against banks' holdings of government and other approved securities will have limited use except for encouraging banks to hold excess SLR securities. Second, there has been a significant fall in the share of priority sector advances in total bank credit in the recent period and so this is indeed the right time to introduce a refinance/rediscount window against lending in favour of specified priority sectors. If such a credit policy regime does not yield a unique reference rate, so be it. Ensuring adequate credit to the productive sectors should be the overriding objective of the central bank, not evolving some esoteric 'reference rate'.

BJP

Spreading Dissidence

THE national convention of the Bharatiya Janata Party (BJP) in Bombay takes place at a time when the party has been shaken by the recent turn of events. The Waghela episode had its spread effect across all the state units of the party with each unit throwing up its unique pattern of dissidence.

If Shankersinh Waghela targeted the supremacy of the Narendra Modi-Keshubhai Patel faction in Gujarat and Kalvan Singh had his differences with the party leadership over supporting the Mayavati government in Uttar Pradesh, the Maharashtra unit of the party has staged a revolt against the party general secretary Pramod Mahajan, for his 'dictatorial' handling of state affairs. Waghela gave voice to the discontent among the Gujarat unit over the excessive intervention of Narendra Modi, an RSS man, in the state government's decision-making. The protest in Maharashtra in contrast is led by an RSS old timer and an ex-MLC Madhu Deolekar, against the 'five star culture' introduced by Mahajan in the party organisation. Deolekar roughly estimates that fifty sixty thousand rupees are spent per month on the Maharashtra and Bombay units and voices dissatisfaction over the eclipse of the ascetic virtues of the 'sangha samaskar' among the newcomers. The schism in Maharashtra reflects the clout the party fund raisers like Pramod Mahajan, Kirit Somaiya and Prakash Javdekar have gained over the organisational structure, sidelining grass roots party workers like Madhu Deolekar, Wamanrao Parab, Ram Kapse and Madhukar Desai.

But the dissent in Maharashtra also has another dimension. This has to do with perceived capitulation of the state BJP leadership on contentious issues to its coalition partner the Shiv Sena. The release of the TADA detainee and film star, Sanjay Dutt, which has been welcomed by Shiv Sena chief Bal Thackeray, has upset the BJP's student wing, Akhil Bharatiya Vidhyarthi Parishad (ABVP), the Bajrang Dal and the Vishwa Hindu Parishad who were in the forefront of a campaign against the actor. What has further irked them is Pramod Mahajan's open endorsement of the court's decision. The opening of the renegotiation with the Enron is read as another instance of the Shiv Sena gaining the upper hand over its 'junior' partner. This has led to tension between the BJP and the Swadeshi Jagran Manch with the latter threatening to reactivate its stir against the Dahhol power project. The enfeeblement of the state BJP has been underscored by the drubbing it received at the hands of Shiv Sena in the Kalyan and New Bombay municipal polls. Already Thackeray's demand for Lok Sabha seats has risen from 18 to 24, and it is feared that as the polls

approach Thackeray will assume a more virulent posture. Shiv Sena too has its own worries with the Supreme Court judgment in the petition against state chief minister Manohar Joshi due this month. In anticipation, the party's rising star and Bal Thackeray's son, Udhav Thackeray, has announced a prospective restructuring of the party and unbelievably Bal Thackeray has tendered an apology to the Supreme Court in the contempt of court case involving him. Thus faced with its own problems, Shiv Sena is trying to make the most of the setbacks BJP has suffered.

The BJP may put up a brave face in the coming national meet after having succeeded in temporarily quelling the dissidence, but the uneasiness will continue. The jolts received by the party has led to the postponement of organisational elections in Rajasthan, Gujarat, Madhya Pradesh and Uttar Pradesh. Just beneath the surface, the tussle between L. K. Advani and Atal Behari Vajpayee is also on. Though Waghele has declined to lead and speak for the dissidents at the Bombay convention, addressing the growing indiscipline in the party will be uppermost in the mind of the central leadership.

CORRUPTION

Misguided Solidarity

A correspondent writes

THE much-advertised strike by the customs officials at the New Delhi airport, which fizzled out within four days, is an ugly sign of the growing trend to use popular weapons of protest by the privileged sections of our society to legitimise their unjust demands, even to the extent of justifying their right to take bribes! The strike was triggered off by the arrest of 15 customs officials, including superintendents, inspectors and an examiner by the CBI on October 17, after the recovery of Rs 1.15 lakh unaccounted money, partly from the persons of some of the officials and partly from boxes and office tables where the money was stacked.

The arguments of the advocate employed by the striking customs officials in order to obtain bail for their arrested colleagues, as presented before the special judge handling the case, reflect the smug mood of being able to get away with anything that prevails among these senior officers of the customs department. The advocate contended that the arrested customs officials deserved bail because they were government servants and the amount recovered from them was petty. The obvious implication is that government servants should be considered as a special category of citizens who are above the normal laws applicable to all, and - what is even more detestable - that they are allowed to take bribes, as long as the amount is 'petty' (a term, which in financial transactions, has a variable connotation, depending

on the class composition of those involved in the transactions) suggesting again that the quantitative aspect of the dispute relating to the amount of money taken as bribes prevails over the qualitative aspect of the behavioural norms and moral values expected to be followed by the customs officials.

These legal arguments on behalf of the striking customs officials are actually buttressed by the social mood that prevails among the Indian urban middle and upper middle classes which sanction certain norms of conduct - bribery, nepotism, embezzlement, defrauding and, on some occasions, even murder - that are recognised as necessary to sustain high living in this society. Following the arrest of the customs officials, one could discover in the Delhi elite circles voices which were sympathetic to the cause of these officials. Their arguments ran on the following line: 'If politicians can earn crores through dubious deals with Bofors or notorious Bombay stock brokers, what is wrong with the customs officials making a few thousands or lakhs on the sly?' It seems that bribery, which is elevated to the status of 'commission' or looked down upon as 'cut back', has not only come to stay, but is awaiting endorsement in the form of a legal enactment to be framed in the usual ambiguous terms that mark our legislations.

The customs department in particular has acquired the reputation of offering young unscrupulous employees easy avenues for making a fat buck, with the acquiescence of course of their seniors, as evident from the recent revelations. In the universities of the metropolis in cities like Delhi, students make no bone about their career priorities.

First the customs, followed by the income tax department and the police service, with the IAS as the last option, and are equally unabashed in explaining why they decide to choose these services in that order. Even inside the customs department, there are priorities - the export and import wings of the cargo terminals in the international airports being considered more lucrative than the baggage wing. In these two most sought after wings also, there is a scramble for duty during what is termed as 'prime time' - the afternoon shift when there is the maximum load of clearance of import and export cargo, which understandably offers the maximum opportunity of illegal monetary deals between importers and exporters on the one hand and the customs officials on duty at the airport on the other. In fact, according to the CBI sources in Delhi, it was one of the disgruntled customs officials who was shunted out from such a lucrative post who tipped off the investigative agency about the goings on in the export cargo terminal of the Indira Gandhi International Airport which led to the arrest of the customs officials.

One could have dismissed the case as an isolated instance of aberration and misdemean-

nour by a coterie of customs officials, but for the extraordinary demonstration of solidarity behind them by the rest of their colleagues. It is this which is disturbing. The professional team spirit is being extended to support unprofessional misdeeds. We have seen a similar display of camaraderie among policemen in Bihar when some of their colleagues were prosecuted for blinding prisoners in Bhagalpur which set them on a mini mutiny in protest. The IAS fraternity is no less belligerent whenever it comes to defending any errant colleague of theirs. Even judges are known to have betrayed similar peevishness on occasions when some from among their brotherhood had been criticised for unprofessional behaviour and even to take recourse to the weapon of contempt of court to silence the critics.

Fellow feeling among colleagues in a profession is understandable. But when such solidarity is displayed in support of anti-social activities of the black sheep of the professional community, agitations on their behalf are bound to lose public sympathy, as is evident from the fate of the strike of the customs officials.

EXCHANGE RATE

Market as Alibi

If sources in the commerce ministry are to be believed, the depreciation of the rupee vis-à-vis the US dollar was nothing but contrived. As reported, the commerce ministry was kept informed about the expected decline of the rupee about two weeks before the RBI decided to withdraw temporarily from the market. It is doubtful though that the commerce ministry was made privy to the whole plan, even though it had been pre-warned of the impending major depreciation of the rupee.

It is clear now that the major factor behind the rupee's depreciation was none other than the injection of major demand arising from the government to make its debt service payments in pursuance of the decision to route such payments and those required for the purchase of essential import items like oil, food and fertilisers on government account through the exchange market. The latest *RBI Annual Report* is quite explicit about this decision as being in consonance with the ongoing efforts to reform the exchange markets in India so as to better reflect the demand and supply position of foreign exchange. The point however is whether, with the injection of such demand in the exchange market, particularly the demand arising on account of debt servicing, the volatility of the market is increased or decreased and in which direction. Not that the debt servicing obligations were not being met earlier when the RBI directly covered them at the prevailing exchange rate of course, but out of its holdings of foreign exchange. But then the market stood in-

vulated from periodic ups and downs arising out of irregular demands of this type.

So when the commerce ministry was told that the RBI had 'decided to withdraw temporarily from the market', it was a partial truth in that while a sizeable excess of demand for foreign exchange was being transmitted to the market, the RBI decided not to intervene to ensure that it did not upset the balance and in the process forswore the main objective of exchange reserves, namely, of providing a cushion against temporary fluctuations in demand and supply in the exchange market.

Whether or not the rupee stabilises at Rs 34.50 to a dollar as commerce minister P. Chidambaram assures us or is made to decline further, as is being widely suspected, it is clear that the sizeable exchange reserves accumulated over the past four years will be unavailable for smoothening the volatility of the market once the authorities have decided on a change in the exchange rate. But the market will once again provide the alibi.

CAPITAL FLIGHT

Unstemmed Flow

THAT there was taking place some amount of capital flight through under-invoicing of exports and over-invoicing of imports had been known all along. In fact one of the major arguments for trade liberalisation has been that it will reduce sharply the incentives for resort to such practices. Whether or not this has actually taken place in the wake of the various trade liberalisation measures is a moot question. There can be no doubt, however, that capital flight has persisted, going by the scale of gold imports and of consumer goods smuggled in year after year.

A study by three Florida-based economists of Indo-US trade data for 1993 has shown that (a) the amount of capital flight on account of under-pricing of exports to the US and over-pricing of imports from the US in just one year could have been as high as \$4.4 billion against total recorded turnover of \$7.3 billion, and (b) under-pricing of exports accounted for three-fourths (\$3.3 billion) of the possible capital flight of \$4.4 billion. On the assumption that such practices could not possibly be confined to Indo-US trade only, total capital flight in one year, 1993-94, could have been of the order of \$27 billion against the total recorded trade turnover of \$45 billion in that year.

It should be added here that the same study offers a number of alternative estimates of capital flight via trade with the US and the most conservative of these range between \$370 million and \$1.06 billion. At the rate of even \$370 million for Indo-US trade, total capital flight from India for 1993-94 would work out to \$2.3 billion, whereas at the rate of \$1.06 billion for Indo-US trade the total would work out to \$6.5 billion.

The question to answer is whether capital flight currently taking place is as high as \$27 billion or as low as \$2.3 billion. The only way one can get some answer to this question is to look at the situation with regard to gold imports, which enter the country partly through legal channel and partly illegally. Estimates are that in the past four years total gold import has spurted from 200 tonnes in 1991 to 480 tonnes in 1994, the former figure comprising almost entirely of illegal import and in the latter case the proportion of illegal import being close to 60 per cent. But this distinction between legal and illegal import is of little

significance from the point of view of their financing, because the source of such finance has to be more or less the same. At the rate of 480 tonnes the foreign exchange required would work out to \$5.8 billion at the prevailing world prices. In addition, it is widely believed that large-scale smuggling of consumer items and components continues unabated, for financing which too exchange would have to be found. It is therefore quite possible that capital flight from the country to finance gold imports and illegal smuggling may well be close to \$10 billion. To that has to be added what people accumulate and hold abroad.

CENTRE FOR DEVELOPMENT STUDIES

Prasanthnagar, Ulloor, Thiruvananthapuram 695 011

Tel (0471) 448881 Fax (0471) 447137 E-Mail: sscds@ren.nic.in

Applications are invited for the award of **Doctoral Fellowships** under the following schemes tenable at the CDS

■ ICSSR Institutional Fellowships (Research area *Economics*)

- Three in the Open Category • One with Salary Protection#

■ RBI Endowment Fellowship (Research area *Economics*)

- 1 No. in the Open Category

■ Sponsored Research Programmes (Research area *Economics*, with emphasis on (1) *Local Level Development* & (2) *Environment, Poverty Alleviation and Sustainable Development*)

- Open & with Salary Protection# (number to be decided)

for University/College Teachers & Research Staff

The CDS Doctoral Programme offers registration under Jawaharlal Nehru University, New Delhi or University of Kerala, Thiruvananthapuram, research work to be carried out under CDS faculty supervision.

Value & Maximum Tenure of Fellowships

- Monthly stipend Rs. 2500 for first two years and Rs. 2800 for subsequent period; • under Salary protection, the pay and allowances drawn in parent institution; • Annual Contingency Grant Rs. 5000.
- ICSSR & RBI: 4 Yrs. • Research Programme Fellowships: 3 Yrs. & • ICSSR Salary Protected: 2 Yrs.

Eligibility

- Age less than 35 years on 1.1.1996 (40 years for SC/ST/Women)
- Post-graduation with at least 55% marks
- IRFT/NET by UGC/CSIR (for ICSSR Fellowships only)
- JNU Doctoral registration requires M.Phil (min. FGPA 6). University of Kerala requires M.Phil or clearing its own test/UGCNET.

How to Apply

Please send typed bio-data and research proposal to the Registrar, Centre for Development Studies, to reach on or before **November 30, 1995**.

- The bio-data should give personal particulars like age, name of parent, permanent and communication addresses and academic record from SSLC (Course, Subjects, Marks, Class, University, Year).
- The research proposal (in 3000 words) should state the scope, objectives and hypotheses, conceptual framework, review of literature, methodology, justification of the study and bibliography.

October 19, 1995

DIRECTOR

CURRENT STATISTICS

EPW Research Foundation

The annual inflation rate has remained at the single-digit level now for 29 successive weeks (8.23 per cent for the week ended October 14) though the WPI has experienced an absolute decline only on three occasions. The RBI reference rate for the US dollar moved up from around Rs 33.90 in the first half of October to Rs 35.03 in the second half. Forward premia on the dollar reached new levels, spot/cash touching 20.6 per cent and the six-month forward premia 12.8 per cent. The rise in the forward rate has been more moderate than that in the official rate. After being relatively stable in the past few months, call money rates shot up to reach a range of 50-85 per cent in the last few days. In the primary floatations, the yields on 91-day TBs have firmed up from 12.68 per cent to touch the record high of 12.88 per cent.

BAJAJ AUTO

Expansion and Diversification

FOCUSING on the two and three wheeler segment, the Pune-based Bajaj Auto is the third largest producer of two-wheelers in the world. The company started the production of scooters in 1961 with an eye on the Indian middle class which remains its focus of attention. This is borne out by the fact that more than 90 per cent of the company's sales are in the domestic market.

The company closed the financial year ended March 1995 with net sales of Rs 1,789 crore, up by 35 per cent from Rs 1,327 crore in the previous year. Other income rose to Rs 133 crore from Rs 78 crore, an important component being interest income which stood at Rs 44 crore against Rs 22 crore in the previous year. Total income rose to Rs 1,919 crore from Rs 1,401 crore. Interest costs came down from Rs 15 crore to Rs 11 crore. The effect of a fall in the provision for depreciation was nullified by a rise in the tax provision. Nevertheless, the company ended up with a net profit of Rs 305 crore, up from Rs 146 crore, a rise of 109 per cent. A dividend of 80 per cent has been recommended by the directors. A bonus issue in the proportion of 1 bonus share for every share held has also been declared.

In 1994-95 the two-wheeler segment grew by about 25 per cent and the average growth rate is expected to exceed 15 per cent over the next few years. The company's market share has been around 72 per cent in scooters, 30 per cent in motor cycles, 14 per cent in mopeds and 95 per cent in three-wheelers. For the year under review the company registered sales of 1,134,072 two- and three-wheelers, an increase of 24 per cent over the previous year's sale of 9,13,102 units. Sale of spare parts crossed the Rs 100 crore mark. Production at the company's Waluj plant crossed 5,00,000 vehicles, an increase of 33 per cent over 1993-94. Production of scooters exceeded one million. The company proposes to introduce new models to respond to growing competition. While incorporating new styles and designs, the focus will be on meeting the new stringent emission norms.

The company's exports during the year stood at Rs 130 crore, an increase of 86 per cent over the previous year. Exports consisted of 50,947 two- and three-wheelers. Columbia, Bangladesh, Sri Lanka, Peru and Italy continued to be major export markets

for the company. Engine exports to China also contributed to the company's improved export performance. The company is eyeing Africa, Mauritius and Latin American countries as potential export markets. A sum of Rs 125 crore was spent on import of raw materials, machinery spares, capital equipment and other expenditure. Identifying export as a major thrust area, the company hopes to increase exports to 12 to 15 per cent of total production by 1998.

Expansion and diversification plans are on the anvil with a sum of Rs 700 crore proposed to be spent on them. Production capacity is to be increased to 20 lakh units per year by 1998 from the current 12,72,000 units. By the turn of the century the company plans to take its installed capacity to two million. The company is planning a foray into the manufacture of mass market-oriented cars which are fuel efficient, spacious and low cost. The initial capacity has been set at 50,000 per annum which will eventually move to 1 lakh. The company has shortlisted Chrysler, Renault and Fuji as possible joint venture partners.

Bajaj Auto Finance, a company promoted by Bajaj Auto, provides finance against two-wheelers, cars, trucks and other consumer goods. The company entering into mass housing projects targeted at the lower and middle income groups at an estimated cost of Rs 100 crore. Also proposed is a joint venture company for domestic portfolio management.

The company has stepped up its research and development efforts to meet the new emission norms by April 1996. It has increased its R and D staff to 500 from 200 last year. To cut fuel emission and improve fuel efficiency the company has developed a three-port engine for its autorickshaw. A two-wheeler scooter with a three-port engine is also being introduced. The company is also working on a new four-stroke engine for its three-wheelers and scooters to meet the new emission norms.

MUKAND

New Projects

Set up in 1937 with a share capital of Rs 14 lakh, Mukand operated its re-rolling mills and foundry in Lahore and Bombay. In 1939 the company was taken over from Lala Mukand Lal by Jeewanlal Morichand and Jamnalal Bajaj. The company is a leading producer of speciality steel in the country and the second largest manufacturer of steel in the private sector. Its product mix includes billets, wire rods, bars, rods and flats of

various grades of carbon, alloy and stainless steel. The group is a pioneer in introducing new technology such as continuous casting and top and bottom blown oxygen steel making.

Turnover for the year ended March 1995 stood at Rs 821 crore, up by 39 per cent from Rs 590 crore in the previous year. Total income increased from Rs 614 to Rs 834 crore and would have been higher were it not for a fall in other income by 34 per cent. Interest costs came down by 8 per cent. A rise in provision for depreciation by 33 per cent was nullified by a fall in tax provision which came down by 80 per cent and the company ended up comfortably with a net profit of Rs 35 crore, up by 149 per cent from Rs 14 crore in the previous year. Turnover rose because of better capacity utilisation and increased demand for the company's products from the automobile and engineering units. Added to this were higher steel prices and improvements in operations. Profits would have been higher were it not for the higher cost of imported scrap and other inputs which could not be passed on to customers. A dividend of 35 per cent has been recommended by directors against 32.50 per cent given last year.

An improvement in the performance by the automobile and consumer durable industries, which consume the bulk of special steels, led to increased demand for special steel bars and rods. Output of rolled products in 1994-95 was 1,97,651 tonnes against the previous year's 1,49,612 tonnes. Sales of the steel foundry were Rs 33 crore against Rs 62 crore in the previous year. Production of steel and alloy castings was 7,767 tonnes against 11,786 tonnes in the previous year. The value of orders received during the year was Rs 40 million compared to Rs 298 million in the previous year, reflecting the lack of orders from the railways for bogies and couplers. In the face of this situation, the company has turned to exports and to production of specialised higher value products like valve castings.

Sales of the machine building division were Rs 94 crore against Rs 52 crore in the previous year. The company has orders worth Rs 988 million in hand. Major orders include cranes, steel plant equipment and cement plant equipment. The division hopes to perform well on account of higher demand from engineering and infrastructural sectors. The machine tool division saw an improved performance. Sale of this division during the year was higher at Rs 9 crore against Rs 4 crore in the previous year, in spite of competition from imported machinery at lower import duty.

Hitherto exporting engineering goods, the company added steel products to its export portfolio. During the year under review, the company stepped up its efforts to enter the US market for castings. Despite competition from China, Brazil, South America and Spain which offer castings at low prices, export of castings rose to Rs 10 crore in the year from Rs 4.5 crore in the previous year. The company has set a target of Rs 125 crore for export of steel and engineering products in 1995-96.

The company is planning to invest Rs 800 crore in new joint ventures. A maximum of Rs 300 crore as equity is proposed to be invested in the joint venture steel project with the Karnataka State Investment and Industrial Development Corporation with a total outlay of Rs 3,000 crore. The initial production capacity of 1.5 million tonnes per annum will be gradually expanded to 3 million tonnes. The company has proposed to develop the Cuddalore port in Tamil Nadu as a turnkey project following the government's decision to involve the private sector in the development of ports. Also on the anvil is a Rs 1,000 crore gas and naphtha-based 300 mw power project in Maharashtra. The company is currently executing a Rs 530 crore contract from SAIL to construct a basic oxygen furnace at Roukela. The company is planning to set up a port in Midnapore district in West Bengal. To be called 'New Bengal Port', the port would cost Rs 800 crore. The West Bengal Industrial Development Corporation is the government sector partner in the project. The company also plans to develop its land at Kurla, Bombay into real estate.

The process of modernisation was begun with the commissioning of an ultra high power electric arc furnace at the Kalwe plant in 1987. To get better quality of steel the company has installed electromagnetic stirrer and auto mould level control equipment. To step up output of bright bars and steel required for exports, suitable processing facilities were installed. The company has obtained new technology in steel foundry for manufacturing patterns and mould boxes for specialised items. The new technology of chemically bonded sand system has also been installed. The steel foundry and the stainless steel coils finishing divisions of the company received the certificate of approval under ISO 9002. Efforts are under way to get ISO 9002 certification for the wire rod mill and bar mill.

JCT

Polyester Complex

The flagship company of the Thapar group, JCT was set up in 1946 as a cotton mill. In 1994 JCT Fibres, its subsidiary

manufacturing polyester filament yarn and polyester staple fibre was merged with JCT. The company manufactures nylon, polyester filament yarn, dyed yarn, cotton textile products, and produces steel wire and tape.

The company closed the financial year ended March 1995 with net sales of Rs 656 crore, up by 70 per cent against Rs 368 crore last year. Other income fell from Rs 29 crore to Rs 10 crore. Total income rose by 58 per cent from Rs 420 crore to Rs 664 crore. Interest costs rose by 211 per cent. Provision for depreciation and tax rose appreciably, leaving the company with a net profit of Rs 65 crore, up by 75 per cent from Rs 37 crore achieved in the previous year. A dividend of 20 per cent has been recommended.

Turnover of the textile division increased from Rs 172 crore to Rs 215 crore despite the high cost of both cotton and fibres. According to company reports, this was possible because of the timely purchase of raw material and diversification to value added fabrics and polyester blended fabrics. The company spread its marketing network with emphasis on making supplies to institutional buyers.

The turnover of the synthetic fibres division inclusive of staple fibre, rose from Rs 170 crore to Rs 447 crore. The total production capacity increased to 30,000 tonnes from 20,000 tonnes in the previous year. Capacity expansion of fibres and filament yarns is going on as a result of which the total capacity of fibres and filament will increase to 64,000 tonnes.

The turnover of the steel division increased from Rs 59 crore in 1993-94 to Rs 68 crore in the year 1994-95, an increase of 16 per cent.

Exports of fabrics increased from Rs 43 crore to Rs 53 crore. Total exports of the company including polyester staple fibres, filament yarn and steel wire showed a substantial growth from Rs 40 crore to Rs 84 crore. In a bid to further improve its export turnover in the current year, the company is working on various other products for the export market. Imports moved up from Rs 14 crore in the previous year to Rs 119 crore.

With the aim of cost reduction, the company is gradually shifting from spindles and looms to high technology machines. The company would be investing Rs 200 crore to expand and modernise its textile division. Of the Rs 200 crore, Rs 150 crore would be utilised for the modernisation of the unit at Phagwara while Rs 50 crore would be utilised for its operations at Sree Ganganagar. The long-term objective of the company is to improve the quality of yarn and start a new venture for processing and

dyeing. The company is setting up a 6,500 spindles worsted fabric plant soon at an estimated cost of Rs 100 crore and is on the lookout for a suitable partner for this joint venture. The company which exports 20 per cent of its cotton and blended fabrics plans to take it to 40 per cent after the modernisation programme is through.

JCT is entering into a joint venture with Giordano, the international ready to wear retail chain. The two will have an equal stake in the new company and will sell their branded products through franchisees. Giordano sells a range of casual ready to wear which includes T-shirts, trousers, and jeans.

The company has entered into a joint venture with a South Korean company, Korea Act Corporation to set up a steel wire rope manufacturing facility in its steel division at Hoshiarpur. The agreement covers import of plant and machinery, technical know-how and services and includes a buyback arrangement by the Korean partner for exports. The total investment envisaged in this venture is about Rs 20 crore.

The company is negotiating with Du Pont of America and Zimmer of Germany for technology to set up a grass roots polyester complex at a cost of Rs 700 crore. The new unit would increase the company's polyester staple fibre (PSF) and polyester filament yarn (PFY) capacities by 1 lakh tonnes per annum. These projects are expected to be completed between January 1995 and July 1996 and will raise JCT's turnover from Rs 482 crore to Rs 1,500 crore in 1997-98. The company's synthetic fibre business is currently ranked second, behind industry leader Reliance. The company enjoys a dominant position in northern India which has the largest market for synthetic fibres and is the prime cotton growing region of the country.

The company has financed its expansion plans with the proceeds of the GDR issue in July 1994. The company floated GDRs of \$ 16.96 each, worth 10 shares. The machinery acquired for modernisation and expansion has reached the site and has been either installed or is under erection.

UNITED WESTERN BANK

Rights Issue

United Western Bank, a leading private sector bank in Maharashtra, is offering 1,80,00,000 equity shares of Rs 10 each at a premium of Rs 30 per share aggregating Rs 72 crore to the shareholders of the bank on rights basis in the ratio of three shares for every two shares held. The object of the issue is to increase the capital base of

the bank and to comply with capital adequacy norms as stipulated by the Reserve Bank. After the present issue the net worth of the bank will cross Rs 100 crore. Domestic private sector banks have been asked by the Reserve Bank to achieve 4 per cent capital to risk asset ratio by March 1993 and 8 per cent by March 1996. United Western Bank has been steadily moving to achieve the laid down norm of capital adequacy. The bank had enlarged its equity base from Rs 3 crore to Rs 9 crore with a 2:1 rights issue in October 1992. The bank went public in January 1994 and fresh equity of Rs 3 crore was issued at a premium of Rs 10 per share. The public issue, which was oversubscribed by more than 10 times, raised the equity base to Rs 12 crore. The present rights issue will enable the bank to achieve 8 per cent capital adequacy by March 1996. The issue opened for subscription on October 16 and will remain open for one month.

United Western Bank's deposit growth in 1994-95 was 8 percentage points higher than that of the banking system. Its advances rose by 42 per cent and net profit after meeting all provisioning requirements, by 165 per cent to Rs 10.23 crore. Export credit formed 13.71 per cent of total advances against the norm of 10 per cent laid down by the Reserve Bank. The bank's foreign exchange turnover crossed Rs 3,000 crore in 1994-95, registering a growth of more than 300 per cent over the previous year. Merchant banking activity too was in high gear and 179 issues were underwritten by the bank. In 146 issues the bank acted as bankers and it was the lead manager for six issues. The directors have proposed a dividend of 22 per cent for the year, 2 percentage points higher than that for the previous year. During the current year the bank plans to expand its network of branches from 197 to 202. Deposits are expected to cross the Rs 1,800 mark and advances will rise to Rs 900 crore by the end of March 1996. 1996-97 is the bank's diamond jubilee year and the bank will enter the year with a solid capital base of more than Rs 100 crore.

India's Exports to Russia Complexities and Contradictions

R G. Gadadhuri

In the context of the economic liberalisation taking place simultaneously in the two countries, the potential for expanding trade between India and Russia is very considerable. There are however a number of complexities and contradictions among them: the multiplicity of trade channels, the lack of transparency in the release of debt repayment rupee funds through so-called tenders, the uncertainties and irrationalities of Russia's import regulations and tax structure and the activities of fly-by-night operators out to make quick profits – which come in the way of the growth of India-Russia trade relations on a sound basis.

INDO-RUSSIAN trade seems to be poised for substantial growth in 1995. The target trade turnover of Rs 5,000 crore set during the Indo-Russian Joint Commission meeting held in July between Pranab Mukherjee, India's minister for external relations, and Yury Yurov, deputy prime minister of the Russian Federation, seems quite attainable given the latest trend in trade performance. This is evident from the fact that during the April-June quarter Indo-Russian trade turnover was about Rs 1,505 crore which shows a nearly two-fold increase over the level of Rs 797 crore reached in the corresponding period in 1994. Furthermore, the Russian side had given an indication of importing in 1995 30,000 tonnes of tea, 20,000 tonnes of tobacco, 10,000 tonnes of soya meal and \$ 100 million worth of medicines. These four items form a special category for which the Russian government calls for tenders in Russia and for which a part of the yearly accumulations of debt repayment amount of Rs 3,000 crore will be used. Both Indian and Russian policy makers may feel satisfied with this improved performance in trade volume as compared to the steep decline in trade in 1992-93 to only Rs 1,700 crore consequent upon the disintegration of the USSR. But this should not lead to complacency on the two sides if the trade relations between India and Russia are to be developed on rational and normal commercial basis from the viewpoint of the long-term benefit of both countries.

In fact, under the process of economic liberalisation that is taking place simultaneously in the two countries, there should be greater possibilities for expanding trade between the two countries. But there are several complexities and contradictions in fully exploiting India's potentialities for increasing exports to Russia.

A major complexity in exports to Russia is the multiplicity of trade channels. At present there are four identifiable routes or

channels each with sub-routes all operating simultaneously. They are (a) Debt Repayment Rupee Account (DRA), (b) Escrow Account, (c) Hard Currency Account, and (d) the unofficial or semi-legal trade channel.

Under DRA of Rs 3,000 crore per year there are two sub-routes. Under the first sub-route there are four commodities falling under special category as already mentioned above. For importing these commodities the Russian government makes some allocation of funds which are finally disbursed through tenders. There is another sub-route which is available for importing from India any other commodity with due permission from the Russian government, whereby a registered firm in Russia can procure rupee funds after paying the equivalent amount of roubles through designated Russian agencies or banks. For getting access to rupee funds from Russian banks under DRA, any registered firm in Russia has to deposit upfront money of 30 per cent in roubles in eight days and the rest of amount in 60-90 days or provide rouble cover by a bank guarantee. Hence there seems to be some advantage for the four commodities under the special category since the Russian government makes some budgetary allocation to the respective ministries for imports from India which is in a sense similar to the system which had prevailed under the Soviet regime. But even for this, rouble payment is required. Upfront money is to be paid to a Russian bank which has procured rupee funds from Foreign Economic Bank of Russia known as VEB.

A great advantage for the use of DRA account is that rupee funds are offered at a discount of 20-40 per cent (known in Russian parlance as a coefficient of about 0.7 per cent which is reminiscent of the Soviet past when all foreign currencies were calculated in roubles at varying coefficients which was different from the so-called official exchange

rates reflecting shadow value of rouble). For instance, officially \$ 1 = 4,500 roubles. But a Russian firm has to deposit about 3,550 roubles for getting the equivalent of \$ 1 for importing goods from India. In other words, one can get Rs 38-41 per US dollar against official exchange rate of Rs 31.32. This difference makes imports from India profitable. But this also amounts to devaluing the Indian rupee in the Russian market. Thirty per cent discount is given if payment is made in 60 days and 20 per cent discount for 90 days.

It appears that many trading firms prefer to pay upfront money in cash since bank credit and guarantee are available at very high interest rates of 5-10 per cent per month. The payment of such high interest cuts the profit margin for the trading firm. Hence in many cases arrangements are made in advance and deals are finalised by trading firms so that letters of credit are opened by Russian importing agencies when goods are being shipped so that time for delivery is reduced and transaction completed within the stipulated period. But this involves a lot of problems and risks.

The second channel is Escrow account. India can export goods to Russia under the Escrow account funds held by a Russian enterprise or organisation which has accumulated these funds against previous exports to India. For instance, these are mainly defence-related units such as Aviaexport which supplied defence equipment to India in the past, the receipts of which were kept in Escrow account. An Escrow account may be operated in dollars or in rupees depending upon the nature of funds held by the Russian organisation. The rupee Escrow account was more prominent in the past and will be significant for some more time. But dollar Escrow account is gaining importance. The use of these funds depends upon the concerned organisations and there seems to be substantial freedom and flexibility in terms of the items to be imported into Russia or the destination of supplies, etc.

The third channel is the hard currency trade account for which there are hardly any restrictions for exports to Russia. Lastly, the unofficial or partly legal trade channel is a new phenomenon after the Soviet disintegration. This form of trade is carried out mainly by 'fly-by-night' operators from India and also by shuttlers (known as Chelnokhniks in Russian) from the Russian side.

It is interesting to note that exports of certain goods such as tea or medicines may go simultaneously through more than one route or channel by same or different agencies which adds to the complexity of trading with Russia.

There is a general opinion among the officials in Russia and India that it may not be possible to know the precise volume of Indo-Russian trade. This means that the

available data on trade may not reflect the actual volume of trade not only due to the multiplicity of trade channels including the semi-legal channel but also due to the fact that some trade may take place through non-Russian ports such as Nikolaevsk in Ukraine with the goods actually reaching Russia. According to one banking expert in Russia, the share of hard currency exports could be about 5-7 per cent while the shares of trade through debt repayment and Escrow account might be nearly equal, i.e. about 40 per cent each. The quantum of unofficial or semi-legal trade is highly uncertain and hence speculative but it is flourishing under prevailing conditions in both the countries.

As stated by one authentic source under the debt repayment account the Central Bank of Russia (CBR) releases rupee funds for imports as and when required to supplement the federal budgetary needs. Hence there is no regularity and certainty as to when and for what amount tenders will be issued. This is in contrast to the Soviet past when the amount or quantity of import was predetermined by the two governments in advance.

Moreover, there is lack of transparency in the release of rupee allocation for import of even special category goods since only designated Russian banks participate in the tender. Hence so far there is no effective and transparent mechanism for use of rupee funds. Bannerjee of Ranbaxy Lab's office in Moscow stated in this context that every Indian pharmaceutical firm is kept guessing as to which Russian organisation has got the rupee allocation from the Russian government so that upfront rouble cover is not required. The fact is that many ministries are involved — ministry of finance, ministry of health and ministry of foreign economic relations. Contacting Russian agencies with all uncertainties has become a task and hence many backdoor dealings with kickbacks etc. continue which affect healthy competition. He further observed that exports through debt repayment channel is more profitable and the volume of orders is large.

Besides this, there are other hassles affecting India's exports of specific products such as pharmaceutical items to Russia. The registration of medicines for imports into Russia takes about five-six months so far as India is concerned, whereas for the US it takes only one or two weeks. Moreover, since 1994, for medicines originating from the Asian continent (India being the main country) every lot of imports in Russia has to undergo random checking in Russian laboratories, whereas there is no need for quality checking for medicines imported from the US and even European countries are exempt from this checking. These conditions add to the cost and delays in India's exports of medicines to Russia.

Russian banks, a majority of which are single branch banks, are far from being developed and hence not able to handle various foreign trade operations. In fact, Russia's banking sector is undergoing crisis

since many of them carry out speculative and unhealthy banking practices and there is lack of strict implementation of control by the CBR. One Moscow-based Indian trading firm had deposited the money with a Russian bank for payment for imports from India. This bank was closed down due to bankruptcy in the last week of August 1995 in the wake of the Russian government policy of extending the period of 'corridor' for exchange rate of rouble to the dollar.

One of the factors that has added to the complexity in India's exports to Russia is the irrationality in certain custom and import regulations. As stated by Umapati, president of a trading firm dealing in import of Indian goods, there were instances when the Russian authorities insisted on applying revised rates of value added tax (VAT) even for the transactions which were already finalised and settled and for which shipments were already made on the basis of the then prevailing VAT rate. This affected the deal and cut down earnings. There was also a specific case in 1994 when one consignment of goods was imported from India and for which all duties and taxes including VAT were paid and they were kept in the godown in Moscow. After a few months when these goods were to be sold to a Russian organisation, it was insisted that VAT was to be paid again (despite showing the proof of payment of VAT) and if necessary an application could be made for refund. It appears that getting refund in Russia is a near impossibility.

In Russia taxes on imports are very high and tax laws and regulations are complicated and are changed very frequently. It appears that there are also several irrationalities in the prevailing tax and duty structure. For instance, it is cheaper to import readily packed tea in small packs from India ready for sale rather than import tea in bulk and get it processed and packed in Russia. This may be one of the reasons why the Tata joint venture project in tea in Russia could not take off. It was also pointed out by the representative of a Dubai-based shipping and clearing firm operating in Russia that import duties are charged in Russia on the weight of goods rather than on value of goods. Under the circumstances those who can manage to import goods by avoiding or bypassing payment of all taxes through bribery, etc. are benefited. Now there has been a realisation of these irrationalities and efforts are being made for introducing tax reforms. But this may take several months if not years.

It is ironical that although India was a major supplier of certain traditional goods such as tea to the former USSR and Indian goods were well known in Russia, the image of Indian goods has been sagging in the Russian market. As observed by an Indian trade representative in Moscow, during the last two-three years non-specialists have entered the Russian market even for specialised products such as medicines. Some of them are also 'brief-case-traders' who are

prepared to deal in any product since they do not have any long term interest in cultivating the Russian market. They join hands with unscrupulous and often fake firms in Russia for making instant and maximum profit by selling goods disregarding quality or standards. The image of India in Russia is also being damaged by 'shuttlers' from Moscow who buy cheap and substandard goods in India and sell them at high prices back in their country. Considerable damage is being done by these elements. In the interest of promoting sound commercial relation between India and Russia, there is an urgent need for undertaking effective measures by policy makers in both countries to control this damage caused to India's exports to Russia.

One of the contradictions in Indo-Russian trade is that although the Soviet Union has disintegrated, some of the former network of importing organisations of the Soviet era continue. For instance, there are about 25 organisations such as Mashinexport, Energomash, Sovelektro, Rosvneshtorg, Legprom etc. which are directly nominated by the Russian government for whom quota is given for use of debt repayment rupee resources. They however get what is known as 'tseliev dengi' (object oriented money) for importing specific goods from India. They act as specialised intermediate organisations for arranging imports and they carry names very much resembling the monopoly state agencies of the Soviet past. They however do not possess any funds themselves but can only negotiate on behalf of the final buyers in Russia. Actual funds are available with these organisations or enterprises which are required to pay upfront money to a Russian bank out of their budget funds or provide for corresponding bank guarantees. It appears that some of these intermediate organisations continue to act in a monopolistic fashion and try to get maximum cuts and kickbacks for their services which possibly increases the cost of Indian goods to the Russian buyer.

In general most of the Russian enterprises or organisations are facing financial constraints and although they may be in need of goods some of which India can offer, they are unable to provide upfront money and wait for two-three months for the delivery of goods. Therefore Indian trading firms are at times expected to provide upfront money which is an added risk and uncertainty for them to get back their payment in the final analysis.

Another major contradiction is that in the post-Soviet scenario when a large number of private firms from foreign countries such as Siemens, Panasonic, Daewoo, Philips and so on have entered the Russian market for exporting their products and for establishing joint ventures in Russia, some Indian firms which had set up their representative offices in Moscow in the past are withdrawing from Russia. It is reliably learnt that HMT has closed its office in Moscow and Tata Tea has discontinued its joint venture project for

a tea processing and packaging unit in Russia. Some of the engineering firms such as Thermax and Bharat Forge are making all efforts to survive and carry on their business in Russia against all odds. The position of relatively smaller firms dealing in garments and knitwear is no different despite the fact that they have been trading with Russia (and the former Soviet Union) for the last several years.

The seriousness of this issue lies in the fact that in the past, capacities were created in India for producing many of these products—consumer goods, machinery and equipment, pharmaceutical products and so on—for meeting the needs of the former Soviet market. At present the policy makers in both the countries do not seem to be much concerned about them. In this regard the selection of only four items for special allocation for use of debt repayment funds seems to be highly unsatisfactory. The selection seems to be based more on political considerations than on economic interests and realities in both the countries. For instance, the inclusion of tobacco has so far hardly served the purpose. In 1994-95 India's export of tobacco was only Rs 15 crore, which was just about 1.5 per cent of total exports from India to Russia. The amount of \$ 100 mn earmarked for import of medicines from India is far too low as compared to the volume of imports in the past. Despite being price-wise competitive, Indian pharmaceutical firms have to struggle hard to export to Russia due to several other constraints.

It appears that there is demand for certain items of machinery and equipment such as boilers, forging equipment, crankshafts etc. by Russian enterprises. If debt repayment rupee credits are made available to them as in the past, India's exports of such items may increase significantly for the benefit of Russian enterprises.

Hence there is need for reconsideration of the issue by the policy makers in both the countries and the solution should be based on the long-term economic interests of both the countries. One possible solution could be recasting the list for budgetary allocation by incorporating all major items which were important in the export list from India to the former Soviet Union in 1991. The Russian government should also facilitate use of rupee credits for importing goods from India by adopting a more flexible policy, for instance, by not insisting on the payment of upfront money to the CBR.

Both Indian and Russian governments have agreed to consider joint venture proposals for which part of the Rs 3,000 crore of debt repayment funds could be utilised. In this regard there is an urgent need to set up an Indo-Russian joint venture in the banking and finance sector to promote mutual trade and joint industrial ventures in both the countries. While the State Bank of India has got its office in Moscow, its activities are confined mainly to settlements and not commercial transactions. It was reported in

the Indian press that Canara Bank was to open a branch in St Petersburg. The EXIM Bank of India evinced interest in promoting India's trade with Russia and other CIS and east European countries. Serious efforts should be made jointly by some of these Indian banking institutions to set up a joint Indo-Russian bank. To build up initial capital, Indian banks should consider buying up Rs 1,000 crore per year for a period of five to seven years from the Russian government (Central Bank of Russia) out of the debt repayment rupee funds held by Russia by paying equivalent amount in dollars (or roubles) at a discount of about 40 per cent, i.e., paying Rs 45-50 per dollar. The Russian government is already offering discount of 30 per cent to traders. The Russian partner organisation in this banking joint venture could put up its contribution to the initial capital so that this bank can function on a purely commercial basis with due approval and permission of both the governments. Genuine exporters on both sides can benefit from such a banking institution. It appears Vietnam has already set up a joint venture bank in Russia with a view to promoting economic relations between the two countries. Hence this proposal seems to be viable.

In conclusion, it may be observed that India's exports to Russia seem to be picking up after a sharp decline in 1992-93. This improvement in trade performance could be partly attributed to the efforts made by governments in both the countries during the last two years.

However, there should be no room for complacency since there are many

complexities and contradictions which seem to affect the promotion of Indo-Russian trade relations on a rational basis. They are multiplicity of trade channels, lack of transparency in the release of debt repayment rupee funds through 'tenders', uncertainties and irrationalities in Russia's import regulations and tax structure, its underdeveloped banking sector, lack of specialised Indian agencies for exporting specialised products to Russia, withdrawal of established Indian firms and agencies from Moscow after the Soviet disintegration, and the activities of emerging unscrupulous elements out to make quick profits rather than cultivate the Russian market with long-term interest.

These complexities need to be resolved for further promoting trade and economic relations between India and Russia. It is necessary to reconsider the list of goods for export from India for which special allocation is being made from the debt repayment funds. There is need for introducing transparency in the release of debt repayment funds. Irrationalities in Russia's tax and duty structures may be eliminated through the proposed tax reforms. Considering the potentialities of the huge Russian market, India's leading companies should give due importance to this country for promoting trade and joint ventures. This may also help in boosting India's image in Russia. In this regard India and Russia should consider setting up a joint venture in banking and finance for promoting Indo-Russian economic relations for which a part of the debt repayment funds could be utilised.

Western Cultural Boundary of Assam

Sanjib Baruah

The idea of being a speaker (and, increasingly, a reader and writer) of one language exclusively and associating that language with national or ethnic identity is a modern phenomenon. The hard boundaries that we now like to draw, of course, leave out dialects – particularly numerous in areas like Assam. We address this difficulty by assuming that dialects are related exclusively to one or the other of the languages. The relationship between language and dialect is however more problematical than that.

IN the classic account of the Assamese language Banikanta Kakati wrote: 'It was under the patronage of kings outside the western limit of modern Assam – under the patronage of the kings of Kamatapur, 14 miles south west of Koch Bihar – that the earliest Assamese books were written.'¹ He was, of course, referring to the hospitality that the Koch king Naranarayan had extended to Assam's Vishniva saint and cultural and literary pioneer Sankardev in the 16th century. This fact raises an interesting question: 'What is – and was in the past – the western boundary of Assamese culture?'

There is, of course, significant overlap today between the cultures and dialects of western Assam and northern Bengal. Kakati noted that the spoken language of north Bengal and western Assam – of undivided Kamrup and Goalpara – was 'substantially the same as seems to form one dialect group'.² The Rajbangsi dialect – spoken in parts of Siliguri, Jalpaiguri and Koch Bihar in West Bengal, Goalpara in Assam and Rangpur in Bangladesh – has close affinity with Kamrupi.³

Despite these visible cultural similarities, the fact that some of the earliest Assamese books were written in Koch Bihar – in present day West Bengal – outside the political boundaries of modern Assam may still seem perplexing. Our surprise is partly because our conception of language and its relationship to ethnic, national and subnational identity has changed rather profoundly since those days. We now think of a language as belonging to a particular group of people, somewhat exclusively. Speakers of a language, we think, can be clearly differentiated, and can be counted and located on a map with precision. This modern habit, however, may distort our understanding of the ways of our ancestors.

A starting point for appreciating the ways of our ancestors may be the fact that in those parts of the world where generalised literacy is not taken for granted, people cannot be

said to have a language; their linguistic repertoires routinely include two or more dialects or languages. In these conditions of naturally evolved multi-lingualism, people decide which language or dialect to use, depending on the demands of an occasion. That many tribal people in Assam are at least bi-lingual and that the number of speakers of these languages have changed rather dramatically from census to census – depending on answers they give to the questions of census enumerators – illustrates my point. Multilingualism can be surmised was a fairly general condition in the world before the push for generalised literacy. The idea of being a speaker (and, increasingly, a reader and writer) of one language exclusively and associating that language with national or ethnic identity is a modern phenomenon.

It is because of this modern habit that we tend to divide the world into neatly bounded countries or provinces, with one language supposedly spoken in one area and the other in the next. Hence, the surprise about early Assamese books being written outside Assam. The hard boundaries that we now like to draw, of course, leave out dialects – particularly numerous in areas like Assam. We address this difficulty by assuming that dialects are related exclusively to one or the other of the languages. But this is hardly a foolproof solution. I am not sure that it is especially illuminating to describe Rajbangsi or Kamrupi as a dialect of Assamese or of Bengali. Linguist Suniti Kumar Chatterjee had reminded us: 'Dialects are *independent* of literary speech; as such, East Bengali dialects, North Bengali dialects (with which Assamese is to be associated) and West Bengali dialects are not only independent of one another, but also they are not – as it is popularly believed in Bengal, derived from literary Bengali – the *radhu bhasa*'.⁴

The relationship between language and dialect is more problematical than it had traditionally been assumed. The layman's

view is that languages have scripts and literatures and dialects don't. The supposed characteristics of dialects, of course, can change. Indeed, in north east India there are a number of examples of dialects acquiring scripts and literatures during this century. And if dialects can be independent of neighbouring languages, how does a particular relationship develop between a dialect and a particular language, how do speakers of a dialect decide which literary speech to adopt?

I believe that in order to answer such questions, we have to understand what is essentially a social and political process: a transition from pervasive multilingualism towards monolingualism and standardisation. This push occurred at various moments in the past in different areas, but has acquired particular momentum in modern times. And, of course, this push meets with resistance. Nevertheless, during this transition, some dialects become literary speech or language and inhabitants of a large area adopt one of the dialects that they speak. In many cases, people have to learn what is almost a new speech, one that they barely spoke earlier, as literary speech. Thus, what appears to be a language at one time may have been a dialect at an earlier time. It has been said that a language is simply the dialect of a people with an army. Because of the prestige associated with being the speech of those in power, or simply the utility of understanding the speech of people in power, a dialect of certain strategic areas – perhaps a place where a royal court is located and/or is a centre of high culture – becomes accepted as standard.

The advent of the printed book, the emergence of mass literacy, the growth of the modern state that makes relentless use of the written word and seeks direct communication with citizens or even with imperial subjects as in the case of colonial states of recent times, and the rise of nationalism are among the factors that have given this push toward standardisation unprecedented momentum in modern times. Pre-literate peoples who managed fine with a repertoire of dialects and languages, switching between them, now have to make decisions that would prove profoundly transformative. Decisions on the language to be used in schools – modern schools based on a philosophy of universal education – the language of official business or the language of newspapers and early books and pamphlets that become available in an area after the printing press appears on the scene, put historically multilingual areas on the road to linguistic standardisation. This process

can be a highly contested one under some conditions – what script should a hitherto unwritten language adopt and what should be the language of education or official business not surprisingly figure prominently in the demands of some of the tribal movements in Assam

In Sankardev's time I would hypothesise, there was no hard cultural boundary between the adjacent Ahom and Koch kingdoms. While the people of these contiguous kingdoms spoke numerous languages and dialects there were shared conventions on what language or combination of languages to use say for literary spiritual or diplomatic discourse – and those conventions were probably rather context specific. The Koch court that gave patronage to Sankardev was at that time the centre of a thriving independent political formation that encompassed western Assam and northern Bengal. After the death of Sankardev's host, king Naranarayin the Koch kingdom was partitioned into Koch Bihar and Koch Hajo or Kamrup. The western portion included Koch Bihar and parts of Dinajpur Jalpaiguri and Rangpur and the eastern portion known as Koch Hajo or Kamrup was spread from the east of the Sankosh river up to Bar Nadi. Koch Hajo or Kamrup consisted mostly of the present day Assamese (undivided) districts of Goalpara Barpeta Kamrup and Darrang.

After the division the two parts followed somewhat different historical paths. Koch Bihar's history became more closely tied to the Mughals and to Bengal and Kamrup's history came to be tied to Assam. However this did not happen overnight – in the 17th century things went back and forth for a while. Nevertheless when in 1826 the Ahom kingdom became part of British India, Koch Bihar was already a part of the empire indeed even major parts of contemporary Assam's border district of Goalpara (undivided) became part of the British empire well before the rest of Assam. Thus, during the Burmese invasion of Assam that eventually brought the British to Assam the Ahom aristocracy could flee and seek refuge in what was then British Goalpara.

The partition of the Koch kingdom provedateful to the linguistic and cultural development of the two areas. When in the early 19th century Bengali national identity was being formed the novel idea of a matribhasha (mother tongue) came to be widely accepted. As Ranajit Guha describes, a new assumption entered the scene that Bengali was 'the natural language of the Bengali people' and it was "made into an ideological marker by which the literate part

of the population identified all native speakers as constituting a nation and distinguished them from their English-speaking rulers' 'However, 'natural language', 'the Bengali people' and 'native speakers', it deserves to be emphasised were all rather new concepts, even though they soon became part of our common sense. It was during this process it can be surmised the speakers of various dialects of Koch Bihar became 'Bengalis'. The reasons were entirely contingent and not any natural relationship between those dialects and Bengali. The developments in Koch Hajo or Kamrup were more ambiguous. While Kamrupi and Goalpara speakers adopted Assamese as their literary speech – not without some hesitation in the latter case – there has been growing resistance in recent years to adopting Assamese on the part of the speakers of many tribal dialects. The Bodo movement in Assam, whose base is western Assam articulates an aspiration of differentiation and autonomy vis a vis Assamese while the Bodos of north Bengal by and large have not expressed a similar will vis a vis Bengali. This in some ways is the legacy of the partition of the Koch kingdom and the differential capacity of Calcutta based literary Bengali and of Sibsagar based literary Assamese to absorb

speeches within their spheres of influence. There was nothing inevitable about the particular course that history took. It may be fruitful to imagine various counter-factual scenarios. For instance, had the Koch kingdom managed to reconstitute itself as a political-cultural centre, we would have by now become just as used to a third cultural formation between Bengal and Assam.

Concept

URBAN REDEVELOPMENT

A Study of High-Rise Buildings

K. Narayan Reddy

Foreword by Prof. N. Balakrishna Reddy

Hardbound

Rs 350

The book makes a detailed analysis of the high-rise buildings with a view to understand the use of high-rise space both for residential and commercial use and also its impact on urban environment. An attempt has also been made to highlight the socio-economic implications of the high-rise growth. This will have relevance to most of the developing countries where conditions are very much similar. The book explores the redevelopment process and rightly relates it with the city's vertical growth.

Dr. K. Narayan Reddy is presently at Department of Geography, Osmania University, Hyderabad

Dumont or Not Dumont

The Anthropological Follies

David S Philip

Contestations between modern-day anthropologists reflect power relation between the east and the west, giving credence to the hierarchic notion of man

To assert himself and exert his authority everyone tries to bring out in the sciences something new which often consists merely in his overthrowing what was hitherto regarded correct in order to put in its place his own stuff and humbug. Occasionally this succeeds for a time and then a return is made to the old and correct theory. Those modern writers are not serious about anything in the world except their own precious persons: it is this that they wish to assert.

—Schopenhauer

THIS year marks the silver anniversary of the English publication of what is arguably the single most significant scholarly study of Indian society by a western author in this century. Even today, Louis Dumont's *Homo Hierarchicus* is capable of generating as much heated academic debate as when it first rolled off the presses. And love it or hate it, it remains a work that no serious student of Indian society can choose to ignore.

Wisely, Dumont has seldom seen fit to dignify his critics with a response. Instead he has, as promised, continued to construct the grand sociological edifice for which Indian society provided the initial inspiration. This is evident even in his most recent *The German Ideology*, a collection of mostly previously published papers on the differences between French and German societies. As it stands, the Dumontian worldview posits Indian society as a living example of a traditional hierarchic society, the obverse of the modern egalitarian democracies of the west. The Indian status hierarchy of caste is founded on the indigenous distinction between purity and impurity and there is a radical disjunction between status and power as respectively represented by the brahman and kshatriya. Such, in brief, is the Dumontian position. It is, however, not our purpose to support or contradict these arguments on their merits or lack of them but rather to show how the very response to Dumont's ideas substantiates the premise of hierarchy in an unexpected fashion.

Dumont's most vocal opposition has come from precisely that quarter one could expect. McKim Marriott, professor of anthropology at the University of Chicago, an institution which established a well deserved reputation for excellence in south Asian studies in the

1950s and 1960s. In an exhaustive review of the French edition of *Homo Hierarchicus* published in a 1969 issue of *The American Anthropologist*, Marriott meticulously attempts to deny every facet of Dumont's argument, finally dismissing it as little more than an intellectual exercise. In the 1970s, Marriott went on to construct the main rival to Dumont's ideas in the shape of what has become known as Chicago 'jati' theory. Again, this is not the place to either endorse or refute Marriott's 'ethnoscology'. Let us just cite the opinion of one of Marriott's students who was, as it were, present at the creation. Rutgers University professor of anthropology Michael Molfett, writes in a 1990 *Contributions to Indian Sociology* article that Marriott's ideas were formed 'in response to the challenge presented by Louis Dumont's grand theory of Indian civilisation'. Further on, he expressly states,

Marriott's theory was set up *contra* Dumont.

The formulation of another Chicago alumnus, University of Minnesota professor of anthropology Gloria Goodwin Raheja betrays a similar inspiration. Raheja's recently published *The Poison in the Gift* valiantly struggles to offer a systematic alternative to the Dumontian *idée maitresse*. Briefly, she maintains that caste is founded on something called ritual centrality. Indigenous notions of auspiciousness are more important than purity/impurity in daily inter-caste transactions which have more to do with mutuality than hierarchy. Indeed, at one point she declares that she could find no evidence of hierarchic inter-caste relations in the north Indian village of Pahansu she studied. Here, of course, we come full circle to the integrative functions of caste long ago noticed by other scholars like the Wisers.

But as tightly argued and persuasive as Raheja's thesis may at first appear, we must pinch ourselves and ask a simple question: can caste really be about equality? What, one wonders, would the victims of the Tsundur massacre have to say about Raheja's mutuality?

This is the worst kind of academic wheel-spinning. But the real motive for Raheja's theory, which has so far failed to make the big impression its author so clearly intended, is not far to seek. Jonathan Parry of the

London School of Economics discerns in Raheja's distinction between sin and impurity 'an artefact of the requirements of an anti-Dumontian polemic'. Likewise, Akos Ostor and Lina Iruzetti have written that 'Raheja seems to construct her work around an explicit refutation of Dumont's principle of hierarchy'. Simply put, the Dumontian thesis of hierarchy and no less importantly, its controversial success determines Raheja's antithesis of equality and mutuality. If Dumont says apples Raheja will say oranges, even though as it is well known Dumont makes allowance for the co-operative aspects of caste through the principle of complementarity. He also recognises a real measure of equality between members of the same caste.

It is indeed difficult to understand the amount of attention given to Dumont's ideas (symposiums for instance in *The Journal of Asian Studies* and *Current Anthropology*) without taking account of the principle of hierarchy itself. As early as 670 AD, for instance, the Chinese pilgrim Hsüan Tsang noted the Hindu emphasis on purity and its opposite.

Now the first and chief difference between India of the five regions and other nations is the peculiar distinction between purity and impurity.

Dumont's French predecessor Bouglé repeatedly mentions the principle of hierarchy in his discussion of caste. Why then the fuss about Dumont? The situation resembles the cult of academic celebrity built around another thinker whose work has had profound implications for the study of Indian society. Edward Said. Much of Said's critique of *Orientalism* can be found in the earlier work of the Egyptian scholar Anwar Abdel Malek but with the publication of Said's *Orientalism* all mention of this academic trailblazer vanished in the rush to put Said on a pedestal.

Dumont himself has complained at length about precisely this kind of response to his work and of the enervating effects of intellectual one-upmanship like the kind practised by Raheja on the anthropological enterprise. Ironically, Dumont says his ideas have been the victim of the very individualism which his work posits as a defining characteristic of western societies in contrast to India's corporate orientation. In an interview with Jean-Claude Calley, he remarks:

I have suffered under the paradoxical situation that my work when it was felt to be original or challenging was interpreted to be 'personal' or personally oriented while in actual fact it was essentially oriented to the assumed community of researchers to a degree that made it anachronistic in our very individual-oriented world. I was given to understand along two decades that my

work would finally attain some recognition, not as it was intended as a contribution to the collective construction of a theory or system but willy nilly as a 'personal' contribution. This is the rub: the conditions in which our craft is practised are such that one is compelled to retreat from the collective orientation that is that of science, to the more personal orientation of the philosopher, writer or artist, to admit that the products of the craft are not cumulative: that the scientific community hardly exists at all or at any rate to recoil upon oneself and choose one's subject matter accordingly.

As a consequence, instead of an ordered progress in which everyone would have a place, we witness individual successes or failures and a chronic instability in the major interest or interests of the profession.

As Karl Popper once complained, the social sciences are really total ideologies, or putting it differently, some social scientists are unable and ever unwilling to speak a common language.

Let's face facts. Anthropology, that is, social scientific writing of foreign authorship on India, long ago exhausted its practical *raison d'être*. There are no strange customs to catalogue and no issues of substance to resolve. But it would be asking too much of human nature to expect anthropologists themselves to disassemble the system of status and prestige, the sabbaticals and tenured chairs that they've constructed. After all, why pluck the feathers of the goose that laid the golden egg? Instead, now all is opinion and wrangling without end. The continuing controversy surrounding Dumont's work is hardly an isolated case. Witness the current contretemps, exposed for all to see in a recent issue of *The New York Times Magazine*, between the doyenne of American cultural anthropology, Clifford Geertz, and the man who would be king, City University of New York professor of anthropology, Vincent Crapanzano.

Marriott's eminent Chicago colleague, Marshall Sahlins, has been engaged in a similar undignified exercise in academic shin-kicking with Princeton University anthropologist Gananath Obeyesekere, carried on in part on the pages of *The Times Literary Supplement*.

What does all this tell us about the nature of man, which is properly anthropology's subject? Here we see a strange kind of congruence between anthropology and the institution of caste itself. Dumont makes the case clear in an appendix to *Homo Hierarchicus*.

Hierarchy is a universal necessity: it will become manifest in some way, in covert, ignominious or pathological forms, in relation to the opposed ideals in force.

The dichotomy between man in India as hierarchic and man in western society as egalitarian falls by the wayside. Man, as we hardly need to be told, is everywhere.

hierarchic and characterised by the will to dominate. Needless to say, this conclusion can be adduced from the behaviour of anthropologists themselves.

What other conclusion can intelligent minds reach than that the entire project of anthropologising India is riddled with a large amount of cultural condescension to Indian beliefs and institutions? What's more, the practice of anthropology itself is evidence of a continuing relation of power between India and the west. As the literary critic George Steiner once cautioned:

The notion of travelling to far places in order to study alien peoples and cultures is unique to western man: no primitive peoples have ever come to study us. The western obsession with inquiry, with analysis, is itself a mode of subjugation and technical mastery.

In recent years, anthropology has sought a way around this unpalatable truth by

inducting so-called native anthropologists into its ranks. These mostly well-born Indians travel to the west to obtain doctorates in anthropology. Then, as is currently the fashion, sententiously denounce the evils of colonialism and orientalism. If the welfare of India and Indians is their real concern, why are these persons not in India, where their talents might make a difference? The answer is obvious: India no longer provides sufficient scope for their gargantuan social aspirations. They will have their cake and eat it too, trading on their supposed insider's knowledge of India in the west and basking in the deference paid to foreign academics when they deign to visit India. One of whom we speak, Arjun Appadurai, now himself a Chicago professor of anthropology, once wrote a review of Dumont's ideas entitled 'Is Homo Hierarchicus?' If he is not, why bother asking?

'Encounter' Killings in Andhra Pradesh

P Srikrishna Deva Rao

The strong nexus between the police and the state government continues to deny justice to the victims of faked encounters in Andhra Pradesh

Though footsteps may touch this spot for a thousand years, they will not erase the blood of those who here have fallen. And the hour that you fell will not be extinguished through thousand of years cross this silence.

—Pablo Neruda

THREE years ago Narasamma, the mother of an encounter victim, Shankaraiah, lost her eyesight when the police beat her on the head. Her crime: deposing the facts about her son's death before the subdivisional magistrate Nagarkurnool of Andhra Pradesh during the enquiry into an alleged encounter death. Recently, she re-narrated the facts before the National Human Rights Commission (NHRC) which is currently probing into encounter deaths in Andhra Pradesh.

To date the police who murdered Shankaraiah and who beat Narasamma are still free but there may be justice on the horizon. Last month the NHRC began a hearing into six encounter deaths in Andhra Pradesh. The hearing, which began on August 21, 1995 on the basis of a complaint filed by Andhra Pradesh Civil Liberties Committee (APCLC), will examine six out of 492 alleged encounters between police and suspected naxalite activists between 1991 and 1993. The final hearing is to be held on September 21, 1995.

Narasamma is one of those hundreds of mothers whose children have been killed or disappeared in state-sponsored terrorism in Andhra Pradesh for the last two and-a-half decades. She has seen the torturers, kidnappers and assassins escape punishment and reap rewards for their actions in the form of promotions. Narasamma is not seeking revenge for her son's death and her blindness; she simply wants those responsible for these and other crimes to be punished. Narasamma's case is not an isolated incident. In fact it is just the tip of the iceberg. Hundreds of political activists have been killed while in state custody. Thousands have emerged from detention physically and psychologically maimed.

ENCOUNTER DEATHS AND LEGAL VACUUM

Extrajudicial executions in Andhra Pradesh date back to the days of the Telangana peasants' struggle of the late 1940s. At least 2,500 people were shot dead in the name of 'police action' under the cover of the Madras Suppression of Disturbances Act,

1948. It is also the first major deployment of the army to suppress a political movement in India.

Though there has been a long history of brutal state repression since the birth of the Indian nation, the term 'encounter death' officially entered the human rights vocabulary in the late 1960s. In UN parlance it means extrajudicial execution. In the colloquial language an encounter is essentially an armed confrontation during which an exchange of fire takes place and suspected insurgents are killed. Fair and square. Or is it? The hallmark of an encounter death is that it is a stage-managed extermination of an individual or a group by brutal means. Victims are often tortured by the police, shot and then dumped at the alleged site of the encounter. The police routinely circulate stories of 'armed encounters' between suspected insurgents and the police, during which the police say they fired in self defence.

The killing of political activists began in earnest in the late 1960s with the emergence of the naxalite movement. The movement was born in the district of Naxalbari in West Bengal. The naxalite struggle raised the issue of land rights, labour rights and challenged the existing political and economic structures. The movement spread from the land of its origin to Srikakulam, the tribal belt of Andhra Pradesh and found fertile ground in the plains of central India, where generations of oppressed agricultural workers had been living under the feudal control of the landowners.

Promised land reforms never came into effect. Instead local politicians in league with the police responded with an iron hand to eliminate activists and supporters of the movement in so-called 'encounters'. More than 1,300 people have been killed in encounters in Andhra Pradesh since 1968. Not one member of the police force or any other security force has been questioned, let alone convicted. In the first half of the 1990s there have been 605 encounter deaths, three times the number recorded by the APCLC in the 1970s or the 1980s.

The largest encounter took place in January 1992 during which 13 naxalites were killed while travelling through the Khammam forest of Andhra Pradesh. The police stopped their van and shot all 13 passengers. The latest

addition to the list is of Madhusudhan Raj who was killed in the heart of Hyderabad city on the night of July 26. Madhusudhan Raj, a mechanical engineer, is the secretary of the state committee of Communist Party of India (Marxist and Leninist) led by Phani Bagchi and was also the general secretary of state committee of Indian Federation of Trade Unions from 1978 to 1987. The blood stains, broken teeth and glasses, the bullet marks on the doors and walls are the living testimony of another encounter death.

In every case the police version of the incident is identical. The police generally states, 'on receiving information about the movements of naxalites, the police party took up combing operations. During the combing operations the police encountered the naxalites and opened fire in self defence in which an unidentified naxalite was killed.'

What the law says and what actually happens are two very different scenarios. Section 176 of the Criminal Procedure Code makes it mandatory for the executive magistrate to conduct the enquiry into all the extrajudicial executions. It is also the mandatory that police inform the concerned district or sub-divisional magistrate and his superior officials of the encounter.

The sordid story is that the police do not even file a first information report after an alleged encounter, making it easy to bury the evidence later on. No investigations are conducted into the encounter or if conducted they are done by the same policemen who were involved in the incident. No account of the ammunition used during the encounter is maintained. No proper post mortem examinations are done. There have been reports that the doctor is forced to conduct the post mortem examination at the site of the alleged encounter away from the facilities of the laboratory. The police are known to dictate the contents of the inquest and post-mortem reports. Because these reports are privileged documents, they are not available to the public.

The police's failure to investigate extrajudicial executions is a major obstacle to justice in the state. The law regarding the investigation and prosecution of extrajudicial executions is silent on many key points, leaving it open to interpretation. The failure to conduct adequate investigations into alleged encounters as well as the failure to prosecute suspects has effectively condoned the actions of the police and contributed to the escalation of violence in Andhra Pradesh.

INTERNATIONAL STANDARDS AND BHARGAVA COMMISSION

Recognising the legal vacuum that exists in many countries, the UN and the international community expressed its concern at the occurrence of the extrajudicial

executions. On December 15, 1980 the UN general assembly adopted a specific resolution on arbitrary and summary executions. The UN general assembly, bearing in mind the results of the Sixth United Nations Congress on the Prevention of Crime and Treatment of Offenders, condemned the practice of summary and arbitrary executions in 1981, and in 1982 a Special Rapporteur on Summary and Arbitrary Executions was appointed by the Economic and Social Council.

The UN and the international community began to formulate a set of principles and medico-legal standards for investigation and prevention of extra-legal, arbitrary and summary executions. The work dates back to the beginning of the 1980s and resulted in the preparation of Principles on the Effective Prevention and Investigation of Extra-Legal and Arbitrary and Summary Executions. The principles were adopted by the Economic and Social Council and endorsed by the UN general assembly in December 1989. To supplement the Principles, the Minnesota Lawyers International Human Rights Committee prepared a manual in 1991 for thorough, prompt and impartial investigation of all suspected cases of extra-legal, arbitrary and summary executions. It is meant to explain the unexplained deaths and to help in identifying the perpetrator to be tried by a competent court of law by increasing confidence in the rule of law. But the principles have not been adopted so far by many countries in the world including India.

The first incident of police killings in Andhra Pradesh in post-independence was reported on March 3, 1968 at Pedakharja in Srikulam. The police, in league with goons of the landlord, fired on two tribals. The stories of encounter deaths began proliferating on the front pages of the newspapers in 1969 with the murders of Panchadi Krishna Murthy in May 1969 and Subbarao Panigrahi in December 1969. It reached its peak during the emergency when all fundamental rights, including the right to life, were denied.

Since the 1970s, the killing of political activists in the name of encounters had become the *modus operandi* of murder in cold blood by the police. The declaration of the emergency on June 26, 1975 was the official licence to the police to systematically liquidate the political dissenters. Jayaprakash Narayan, as the president of the Citizens' Committee for Democracy set up a committee in April 1977 headed by V M Tarkunde to investigate into the deaths. The civil rights committee headed by Tarkunde investigated the matter and demanded the central government to appoint a judicial commission. The central government appointed the Bhargava Commission after

the emergency in June 1977 to investigate into the deaths of naxalites during 1968-77.

The Bhargava Commission began its investigations in August 1977 and its term was extended in December 1977 for six more months. The commission could not complete its work due to the non co-operation of the state government which had intimidated the witnesses, refused to produce relevant documents and finally decided the proceedings of the commission behind closed doors. The Bhargava Commission's term expired and the state government chose not to extend it. In the end the commission never got around to submitting a preliminary report. The fate of the Bhargava Commission proves that a state government can easily thwart the activities of an unwanted official investigation.

The killings in Andhra Pradesh continued more vigorously after the emergency. The encounters were revived in 1980 after a short reprieve of three years. Some parts of Telangana were declared 'disturbed area' and the killings resumed under the cover of the National Security Act.

JUDICIAL ESCAPISM

Encouraged by the post-emergency judicial activism of the Supreme Court, the APCLC made another attempt to seek justice. It knocked at the door of the Supreme Court, the supposed 'protector and guarantor of fundamental rights'. The scene had shifted to the arena of court halls.

The APCLC filed a writ petition in the Supreme Court in 1982 requesting that the court set up an independent enquiry to investigate encounter killings between 1980 and 1981. Over the next four years the committee approached the Supreme Court with fresh affidavits concerning further encounter killings. The court admitted the petition in September 1985 but threw it out in April 1989, along with another two petitions on the alleged extrajudicial executions in Tamil Nadu and Uttar Pradesh.

The Supreme Court gave a remarkable piece of advice: "aggrieved parties, if any, should file private complaints before the local magistrates against the police." Thus, the Supreme Court abdicated its duty to enforce the fundamental rights and acted as the enforcer of the Criminal Procedure Code rather than the Constitution. In 1989 the Supreme Court's further advised the APCLC to submit a memorandum to the state of Andhra Pradesh and directed the government to report to the court about the action taken. Pursuant to the Supreme Court's order, the APCLC submitted a detailed list of all the encounter killings in Andhra Pradesh after the lifting of the emergency. The petition of APCLC has been pending before the AP state government since 1989.

The brazenness of the killings perceptibly increased after the Supreme Court dismissed the petition on encounter killings. The encounter killings, which had earlier been confined to deep forests, now shifted to the town: to high school grounds, deserted temples, empty water tanks and drainage canals.

The APCLC did not lose hope but continued to struggle for justice for the victims of encounter killings. This time using the 'democratic space' of the National Human Rights Commission. The APCLC filed the complaint in March 1994 on the 496 encounter killings in the state during 1991-93. The NHRC took note of 74 encounter deaths listed in the complaint and sought a response from the government of Andhra Pradesh. The NHRC also visited the state in August 1994 to gather information from a cross section of citizens. The police attempted to sidetrack the proceedings of the commission's investigation in Andhra Pradesh. During the commission's official visit the police intimidated and terrorised anyone who tried to denounce police violence. The Andhra police were determined to sabotage the NHRC's fact finding tour. Even the state government would not co-operate with the NHRC enquiry.

It is in this context that the present hearing of the NHRC, due to wrap up on September 21, assumes significance. Let us redeem the hope of justice for the unforgotten victims of state violence in Andhra Pradesh. Let us hope that the NHRC enquiry will shed light on the facts and uphold the value of human life which has, so far, been dismissed by the state.

Why Devaluation Won't Help

S Akbar Zaidi

Devaluation will push up inflation, already high without necessarily improving the balance of trade. The real obstacle to higher exports today is not the rupee/dollar parity, but the anarchic political situation in Karachi

BUSINESS and banking circles are abuzz with the prospects of an imminent devaluation. Exporters and importers are hedging their bets as they believe that the government of Pakistan is about to devalue the rupee substantially. Leading currency analysts in the city are predicting a massive devaluation of the rupee against the US dollar before the end of the year. These devaluation rumours have been sweeping across the market for many weeks and have been intensified recently resulting in a near panic buying of dollars along with a sharp increase in imports as the importers want to capitalise on the higher existing exchange rate before imported items become more expensive. Even federal commerce minister Chaudhry Ahmed Mukhtar joined in the foray a few days ago and revealed that the government intends to devalue the rupee by 3 per cent by the end of the year. In all this ruckus the only institution which has consistently taken a different stance is in fact the institution which is actually supposed to announce changes in the value of the rupee: the State Bank of Pakistan.

Governor of State Bank Yaqub has repeatedly and strongly denied all the rumours and speculations about devaluation massive or otherwise. From statements attributed to the governor which range from no devaluation in the offing and that he has ruled out devaluation to the stronger dismissal of the commerce minister's statement on devaluation since the beginning of the current fiscal year on July 1, the governor of the State Bank has consistently held on to his claim that devaluation will not take place. Furthermore, he has warned

those involved in 'gambling' on a probable devaluation of the rupee to do so at their own risk and has reminded them of a similar warning issued to them by him at the time the government had decided to make the rupee convertible in June 1994. The currency analysts and market players at that time as today were expecting a massive downward movement in the rupee and again as today had indulged in a pre 1994 budget buying spree to make windfall profits. However, the rupee depreciated and adjusted by only 9.3 per cent after the partial convertibility on July 1, 1994. Despite the claims and warnings by the governor that no devaluation is in sight, however, the rupee since the budget was announced on June 14 has seen as many as nine downward adjustments.

The spot buying rate of the rupee was pegged to the US dollar at Rs 30.97 prior to the budget. The first post budget downward movement occurred on June 28

when it lost 4 paise and settled at Rs 31.01. In the 14 week since the mid-June budget to the end of September, the nine downward adjustments have resulted in a depreciation of the value of the rupee by 58 paise (down by 1.87 per cent) and at the end of September the spot buying rate of the rupee with respect to the dollar was Rs 31.55. The governor of the State Bank has called this drop a corrective adjustment and not a devaluation.

Bankers and currency analysts have forecast substantial devaluation before the year ends and their prediction ranges from a December rupee/dollar parity of a very minimum Rs 32 to the dollar but with rate closer to the Rs 33 mark. One analyst believes that the most real value for the rupee before the year is out is a massive Rs 35 to one US dollar. A senior banker in a leading US bank says that his bank feels that the rupee will depreciate by 10-15 per cent by early November. This means that this bank is advising its clients that the dollar would be worth Rs 36.2 in a few weeks well before the end of the year.

Most analysts have given four reasons for the impending devaluation, three of which relate to what are called fundamentals. They believe that there is need for devaluation due to the continued widening of the trade gap, the fall in foreign exchange reserves and the mounting inflationary pressures. The fourth reason is said to be the recent adjustment/devaluation of the Indian rupee. Let us examine some of these claims.

TABLE 2 RECENT TRENDS IN THE RUPEE/DOLLAR RATE

	Jun 6 1994	Jan 5 1995	June 14 1995 (1995-96 Budget)	July 1 1995 (Fiscal Year 1995-96 begins)	Sept 30 1995
Rupees to one dollar	30.19	30.80	30.97	31.01	31.55
Change in paise		61	17	4	54
Per cent change Jan 6 1994 to Jan 5 1995		2.02			
Per cent change July 1 1995 to Sept 30 1995					1.87
Per cent change Jan 5 1995 to Sept 30 1995					2.43

TABLE 1 VALUE AND DEPRECIATION OF PAKISTANI RUPEE IN TERMS OF US DOLLAR

	April 1972	May 1972	February 1973	1981 82	1982 83	1983 84	1984 85	1985 86	1986 87	1987 88	1988 89	1989 90	1990 91	1991 92	1992 93	1993 94	1994 95	1995 96
Rupees to one dollar	4.76	11.00	9.90	9.90	10.10	13.08	14.74	16.00	16.26	17.39	17.99	20.90	21.90	24.36	25.08	27.07	30.73	31.05
Per cent change each year	-	-	-	-	2.02	29.50	12.69	8.55	1.63	6.95	3.45	16.18	4.78	11.23	2.96	7.93	13.52	1.04
Per cent change since 1982 when the man- aged float began	-	-	-	-	2.02	32.12	48.89	61.62	64.24	75.66	81.72	111.11	121.21	146.06	153.33	173.43	210.40	213.64

Note: The rupee rate is the average for the year.

The trade and current account deficits have both been falling over the last few years, not widening. The trade deficit in the last financial year 1994-95 as a percentage of GDP was the lowest since 1980. The current account deficit (as a percentage of GDP) for the last year was the lowest since 1987 with the exception of 1991-92. Hence the trend for the two deficits which are very closely related to the exchange rate has been falling. On the other hand, foreign exchange reserves have been rising consistently since 1990, and at the end of the last financial year were \$2.74 billion, the highest ever. On two counts which reveal important trends related to the exchange rate, currency analysts have got the direction of the movement wrong.

Inflation is the only fundamental on which the analysts are right but for the wrong reasons. Inflation has been on the rise and has affected what is known as the real exchange rate which compares the inflation rate in exporting and importing countries. A high inflation in one trading country vis-à-vis the other implies a deteriorating real exchange rate and hence the need to devalue the nominal exchange rate to make our goods more competitive. It is true that Pakistan's inflation rate is higher than its trading partners, but a devaluation on these grounds would only add fuel to fire. Devaluation for Pakistan would prove to be inflationary and worsen further an already explosive price situation.

The main reason given in favour of devaluation is that it will make exports more competitive, i.e. cheaper and hence increase the volume of exports and foreign exchange earnings. However, even at a theoretical level this is a questionable proposition. Firstly, exports may not be price sensitive and they may respond to non-price factors, and thus lowering the price of exports may not affect volume and increase demand – this phenomenon was observed in Pakistan after Moeen Quraishi's devaluation two years ago. There is often a J curve effect seen where the balance of trade (the value of exports minus the value of imports), first deteriorates before any improvement is seen – this often sees the knee jerk reaction of further devaluation and adds further problems. Also if exports do indeed increase the price of imports also rises and under numerous conditions the effect of a devaluation may substantially worsen the balance of trade and negate the entire exercise. Furthermore, after the utter devastation of the Mexican economy following a bungled devaluation nine months ago, foreign investors have become a little bit more cautious about such interventions in emerging markets, and local governments are aware of these concerns.

The fourth reason why Pakistan should devalue is the weakest. The argument doing the rounds suggests that since the value of the Indian rupee has fallen, i.e. depreciated,

Pakistan must devalue immediately. Newspaper articles are clamouring that the "Indian move is an economic invasion to knock out Pakistani exports in the world market." There are numerous inconsistencies in this claim.

Firstly, Indian goods are not strictly comparable to Pakistani exports and nor are all of them perfect substitutes. Secondly, export orders and contracts are usually signed well in advance and are based on numerous non-price considerations which include political factors, long term dealings, practices and ties, institutional factors, tradition and cultural factors and a host of others. Thirdly, Indian exports generate almost four times the foreign exchange that Pakistani exports are able to bring, implying that the Indian market is already well established compared to Pakistan's. Fourthly, the devaluation seen in the Indian rupee was in the korb market where the rupee fell to Rs 35 per US dollar for a short while but then stabilised at around 33.80. The official Indian rupee was not changed. Finally, Indian exports have seen a surge this year where they have risen by 29 per cent since April compared to last year. A very healthy trend indeed. Essentially then, a devaluation in the Indian rupee by a few percentage points should not cause concern to our exporters. What matters for us is the US dollar.

Strangely enough, while all currency analysts and traders have been giving arguments for devaluation, they have not given enough weight to what happens to the US dollar. Pakistan follows a managed float and although there is a basket of currencies to which the rupee is linked, the US dollar is the key currency for the rupee. The dollar

fell to an all-time low of one dollar to 1 Japanese yen this April, and after a 15-month high is now around 100 yen. The US dollar started its upward movement in July and the changes in the dollar/Pakistan rupee rate need to be seen in that context. A stronger US dollar would put pressure on the Pakistani rupee and hence the need for the 'technical adjustments'. The key determinant in the next few months for the Pakistani rupee will be the value of the US dollar, not the Indian rupee. Once the dollar stabilises, so should the rupee. Furthermore, as the Tables show so far this year there has been very little adjustment, mainly because the dollar was weaker and based on past trends there is considerable room to manoeuvre.

At the moment, the government's most immediate task is to deal with rising inflation which was 14.8 per cent in August or a year on year basis. Devaluation would only increase that inflation without necessarily improving the balance of trade position. Exports have shown a healthy trend last year, growing by 15.7 per cent, with a value of \$7.8 billion. The target for the current fiscal year 1995-96 is \$9.2 billion, and if the cotton crop is good, it is very probable one can expect an increase in exports. The stumbling block for high exports is not the rupee/dollar parity rate but the anarchic and devastating political situation in Karachi. All attempts at improving the economy and expanding exports must be predicated on finding a quick and just solution to the politics of Karachi. The business community should be pressurising the government to come to terms with the concerns of the people of this city. In comparison, devaluation is a trivial issue.

CALL FOR PAPERS

Unpublished papers, in the nature of an encyclopaedic contribution, are invited for inclusion in a multi-volume series being edited by Professor S. Bhagwan Dahiya on **Liberalisation, Globalisation and Adjustment Programmes: Theory and Practice**. The scope of this work includes the following aspects:

- 1 The role of Economic, Social and Political forces in driving and shaping globalisation and regionalisation, and their interaction
- 2 The relationship between globalisation and regionalisation
- 3 The implications of globalisation and regionalisation for developing countries
- 4 The economic, social and political dimensions of liberalisation, globalisation and adjustment programme
- 5 The process of interactions between interest groups and government decision-making during the successive phases of adjustment

LAST DATE FOR SUBMISSION OF MANUSCRIPTS, PREFERABLY ON FLOPPY DISK: 30 NOVEMBER 1995

This series will be published by the **Spell Bound Publications Pvt. Ltd., Rohtak**

Papers should be sent to

Professor S. Bhagwan Dahiya
F-2, University Campus
Rohtak-124 001 [INDIA]

Sudan: Opposition's Agenda

Ninan Koshy

The Sudanese regime will attempt to exploit the weak points in the consensus of the opposition parties. But it cannot afford to ignore their newly attained strength. The government's chief advantage seems to be the increasing complexity of the situation in the South compounded by lack of unity and cohesiveness among the Southern movements.

THE emergence of a consensus among major opposition forces in Sudan on self-determination as the key to peace has posed a serious challenge to the National Islamic Front regime. While the leadership given by the former prime minister Sadiq al-Mahdi in championing the right to self-determination and building the consensus annoyed the government and led to his fifth detention since 1989 – when the military overthrew his democratically elected government – his release at the end of August indicates the narrowing of options for the government. While there has been international pressure to release Sadiq al-Mahdi, the government is keen to see whether the consensus among the opposition parties on self-determination can be broken.

Four days after the arrest of Sadiq al-Mahdi in mid May, the government stated that the former prime minister had been arrested for his part in the agreement at Chukkudum in South Sudan in December 1994, between his Umma Party and the Sudan People's Liberation Army (SPLA). While in detention the government could add another reason, viz, that of authorising his party to sign the National Democratic Alliance Agreement in Asmara, Eritrea. If the Chukkudum agreement was only between the Umma Party and the SPLA, the Asmara agreement was among a broad alliance of Sudanese parties and movements which can claim to represent the vast majority of the people of Sudan. Together these agreements constitute the most important development in Sudanese opposition in the last six years.

Sadiq al-Mahdi's arrest came six months after the Chukkudum agreement, the alleged reason for his detention. What apparently provoked the government was a scathing attack the former prime minister made on the policies of the regime at the Ansar Mosque in Wad Nubawi, Omdurman, on the occasion of Eid El Adha, the pilgrimage feast on May 10. Pointing out that the regime's policies had been a miserable failure and were full of contradictions, he predicted the imminent fall of the government.

In fact al-Mahdi was building on criticisms he had made at the end of Ramadan in March. In that he endorsed strongly the right

of the people of South Sudan to self-determination upheld in the agreement at Chukkudum. In a wide-ranging political speech Sadiq al-Mahdi said that the Southern Sudanese should decide in a free and fair referendum whether to remain part of a united Sudan or become independent. If the people of the South voted for independence he could see no sense in trying to maintain unity by force.

Sadiq al-Mahdi has often used religious occasions to make important declarations on political issues. This is true of many Sudanese political leaders. Such occasions provide the only avenues for political expression, under the Islamic military government to the Umma Party leader, also the leader of the powerful Ansar sect, to express his opposition to the regime's policies.

Using religious terminology, the Umma Party leader called for a 'civil jihad' against the regime. Sadiq al-Mahdi has occasionally spoken of a 'civil jihad' although he has never fully explained what he meant by this.

By speaking out strongly al-Mahdi dispelled the rumours that he and his party were negotiating with the regime. Throughout the period of Ramadan, there were persistent rumours that al-Mahdi himself or some other leaders of his party were engaged in serious reconciliation talks with the regime.

The formal agreement between the Umma Party and the SPLA, on December 17, 1994 committing themselves "to political co-operation, working for the restoration of freedom and democracy and recognising the right of the South to self-determination" came after difficult negotiations over a period of 13 months. The Umma Party showed great courage in breaking away from the traditional positions held by parties in the North on unity and territorial integrity of Sudan.

The two parties differed on a number of issues. Chief among them is the question of self-determination for the Ngok Dinka people of Abyei, and the people of Nuba mountains and Ingessini hills. The British had placed these in the northern administrative region and so the Umma Party is reluctant to concede the right to self-determination to the people of Abyei and opposed to any such claims by the Nubas.

Most South Sudanese have always regarded Abyei as part of South Sudan and have never accepted the division of the Dinka people putting the Ngok Dinka of Abyei in the North. Nuban people and Ingessini people are non-Arabs who by accident of history have found themselves under the rule of the Arabs. They have been subject to discrimination and persecution. They joined the SPLA's struggle and proved themselves to be valiant fighters. It would be difficult for the SPLA to consider them different or agree to the denial of the right of self-determination to them.

The preliminary agreement among the opposition parties in late December and the Declaration by the extraordinary conference of the National Democratic Alliance (NDA) in June were built on the Chukkudum agreement and would not have been possible but for the principled stand of the Umma Party.

Already the December meeting acknowledged that the civil war is of 'national origin' rather than a Southern problem. This was a major political victory for the SPLA. It also placed the agreement in a regional framework. Its opening statement referred to the "consequences of the policies of the regime on the security and stability of the region".

It further linked the agreement to the stalled peace initiative of the Inter-Governmental Authority for Drought and Development (IGADD) consisting of Kenya, Ethiopia, Eritrea, Sudan and Uganda. IGADD holds the view that any peace in Sudan should be a just and lasting one and not merely a temporary accommodation with the NIF regime. Its peace committee analysed the political causes to the conflict and based its solution on two principles. It recognised Sudan as a richly diverse country which has to be governed by a democratic political system free of the involvement of any religion. Also it recognised that the people of the South, Nuba mountains and the Ingessini hills must be accorded and granted their right to self-determination.

The Sudanese regime was opposed to the two principles of democracy and self-determination as the basis of IGADD peace initiative. It strongly criticised the findings of IGADD Committee and questioned the legitimacy of some of the member governments. It actively attempted to subvert the governments of Eritrea and Uganda. As a consequence they broke off diplomatic relations with Sudan. This gave the chance to the Sudanese government to claim that neither Uganda nor Eritrea was neutral with regard to Sudanese matters and therefore should not continue as members. It further alleged that the lack of neutrality had

obviously affected the Committee's findings in the first place.

The Asmara Special Conference of the NDA came at a time when many were writing off the Alliance as an exercise in irrelevance. For six years the opposition parties had failed to address the political issues with a united voice and had lacked a clear agenda.

In Asmara the NDA fully endorsed the IGADD peace process and its proposals on democracy and self-determination. NDA recognised self-determination as the key to conflict resolution and peace in Sudan.

The conference of the NDA on the 'Fundamental issues of the Nation' was held from June 15 to 23 this year. The conference was attended by leaders and delegates representing the Democratic Unionist Party, the Umma Party, the Sudanese Communist Party, Union of Sudan African Parties, Sudan Peoples Liberation Army and Sudan Peoples Liberation Front, Legitimate Command, Sudanese Alliance Forces, the Beja Congress, Sudan Trades Union and a number of independent national personalities.

Together they can claim a very wide spectrum of public opinion and representation of the majority of the people of Sudan. The participation of the two groups of opposition armed forces was particularly significant.

It is admitted that the army in Sudan is restive. The government's fear of the army was underlined by the sacking of some 60 senior officers in December and 169 middle ranking and 137 non-commissioned officers in February.

Recruitment to the army opposition organisation, the Sudanese Alliance Forces, is reported to be growing significantly. The group led by Brig Abd-al-Aziz Khalid Osman was formed by officers unhappy with the inactivity of the opposition Legitimate Command of the Sudan Armed Forces.

The Asmara Communiqué addressed the basic issues of the right to self-determination, relationship between religion and politics and the system of administration during the interim period. The conference recognised that the exercise of the right of self-determination constituted a solution to the problem of ending the agonising civil war and facilitating the restoration of democracy in Sudan.

With regard to this crucial issue the conference drew a distinction among the South (pre-1956 borders), the Abyei district and the Nuba mountains and Ingesseni hills. While the conference decided that the people of South Sudan shall exercise the right of self-determination, before the expiration of the interim period, it proposed a separate procedure for the people of Abyei district.

"Their wish to either remain within the administrative set up of Southern Kordofan region or join Bahr el-Ghazal region (North) shall be ascertained in a referendum to be held within the interim period but before the exercise of the right of self-determination for the South. If the majority wish to join the 'South' they shall exercise the right of self-determination as part of the people of South Sudan".

The NDA did not concede the right of self-determination to the people of Nuba mountains and Ingesseni hills. The communiqué says that "a political solution to redress the injustices suffered by the people of these areas shall be sought by the interim government and that a referendum to ascertain their wishes on their political and administrative future shall be organised and carried out within the interim period". Obviously what is envisaged is within Sudan and in the North and not as part of what might evolve in the South. The distinctions made among the different areas are bound to create problems for the SPLA especially in view of the fact that break-away groups from SPLA are quite powerful.

It was agreed that the options to be presented in the referendum in the South shall be (a) unity (confederation/federation and (b) independent statehood.

There is an apparent dichotomy in the provision that "the Central authority shall within the interim period devise and implement the necessary confidence-building measures and the appropriate restructuring of the state and socio-economic institutions and processes so that the exercise of the right of self-determination could have the best chance of upholding the unity option" because the same interim period will be utilised by movements in the South for campaign for the option of independent statehood.

It is therefore not surprising that the duration of the interim period was a matter of contention from the time of negotiations between the Umma Party and the SPLA. The SPLA argued that the interim period should not be more than two years. It fears that a longer period will be misused by the central authority and may be tempting to the army to stage a *coup d'état*. The Umma Party wanted a longer interim period of six years to maximise chances of building confidence for the South to stay within a unified Sudan under a new dispensation. In the end they agreed on a flexible interim period of a minimum of two years and a maximum of four years.

The issue of religion is central to politics in Sudan. The present regime is described as 'fundamentalist Islamic'. One of the main causes of the civil war was the introduction

of Sharia in 1983. The two major parties Umma and DUP have large followings of religious groups.

The Alliance agreed on principles that would guarantee equality of all religions before law and promote religious pluralism. There shall be no discrimination on religious grounds and no political party shall be established on religious basis. These are provisions obviously agreed upon by Northern parties to strengthen the unity option. But they will find it hard to sell them if the South opts for independence.

The programmes adopted by the NDA conference on the basis of a consensus include "the removal of the present regime, the ending of the civil war and realisation of peace, the restoration of democracy and the creation of a conducive atmosphere for the establishment of the new Sudan".

If the international community, to which the communiqué appeals for support, has not been enthusiastic about the NDA in the past, it was not only because the alliance was ineffective and it had no credible programme but also because its members including the Umma Party had been responsible for fuelling the civil war before the *coup d'état* of 1989.

It is not forgotten that the National Islamic front which became the chief beneficiary of the coup was actually brought into the government by Sadiq al-Mahdi. It was he who scuttled the agreement between the Democratic Unionist Party (DUP) and the SPLA during his premiership. Going back further in history when Sadiq al-Mahdi was prime minister in the mid-60s he failed to honour an agreement on modest proposals on Southernisation of administration and instead embarked on a policy of repression. However there is every reason to think that today he sincerely believes in the right of self-determination for the South as the only solution.

While the DUP also is a signatory to the Asmara agreement it has been ambivalent regarding self-determination. It is not forgotten that it publicly criticised the agreement between SPLA and the Umma Party on the issue of self-determination. Traditionally the DUP has been close to Egypt which has not favoured self-determination in Sudan. In fact African rulers are generally opposed to self-determination as they believe that it will lead to secession.

The Sudanese regime will attempt to exploit the weak points in the consensus of the opposition parties. But it cannot afford to ignore their newly attained strength. The government's chief advantage seems to be the increasing complexity of the situation in the South compounded by lack of unity and cohesiveness among the Southern movements.

Gandhiji and Ruskin's *Unto This Last*

M L Dantwala

The author here examines the influence of Ruskin's book Unto This Last on Gandhiji's views on the economic system he advocated, his theory of Trusteeship, economic equality, relationship between the employers and the employees and the use of modern technology. While the author shares some of Ruskin's and Gandhiji's concern, he differs from both on the issue of use of technology for economic development, while commending the search for alternatives which could avoid its harmful effects. He shares Alvin Toffler's futuristic view about the possibility of a synthesis between the low stream traditional and high stream modern technologies

AT the outset I should narrate the background under which this article has been written. A friend from Ahmedabad, Chittaranjan Vora, was translating into Gujarati Ruskin's well known book *Unto This Last*. He requested me to write a Foreword to his book. Without much thought I agreed to do so not realising how difficult the task would be.

The primary reason for my prompt acceptance of Chittaranjan's offer was the association in my mind between Ruskin's and Gandhiji's views, both moral and intellectual, and particularly Gandhiji's avowal that after reading *Unto This Last* "I determined to change my life in accordance with the ideals of the book", and added, "Out of the few books I read, the one which brought about an instantaneous and practical transformation in my life was *Unto This Last*" [Gandhi 1968 445]. At another place he says "I stand by what is implied in the phrase 'Unto This Last'. I saw clearly that if mankind was to progress and realise the ideal of equality and brotherhood, it must adopt and act on the principle of 'Unto This Last'" (*Harijan* August 25, 1946, p 281).

I read *Unto This Last* twice and a few more books on Ruskin, which emboldened me to devise a framework of the Foreword. I decided that I shall analyse Ruskin's economic and social philosophy in a broader academic frame. The textbook for my undergraduate course of "A History of Economic Doctrines" by Gide and Rist (1928) brackets Ruskin, Tolstoy and in some respects Thomas Carlyle, who preceded both, in a special category, strangely termed as 'The Mystics'. I also felt that it would be interesting to deduce the influence of this trio on Gandhiji's thought.

All the three along with Gandhiji shared the disapproval and denunciation of the

dominant economic thought and practice as represented by the classical economists. Both Ruskin and Tolstoy "condemn the Hedonistic principle and denounce money as an instrument of tyranny" which they felt had resulted in setting up a new system of slavery, hence they both advocate a return to manual labour as the only power that can free the individual and regenerate social life" [Gide and Rist 1928 510]. They, however differ in their perception of the future society. To Ruskin the future society should be aristocratic, chivalrous and heroic besides being aesthetic, to Tolstoy it was to be egalitarian, communal and above all ethical. Thus Gandhiji's stress on manual labour (charkha) owes its inspiration to both Ruskin and Tolstoy, his strong and all pervasive accent on ethics, truth and non-violence seems to be derived from Tolstoy. Gide and Rist (1928) summarise Ruskin's programme of social regeneration as follows:

"(1) Manual labour should be compulsory for everybody to live upon the fruits of dead labour of others is surely absurd and contradictory. Machinery of all kinds must be renounced, except that which may be driven by wind and water - natural forces which, unlike coal do not defile, but purify. Ruskin wanted labour to be artistic, and he longed to see that the artisan again became an artist. Tolstoy on the other hand, does not strive for artistic effect. His heart is set on rural work, which he magnificently describes as 'bread work' and which seemed to him sufficiently noble without any embellishment of any kind" [Gide and Rist 1928 512].

Gandhiji adopted the essence of the above from both Ruskin and Tolstoy and synthesised the two in the Indian context.

"(2) Work for everyone is the natural complement and the necessary corrective of

the preceding rule of no idleness and no unemployment. In society as at present organised everybody is not obliged to work while some individuals are obliged to be idle. This monstrous inequality must be remedied."

"(3) Labour would no longer be paid according to the exigencies of demand and supply, which tend to reduce manual work to the level of a mere commodity. It would be remunerated according to the eternal principles of justice, which would not of necessity imply an appeal to any written law." Ruskin elsewhere elaborates what he considers as just payment.

"(4) Natural sources of wealth - land, mines and waterfalls - and the means of communication should be nationalised. Ruskin speaks of himself as an out-and-out communist, but with a touch of the aristocrat and the aesthete. Tolstoy is a much more thoroughgoing communist and was violently opposed to that low bestial instinct which men call the right to private property. His cry was 'Back to the land' and the practice of co-operation. Everyone ought to produce his own food." In between the aristocratic and aesthetic Communism of Ruskin and the Spartan Communism of Tolstoy where should we place Gandhiji? Gandhiji claims "I was a socialist long before those I know in India had avowed their creed" (*Harijan* April 20, 1940).

(5) A social hierarchy graded according to the character of services rendered should be established. Chivalry is as necessary in an industrial as in a military service.

(6) Above all else must come education - not mere instruction. What needs developing above everything is a sense of greatness, a love of beauty, respect for authority, and a passion for self-sacrifice. Carlyle's (who preceded Ruskin) economic ideas are akin to Ruskin's. He was possibly the strongest adversary of the old classical school. It was he who spoke of political economy as the 'dismal science'. "He is equally fierce in his denunciation of *laissez-faire* as a social philosophy" [Gide and Rist 1928].

Proceeding further from Ruskin's academic status in the history of economic thought, we come specifically to his 'Unto This Last'. We shall discuss here only two issues which figure prominently both in Ruskin's and Gandhiji's thoughts, justice to which Gandhiji added non-violence as a foundation of a civil society and rejection of machinery or industrialisation in general. Justice is universally accepted as a basic value encompassing all human activities, yet perceptions as to what constitutes justice differ. Under capitalism, 'free market' is

upheld as the most arbitrator in this matter! Its motto is 'each according to his ability and the devil take the hindmost'. Ruskin and Gandhi accept the importance of ability in acquiring wealth, but not in its use which should be governed by the principle of 'each according to his need'. Hence the principle of Trusteeship evolved by Ruskin and perfected by Gandhi. Communism, on the other hand, propounds that emergence of inequality should be nipped in its bud through socialisation of all means of production and abolition of private property. By adopting the 'middle path', Ruskin partially and Gandhi wholly rejected both the amoral acquisitive base of capitalism and the Communist's usurpation of individual freedom, initiative and creativity by the state which virtually meant political dictatorship with bureaucracy as its tool. With the collapse of Communism, Capitalism with its aggressive acquisitiveness remains the only dominant ideology today. In this context, Ruskin and Gandhi's ideology which leaves scope for individual entrepreneurship and hence acquisition of wealth but social use is perhaps the only alternative. I am aware that under the prevailing ethos of consumerism, such a radical change in the value system is not possible, yet ideals like 'satya', 'ahimsa' and 'aparigraha' are too precious for the health and survival of the civilisation and should not be discarded as a lost dream.

But it is on the question of equality that I see some difference in emphasis in Ruskin and Gandhi's writings. While Ruskin along with his insistence that the rich and the wise should use their richness and wisdom for the good of all, also emphasised 'the impossibility of equality', Gandhiji's statements on equality/inequality are apparently confusing. For example, his advice to the rich was "Earn your crores by all means but understand that your wealth is not yours, it belongs to the people" (*Harijan*, February 1, 1942).² But thereafter he states: "Strictly speaking all amassing or hoarding of wealth, above and beyond one's legitimate requirement is theft" (*Harijan* August 11, 1946). And the gulf that separates the rich and the poor today is appalling. It has to be bridged. He was equally aware of the exploitation involved in accumulation of wealth. When served milk and fruit in gold bowls and plates by a zamindar host, Gandhiji expressed his reaction in following words: "Where did he get these golden plates from?" The answer, from the substance of the riots. At the same time he says: "I do not grudge the prince his palace and the millionaire his mansion, but it is my earnest request to them to do something to bridge the gulf that separates them from the peasant" (*Young India* October 7, 1928). Gandhi in his

should be fixed for maximum income that could be allowed to any person. The difference between the minimum (decent living wage) and maximum income should be reasonable and equitable and variable from time to time so much so that the tendency would be towards *obliteration of the difference*" (emphasis added). Economic equality constitutes an integral part of his constructive programme.

"This last is the master key to non-violent independence. Working for economic equality means abolishing the eternal conflict between capital and labour. It means the levelling down of the few rich in whose hands is concentrated the bulk of the nation's wealth on the one hand, and the levelling up of the semi starved naked millions on the other. A non-violent system of government is clearly an impossibility so long as the wide gulf between the rich and the hungry millions persists. The contrast between the palaces of New Delhi and the miserable hovels of the poor labouring class nearby cannot last for one day in a free India in which the poor will enjoy the same power as the richest in the land. A violent and bloody revolution is a certainty one day unless there is a voluntary abdication of riches and the power that riches give and sharing them for the common good."

Why is one man richer than the other? Ruskin's answer is, "Because he is more industrious, more persevering and more sagacious". He further added: "My continuing aim has been to show the eternal superiority of some men to other. Sometimes even of one man to all others; and to show also the advisability of appointing such persons to guide, to lead, or on occasion even to compel and subdue their inferiors according to their better knowledge and wiser will". To the poor, an employee, for example, he preached 'loyalty and duty, obedience and submission'. He told the poor "claim your crumbs from the table, if you will but claim them as children not as dogs, claim your right to be fed but claim more loudly your right to be holy, perfect and pure."

Gandhiji was sometimes equally paternalistic, yet as the above passage indicates, he did not subscribe to submission of some to the 'eternal superiorities of some'. "Millionaires no less than other business and commercial firms ought to take a parental interest in the welfare of their employees. The relations between the employer and employee have been upto now merely of the master and servant; they should be father and children" (*Young India* May 3, 1928, p 248). The employer should become father to the employees working under him. A touch of feudalism or romantic medievalism!

lists have acquired wealth and possess organising power, it is their responsibility to guide labour. He exhorted the wealthy people of England that by the strength of their possession they should direct the acts, command the energies, inform the ignorance. Ruskin and Gandhi wanted the rich men to use their capital and wisdom as a Trust for the good of all. Ruskin's emphasis was on just payment to the worker and elaborates what he meant by just payment of wages. Gandhi was more strict on the behaviour of the Trustee. He did not rule out state regulation to ensure that the Trustee "does not hold or use his wealth for selfish satisfaction or disregard the interest of the society" (see the Trusteeship Formula, Clause 4).

On Ruskin and Gandhiji's views on machine and technology I should like to be more elaborate and forthwith. On Ruskin's part I see it as a reaction to the egregious excesses of adolescent industrialisation. "Spinners at the age of seven worked in worsted factories from five in the morning until eight in the night with only one break of thirty minutes at noon under overseers who strapped them when they grew tired, young girls in mills at the busy season slaved from three in the morning until ten at night and arrived home so exhausted that they fell asleep with their poor food unmasticated in their mouth" [Lion Derrich, *Ruskin: The Great Victorian* quoted by Hasan 1985:11]. For Ruskin and Gandhi more importantly, industrialisation was the culprit who destroyed their idyll of peaceful self-sufficient rural society, in which workers bought their own raw materials spun and wove them and sold their finished good to the rural community, it destroyed craftsmanship and dignity of labour. They shrank from the idea (or vision) of skilled craftsmen turning into 'hands in factory'. For Gandhi there was an additional factor. To us in India industrialisation was associated with imperialism. India was encouraged and forced to cultivate raw cotton in preference to foodgrains which was our dire need, railways were built to transport cotton from the hinterland to port-towns for export to Great Britain, which was spun and woven in the factories in Manchester and Lancashire and the cloth so made was exported back to India. This process not only destroyed India's dispersed spinning and weaving industry, the charkha and the handloom, but the very source of livelihood of millions of craftsmen and drove them back to agriculture as landless labourers.

Yet, this revulsion towards the ugliness of industrialisation and machineries was contextual, their total rejection is to raise it to an inalienable principle. The latter proposition is unacceptable to me. Could

India have sustained her rapidly rising population with a wooden plough and rainfed agriculture or defended herself against a modern war with no better weapons than a sword! Historically the civilisation has evolved from the stone age till say Ruskin and Gandhiji's era through initially slow but persistent improvement in technology. Like time technology cannot be stopped or frozen at a point of history.

Several kinds of refutations can be advanced against this poser. One can say, do not mix up technology with machinery and industrialisation. Bio-technology for example, can be used for development. Besides no one is against machinery, it is its craze to which Gandhiji was opposed. We can pick and choose "appropriate" technology. To which we can ask: where does desirability stop and craze begin! One can cite extremes such as destruction of environment or unrestricted pollution as unacceptable. But it is difficult to fix a border line. We can pin-point what is inappropriate but cannot precisely define what is appropriate, under fast changing situations.

It is beyond the scope of this article to provide precise answers to questions raised above. Frankly, we ourselves cannot provide any convincing answers. All that we can say is that in several fields we have no choice. A glaring case is that of defence equipment. Can we reject the radar or missile technology, tanks and fighter planes, or do without satellites and remote sensing, fax machines, if you want to be a global partner? One can retort, we do not want to be global, we demand swadeshi, self-reliance if not self-sufficiency. I fully accept the principle of self-reliance in regard to essential commodities like foodgrains. But even in this regard, we had to compromise even with almost stagnant foodgrains production. We had to import large quantities of foodgrains till the high-yielding varieties of wheat and rice seeds – initially imported from Mexico and the Philippines – boosted our food production, and enabled us to discontinue imports. This is what I would like to term as 'dependency to end dependency' through indigenisation. As a matter of fact our entire industrial development from the early textile factories, and steel mills right up to automobile industry, communication technology, is derived from initial imports and technology but gradually we are becoming self-reliant in all these areas of economy.

In the mid-1960s domestic food production was stagnant creating an acute food scarcity. Rapid and fast growth of food production was the essence and hence the need of the time, a situation which I call contextual. With food self-sufficiency, we can opt for

a different technology, environment friendly. Likewise if the whole world accepts Gandhiji's non-violence as a governing principle of the polity, we can dispense with armaments. I too would prefer organic and natural farming over the current practice. But I am convinced that for at least a decade or two it will not be able to fully replace the current farming technology and feed our galloping population with organic farming, which should be our ultimate aim. As mentioned earlier, I am unable to resolve the dilemma of the compulsion of hi-tech for defence and food security and the charm of a simple life, unpolluted rivers and green mountains.

Is it possible to synthesise hi-tech with the simplicity of traditional or neo-traditional technology? Alvin Toffler, the author of *Future Shock* and the *Third Wave* says, yes. This is how Toffler sees the future. Most recent technological developments in energy, agriculture, for example, bio-technology, and micro chips suggest the possibility of whole new societies based on the fusion of the past and the future, of the First Wave (industrialisation) and the Third Wave. "One can begin to picture a transformation strategy based on the development of both low-stream village oriented and certain carefully selected high-stream technologies, with an economy zoned to protect and promote both" [Toffler 1981]. "Indeed linking of the two economic activities (the market and producers sectors) more intelligently to one another may be the missing key to the survival of the millions" Toffler gives one of his chapters the title 'Gandhi with Satellites'.

The quintessence of Ruskin's and Gandhiji's thought is fully reflected in the title of Ruskin's *Unto This Last*. The empathy for the most disadvantaged individuals and groups should mould our economic and social philosophy, politics, social behaviour and provide the basic values for their formulation. The major flaw of the capitalistic system and its economic policies is its value neutrality. The market, guided by the quest for profitability, determines the fate of the people. The excesses of the early rugged capitalism are vividly narrated in *Unto This Last*. In due course capitalism realised the imperfections of the market, and misery it inflicted on a large section of the population. It took some steps to correct the distortions; enact labour laws and introduce several 'welfare' measures. The capitalist west now talks of development with a human face, after having built its own prosperity on the most inhuman exploitation of its own native population and conquest of colonies through unspeakable brutality, in addition to the plunder of the environment.

The fact that there is less poverty and deprivation in capitalist economies than in

less developed countries and ex-communist regimes is no proof of any basic change in its value system – 'The devil take the hindmost'.

Karl Marx launched a severe attack on Capitalism, and Communism charmed the intellectuals all over the world with its egalitarian appeal. But that appeal did not emanate from the empathy for the disadvantaged. In fact, sentiments like love, compassion, charity were shunned as bourgeois morality. It was this amoral attitude of its philosophy which provided a fertile ground for the emergence of Stalinism – tyranny, suppression of freedom of the individual and scant respect for his dignity. Ultimately, it was this total disregard of human values that led to its economic and political policies which culminated in the collapse of Communism in spite of its good record in the field of literacy, health, employment and removal of hard-core poverty.

It is this concern for the downtrodden – the 'daridranarayan' – that gives Ruskin and Gandhi's thought its universal relevance in all climes and climate. Add to this Gandhi's emphasis on non-violence. Other aspects of their thought are, as we have stated, contextual and could be – should be – revised and re-designed to synchronise with the ongoing technological revolution.

Sooner or later, perhaps much later, the mankind will realise that whatever the technological progress, there is no alternative to *Unto This Last*, in which non-violence, limitations of wants and sharing constitute the ethos of a civilised society.

Notes

- 1 This is a revised version of the foreword to Shri Chittaranjan Vora's Gujarati translation of *Unto This Last*. His book has been published by Vicharadharma Prakashan.
- 2 All quotations from Gandhiji's writings are from his *My Theory of Trusteeship* edited and published by Anand Hingorani, Bharatiya Vidya Bhavan, Bombay, 1970.

INTERNATIONAL CENTRE FOR PEACE INITIATIVES (ICPI) VISION 2022 INITIATIVE

1. CALL FOR PAPERS (for all)

As India approaches the 50th anniversary of its independence, it needs a vision to move forward and the course of action to translate such a vision into reality. Such a vision cannot come from the government alone. Besides political leaders and civil servants, thinkers and practitioners in other fields must also contribute ideas for India of 2022 AD and suggestions for action from 1997 to 2022 to turn India into a prosperous and just economy, clean and efficient polity and a peaceful society. ICPI's Vision 2022 Initiative proposes to collect input to prepare a draft blueprint of strategies for India of 2022. The blueprint will be thrown open for a nationwide debate. The contributors of the most interesting papers will be invited to participate in international conferences and TV discussions. Those who wish to know more about the initiative may please contact ICPI at the address given below.

2. ESSAY CONTEST (for young scholars)

Subjects

1. Strategies for achieving more than 15% GNP growth rate for India and sustaining it until 2022 AD including strategies for complete eradication of poverty in the rural India
2. Action plan with a time-frame for achieving and maintaining 100% literacy and zero malnutrition in India
3. How to create an efficient, result oriented, fair political system where politicians and civil servants are fully accountable to people between elections and all communities and provinces share a sense of common destiny

Prizes

For the best entry in each of the three subjects

- cash prize of Rs 10000 (ten thousand)
- certificate of excellence
- publication of the essay by ICPI
- invitation to attend a high level international seminar

Also ten consolation prizes with certificates will be awarded.

Rules

The contest is open to all Indians including NRIs below the age of 35 as of December 31, 1995. There is no entry fee. For details of rules and guidelines for participation, please contact:

Mr Sundeep Waslekar, Director
International Centre for Peace Initiatives
B-704 Montana, Lokhandwala Complex
Andheri West, Bombay 400 053

Indian Industry and Industrial Policy at the Crossroads

Murali Patibandla

Indian Industry: Policies and Performance edited by Dilip Mookherjee; Oxford University Press, New Delhi, 1995; pp 378, Rs 495.

DURING the last few years we have heard and read quite a bit about how the past industrial and trade policies stifled Indian industry and the recent policy reforms would release the caged tiger. Sometimes the excess obsession with the restrictive nature of the previous policies appears to make many researchers blind to several other important aspects of the industrial structure and its evolution; in the process, they fail to identify the important gaps and shortcomings of the present policy reforms. One simple example is that one has heard several times how the industrial licensing had been a major source of entry barrier and long run market power which, in turn, made Indian oligopoly firms highly X-inefficient. But one rarely comes across a serious analysis of other important sources of entry barriers like capital market imperfections and high domestic market transaction costs, which persist even in the post-liberalisation period.

Edited by Dilip Mookherjee and consisting of nine papers by different economists, this book is one more addition to the literature on the assessment of the past industrial policies and performance of Indian industry. As the editor notes in his introduction, "one needs to understand how Indian industry performed under the policy regime in place till the 1980s, in order to evaluate the impact of the new policy approach, and what issues ought to concern researchers and policy-makers in the near future". This book succeeds in this endeavour, though only partially. It is intended to concentrate on the issue of productivity and competitiveness and the nine papers refer to different aspects of industrial performance and policy factors with a rather loose common link. The topics range from industrial organisation and its link with poverty, pricing behaviour at macro level, technology, natural monopolies, competitiveness, industrial sickness, and public sector firms to issues regarding small-scale industries. The reader has to make an effort to find out how to assess the present policies for their long-term effects by filling in several conceptual gaps.

Some of the papers, for example the one by Sankar, are quite refreshing and contextual. Sankar's discussion of conceptual aspects of pricing policies for

natural monopolies is very relevant in the context of opening up of the public utilities like the power sector to the private (multinational) corporations. The controversy associated with the Enron power project is rather inevitable because there has not been any serious analysis or discussion of the issues regarding the pricing policies for natural monopolies by Indian economists or policy-makers in the past or more importantly in the context of market reforms, which might have been a fallout of the excessive obsession with negating the past policies. The issues on the regulation of natural monopolies were analysed and debated in advanced capitalist economies because government plays a very important and pervasive regulatory role. So far, market reforms in India have been propagated in terms of removing government controls and opening up of industries to domestic and multinational capital by ignoring one important aspect of a market economy – that it is sustainable only in the presence of institutions that could define and regulate unfair (anti-competitive) practices and conduct. Sankar's paper brings out highly germane issues regarding a particular aspect of regulation. Let us hope our policy-makers and leading economists take these issues (on competition policy) for further research and policy implementation seriously before the Indian industrial structure gets caught into zero-sum games once again.

Basu's paper on 'Industrial Organisation Theory and Development Economics' attempts to present a glimpse of the scope for the application of the recent theoretical developments in industrial organisation – mostly in game theoretic terms – to the issues of poverty and economic development in the Indian context and also to provide an agenda for research. He proceeds to present a few theoretical models. One gets the impression that most of it is repackaging of textbook topics like (perfectly) discriminating monopoly.¹ Basu's model of extortionist monopolist is simply perfectly price discriminating monopolist (with a continuum of agents with different income levels). Perfectly discriminating monopolist is argued to be Pareto efficient by the neoclassicists (and also by Basu), because each monopolist

would be on his least cost expansion path and would discriminate perfectly among consumers, selling each additional unit to each consumer at exactly the maximum price which that consumer would be willing to pay until, at the margin, price would equal marginal cost [De Alessi 1983].² Under the neoclassical paradigm, one might be able to argue rationally that slavery is efficient and Pareto optimal. Maybe, it is common sense that efficiency is not for efficiency's sake. Perfect price discrimination, in which the producer includes both richer and poorer consumers and takes away all the surplus, could be justified for public agencies (like rice being sold at lower price in fair price shops for poorer consumers) with distributional objectives but not for private monopolists.

The application of game theory to economic issues has brought out some very powerful concepts (possible economic outcomes) like the prisoner's dilemma. At the same time, most models tend to be highly special cases because of millions of possible game theoretic outcomes. Basu observes that there is tremendous scope for the application of game theory to the issue of interaction between government agents and producers (babus and boxwallas) in the Indian context. The question, here is whether the application of these tools to some of the well analysed issues like the collusion between government agents and other powerful economic actors in political economy terms in the Indian context (by economists like Pranab Bardhan) will give us better insights. Let us hope it will provide better insights rather than just new packages. Basu advises that theories should be developed in the context of Indian institutions. Theories, developed to fit our institutions, should shed some light on how these institutions themselves change and evolve. For example, the interlocking of capital and labour markets which persisted a few years ago has ceased to exist in places like coastal Andhra with increased commercialisation of agriculture and increased awareness and ideological movements.

Balakrishnan's paper on 'The Short Run Behaviour of Prices and Quantities in Indian Industry' empirically examines the link between movements in the mark-up (over cost) component of prices and industrial output between 1950 and 1980. This link has implications for the effect of stabilisation policies on inflation. Stabilisation policies are supposed to reduce inflation so that a free market price mechanism can throw the right kind of price signals for resource allocation. But these policies, especially in the short run, may lead to reduction in output by increasing supply side bottlenecks. Micro-

economic textbooks show that if one reduces sales or output (under monopoly or oligopoly) on a given demand curve, one can realise a higher price. This is the point that comes out of Balakrishnan's paper. He shows that price-cost mark-up moves counter-cyclically with respect to output movements: the mark-ups increase when output levels decrease. If mark-ups are major components of price, the stabilisation policies might lead to an increase, instead of a decline, in prices, by reducing output in the short run. In this framework, the effect of reduction of government expenditure is a reduction in industrial output (increasing costs of production) through increase in supply bottlenecks than a downward shift in the (aggregate) demand curve. Only way prices go up as a result of decline in output owing to reduction in government expenditure is that the demand curve remains, more or less, unchanged.¹ The supply side and demand side effect of changes in government expenditure do not come out very sharply in this paper owing to specification problems in the aggregate demand and supply functions. Based on the empirical finding of counter-cyclical relation between mark-ups and industrial output Balakrishnan observes that if stabilisation policies of aggregate demand management are not supported by supply side management of reducing costs of production, they may step up inflation. Apart from this, if stabilisation policies lead to increase in costs of production for certain essential goods, they will cause a cumulatively large increase in prices.

One of the drawbacks of this paper is that the data refers to the period prior to the policy reforms. The mark-up behaviour of firms may be related to the prevalent market structure. In a more competitive environment (oligopoly) firms may have to take a cut in their profit margins (mark-ups). In other words, if the market reforms increase competitive conditions, they should reduce the mark-up component of prices. Secondly, firms will have to be more flexible in their prices to changing supply and demand conditions. In other words, it will be interesting to examine whether the counter-cyclical relation between mark-ups and output holds in the post reforms period.

Kathuria's paper on 'Competitiveness of Indian Industry' comes out with quite an incompetent definition of competitiveness. He observes: "One way to look at competitiveness is to define those activities where exports are profitable as well as competitive".⁴ In the beginning itself, a reader may wonder whose competitiveness is it all about. This approach gives him enough room to go all over the time and space of Indian industries without any focus and in several instances contradicting his own arguments. Any student working on the

issue of competitiveness of Indian industry is better off taking Michael Porter's approach of competitive advantage as a reference point rather going Kathuria's way. As a matter of fact, a recent book by Jacobsson and Alam (1994) uses Porter's approach quite effectively in analysing the process of acquiring competitive advantages on the basis of a rigorous comparative case study of a few South Korean and Indian industries. On the positive side, this paper puts together some useful data.

Let us take one example from Kathuria's paper to show how one can confuse the issues when one attempts to draw strong conclusions on the basis of crude observations of empirical data. He observes that the argument of domestic market size and its implications for economies of scale and exports are exaggerated. He goes on to give the example of exports of Maruti small cars and marginal exports by the Indian bicycle industry which has a large home market. A basic reading of the neo-technology trade theories by Linder (1961) and others shows that immediate access to a large domestic market provides firms incentive to invest in generating new products and technologies and scope for realisation of economies of scale by facilitating spreading of fixed costs of R and D and production over a large volume of output.⁵ Immediate access to a large domestic market also reduces the high risk element of R and D expenditure. For many high technology industries in which the fixed cost element of R and D and production is very dominant, firms which have immediate access to large domestic markets will have an advantage in costs and lower risks over firms with access to small domestic market in the international market. But for exports to take place it is necessary that the differentiated goods produced for the domestic market should find demand in export markets which is determined by similarity in income levels (demand pattern) between trading countries.⁶ This is observed to be the main reason for volume of trade to be very high between the rich western countries with similar factor endowments and income levels (but unequal domestic market sizes) [Patibandla 1994]. Price elastic products like bicycles are produced for lower income groups and income elastic goods like Maruti cars are produced for higher income groups in the Indian market. Maruti cars could find a larger part of the world market dominated by high income countries. A large domestic market will facilitate both static and dynamic scale advantage to firms producing income elastic goods towards competing in the world market.⁷

One way the domestic production with a small domestic market could still be export competitive is that advantages in cheap

skilled labour are more dominant than the fixed costs element (economies of scale) in production. If the advantage of large domestic market size is combined with inexpensive skilled labour, it will certainly lead to high levels of export competitiveness. Fixed costs in production for manufactured products like luxury cars are very high. When they are produced in developing countries, given the small size of the domestic market, the scale of production will be suboptimal compared to world standards.⁸ If multinationals start producing these products, it could be mostly to capture the protected domestic market.⁹ Secondly, while one is talking of exports of Maruti cars, one has to make a distinction between subsidising exports with the excess profits made in the domestic market and exports made possible by pure cost competitiveness.

Margit and Singh's paper presents a survey of literature on technology in general and in the context of Indian industry. These two components are highly disjointed and several other issues of relating technological change to demand and market structure conditions are ignored. For example, they discuss learning by doing economies in the conceptual part but do not look at the application of this concept to Indian industry. They should have done it at least in the case of the machine tools industry as the learning effects are generally observed to be significant in the capital goods industry and generate positive externalities to other industries. The discussion on the learning economies ignores its link with industrial growth and demand factors under Kaldor-Verdoorn law.

Anant and Goswami's paper on sickness in industry is quite impressive in tracing out the institutional aspect of the credit policy and its effect on the firm's behaviour and incidence of sickness in Indian industry. The study of institutions and the underlying factors governing the functioning and changes in institutional conditions from a systematic economic historian's perspective could be very useful in the context of the present reforms in shaping the complementary institutional reform policies. One of the notable observations the authors make is that, by 1989, outstanding credit locked up in sick private sector units had shot up to Rs 9,353 crore and 75 per cent of it was locked up in large and medium scale firms. This observation debunks the view that it is the small-scale sector that has been pampered by an easy credit policy. Secondly, Anant and Goswami observe that "except in some states, there is no widespread evidence of labour presenting insuperable hurdles to private sector restructuring". The labour policies in a state like Gujarat led to textile mills declaring lock-outs to escape the barriers imposed on retrenchment. Between 1983 and 1994, 50,000 odd workers

lost their jobs because of the closure of privately owned textile mills in Ahmedabad city. As Roy Chowdhury (1995) shows most of these workers failed to receive due benefits which were due to them. The instrumentalities adopted by the Textile Labour Association to get compensation or alternative employment from the central government for these workers have been largely ineffective. This clearly shows the failure of the present policy regime which propagates the so-called structural adjustment without building up the minimum necessary institutional conditions to cope with the extremely unequitable outcomes of the market reforms [Patibandla 1994a].⁹

Ira Gang's paper on small firms in India is quite refreshing as it presents a balanced assessment of the role of the small-scale sector in the Indian economy. There is a large body of literature on small firms in India and very rarely does it ask right questions and, in several instances, the views or assessments are based on preconceived notions. One heard a lot about how the small-scale sector in India has been pampered by micro level incentives like fiscal concessions and reservation policies. But this view ignores that in pursuit of heavy industrialisation the macro policies have favoured large-scale capital intensive production. The micro level incentives were provided to compensate for this bias against the small scale sector, which might have made things worse. Despite the inimical macro policies and capital markets the contribution of small firms to employment generation, output, and exports has been quite remarkable. For example, in 1989-90 57.4 per cent of industrial production was accounted for by small firms. 134 lakh persons were employed by this sector by 1992-93, and it accounted for 33.34 per cent of total exports. The arguments for removal of micro level incentives to small firms have to be followed by a reduction in macro policy bias against them. Capital market imperfections and the high transaction cost nature of the Indian economy work systematically against small firms' growth and mobility. The present policy reforms are not expected to be employment-generating in the organised manufacturing sector. In this context and given the importance of SSI sector in employment generation, there is need to design an effective alternative institutional support mechanism for small-scale firms. We might be able to learn a lot from the Taiwanese experience.

The large body of conceptual and empirical literature on industrial economics shows that industrial policy has to continuously watch out for trade-offs and has to be based on a coherent conceptual definition of structural factors and outcomes. For example, the highly talked about result of MRTP and

licensing policies is that it led to suboptimal scales and entry barriers. But the reforms of industrial delicensing could lead to the same result of suboptimal scales. For example Jacobsson and Alam (1994) in comparing the Indian and South Korean hydraulic excavators industry observe that while the Indian government liberalised its licensing policy in the 1980s to allow for a greater level of domestic competition, the Korean policy meant a restriction in the field to only two producers. Second, while in the case of India the protection from imports seemed indefinite the Korean government clearly set a limit on the protection. "Restriction of entry allowed South Korean firms to realise economies of scale advantage in exports and the threat of import competition made them to make systematic technological efforts to remain highly competitive. In other words, the South Korean policy was able to combine trade and industrial policies quite effectively. It was able to use import protection levels as an effective strategic signalling towards disciplining domestic producers. From this observation one can clearly see that the industrial policy in India led to the opposite results: the delicensing led to excess entry and to suboptimal scales and the policy signal of indefinite import protection to inefficiency [Patibandla 1995a]. They also point out one of the fall-outs of the liberalisation: three of the Indian producers are large and competent enough to undertake product development. Not only this, one of them had developed a design and planned to produce it but once technology imports were liberalised the firms completely abandoned product development activities."

In the context of the present reforms if policy intends to be neutral to structure in terms of concentration levels, it has to define systematically possible anti-competitive conduct by dominant firms. A simple example is prices going down because of economies of scale or efficiency gains versus prices set low as predatory pricing strategies towards eliminating rival firms. Secondly, absence of entry barriers implies that an absolute new entrant with a viable project could raise capital without any relative disadvantage and contest incumbent firms. But in Indian industry severe capital market imperfections and institutions that led to high transactions costs work in favour of dominant incumbents and multinationals with large purses [Patibandla 1995].

For the market reforms to be true to their spirit, it requires effective institutions that could define and implement effective regulatory policies (competition policy) which means that market reforms have to be supported by complementary institutional reforms. In the absence of effective complementary institutions the regulatory

institutions themselves could be captured by powerful coalition groups. North (1990) observes that the US government intervention into markets through effective anti-trust laws emerged because of severe competition among American capitalists. Following from this observation if the dominant firms in Indian industry get into implicit collusion, emergence of effective regulatory mechanisms will be thwarted.¹⁰

This book is a good beginning at bringing in some amount of rigour to issues on industrial economics in the Indian context. It is rather overpriced especially as it intends to cater to students in a developing country.

Notes

- 1 Basu argues that it is in the interest of a monopolist to exclude the poor from the market. A monopolist has no interest in poverty. She simply takes an exogenously given demand curve determined by incomes and number of consumers in a market and maximises her profits. The profit maximising price is higher than that in perfect competition, so she serves lesser number of people. As a matter of fact it is in the interest of a monopolist to see that poverty is reduced or incomes go up because that could shift the demand curve outwards and increase total profits. A monopolist might be interested in causing poverty if she is a price setter in the input markets. This point is quite obvious to Marxist economists.
- 2 If transaction costs of implementing perfect price discrimination are higher than the surplus, a perfectly discriminating outcome will not be Pareto superior to a simple monopoly equilibrium.
- 3 If the reduction in government expenditure shifts the demand curve downwards, prices do not have to increase.
- 4 Furthermore, he makes the observation that the exchange rate determines competitiveness (which is another word for productivity in this paper). Basic economics textbooks show that it is productivity that determines the exchange rate. The US dollar is more expensive than the Indian rupee because American labour is supposed to be more productive. If policy interferes in the determination of exchange rate, it will have implications on the relative prices and profitability of domestic sales versus exports. Devaluation is a means for adjusting the exchange rate to the productivity level of domestic labour or, in other words, telling us you are less competitive or productive and you should give more (value for) goods in exchange for lesser (value for) goods produced abroad.
- 5 Eminent economic historian Rosenberg observes that the isolationist policy of the US prior to the second world war led to high levels of productivity in American industry by giving it sole access to a large (homogeneous middle class) domestic market.
- 6 Linder calls it a representative demand in trade.
- 7 One can come with the counter example of South Korea where firms were able to become internationally competitive with a small domestic market. But one has to be careful about Korea's case because the institutional mechanism was quite different where firms

- were made to export right from the infant stage by a 'carrot and stick' policy mechanism
- 8 One way multinational firms could overcome this disadvantage of small volume of production in the Indian market is by importing major part of components of a car and assembling them in India. But even this strategy might be mostly to capture the protected domestic market rather than for exports. If import protection in these final goods industries is removed, foreign direct investment in these industries may not come in at all. This author is grateful to Pankaj Chandra for pointing this out.
- 9 The World Bank and IMF-sponsored structural adjustment and stabilisation policies are basically standardised package deals applied to the developing countries without regard for the specific institutional conditions of different countries. Recent times, there has been growing recognition that institutional conditions matter a lot more than just getting prices right. See Williamson (1995).
- 10 To put in terms of Williamson's (1995) language, we have to get our institutions 'right' rather than just the prices.

Sociology of Religion in New Social Movements

S M Michael

A Future for Religion? New Paradigms for Social Analysis by William H Swatos, Jr (ed); Sage Focus Edition, California, 1993; pp xviii + 210.

NEW religious movements in contemporary world have demonstrated that the traditional theories on sociology of religion are inadequate to explain the new wave of religious activity. Hence, this book attempts to reorient the sociology of religion to new paradigms in social scientific inquiry. The book contains 11 research articles and they explore a variety of trends in social analysis of religion in contemporary world. Each article surveys existing literature, offers a substantial contribution and also proposes concrete research agendas.

The editor, William H Swatos, in his 'Introduction' points out that in the new paradigm of the sociology of religion one must radically redefine 'secularisation'. It is because modernity arouses expectations that it cannot satisfy without stimulating the

religious imagination. According to him the concept secularisation proposes ways of knowing how the world works, and also it challenges the widely accepted epistemological assumptions. Hence, secularisation is primarily a concept for the sociology of knowledge, and only secondarily for the sociology of religion.

The resurgence of religion in contemporary times makes us realise that social science is not the application of timeless truths but the development of explanatory and predictive constructs that tell us how to go on in varying forms of human life. In formulating theories we need to be attentive to the life world, i.e., to the problematics that constitute existence in our time and the implications for the future. The editor stresses the importance of departing from the anti-religious bias of the

'old sociology' to move to study religious experiences in the light of the newly emerging world.

The first article, 'New Social Movement Theory and the Sociology of Religion: Synergies and Syntheses' by John A Hannigan approaches the sociology of religion from a new social movement perspective. According to him this approach has the particular advantage of combining structural and cultural elements in social experience which transcends the traditional functionalist-conflict debates in sociological theory and thus really take us beyond the classics. For example, the ecology movement has a spiritual potential to transform modern societies. Similarly, the feminist spirituality in combination with the ecology movement has the capacity to replace socialism as the first genuinely modern form of religion. Ecofeminism equates the suppression and domination of nature with the domination of women and encourages a more spiritual approach to the natural world. Deep Ecology is an ecophilosophy that stresses the fundamental interrelatedness and value of all living things. It encourages a renewed sense of harmony with nature, even if this means that humans have to scale back their material demands and live a simpler life. In this century, nature religion has found form in the green movement, in the spirituality of North American native peoples, and in various New Age movements. The 'Creation Centred Spirituality' of the Catholic theologians is related to this eco-spirituality of women.

Global fundamentalism is another area of research in the sociology of religion. This has been studied by Frank J Lechner. It seems fundamentalism is a form of antimodernism aimed at restoring meaningful order on the basis of sacred tradition. The changing global condition not only becomes a context and target of fundamentalism, but also it tries to restore a sacred tradition as a basis for a meaningful social order. Studying fundamentalism, then, becomes a matter of examining how the tensions produced by the clash between universalising global culture and particular local conditions take place.

In his article, 'Religion, Class Conflict and Social Justice', Eugen Schoenfeld points out that religion is one mechanism by which different classes seek to legitimate their point of view and the social order that they seek to maintain or change. The poorer classes stress the ideology of justice and equality and the primacy of the collectivity. These values reflect their class interests. Thus, for example, the liberation theology, a theology associated with the underclass in South American countries stress the importance of economic and social justice which has emerged from the third world countries.

Justice addresses the idea of distributive equality, namely, it emphasises the rights of all to have access to those conditions that determine people's life chances like income and health care. The developed capitalistic countries like the US, for example, stress the values of freedom, individualism and self-determinism.

Individual freedom is an important Protestant virtue. It proposes the right of each person to maximise his or her own economic interests. Individualism is reflected in the legal concept of contract and is associated with the principles of freedom, as the right of the individual to control his or her own property. Equality, in contrast to freedom, justifies and places primacy not on individual rights, but on collective rights. While freedom argues for each person's right to control goods and services, to maximise self-interest, equality calls for the sharing not only of power but also of goods and services. Both values, freedom and equality, thus become legitimators of class interests.

Justice as a moral principle prescribes both individual and collective commitment to ensure the life chances of others. Freedom, in contrast, stresses the sanctity of human uniqueness and the right of every person to differ from collective in respect to thought and preference for a given way of life. If so, according to Schoenfeld, the important questions to examine are: Do the religious values of justice and freedom reflect class interests, and does religion hence become the means by which moral teachings become the legitimator of class interests?

In 'Religion in Capitalist East Asia' Joseph B Tamney maintains that folk religions have been the most popular ones in this region. As this region is in the grip of modernisation, the folk religions of the Chinese, Japanese, and Korean peoples are increasingly less acceptable as worldviews to people of east Asia. As folk systems dissolve in the process of modernisation, many east Asians remain without religious affiliation. That may be the reason that this region contains the highest percentage of religiously non-affiliated people.

Tamney studies the major religions of east Asia, namely, Buddhism, Japanese New Religions, Christianity and State Ideologies. Although Buddhism is described as the dominant religion in the region, actually relatively few people are committed to pure, non-syncretic Buddhism. Buddhism has co-existed with animism; the latter belonged to the masses, while Buddhism was the religion of the elite. Throughout the east Asian region, efforts are being made to purify Buddhism by disentangling it from folk religions. According to Tamney, Buddhism certainly has a future. All the same, today the Buddhist meditation has been secularised. Meditations

are practised for relaxation, mental power, or worldly success. A person need not become a Buddhist to benefit from meditation. Hence, in the view of Tamney, it is not clear that in future Buddhism will be a dominant worldview of east Asia.

The Japanese groups are syncretic blendings of elements from folk religion, Buddhism, Confucianism, and Shintoism. So new religions flourish in Japan. In 1980, 22 per cent of the population belonged to the new religions. The new religions are reactions to the corruption of Buddhism and the failure of Buddhist and Taoist priests to reach out to people dislocated physically and culturally. The new religions develop organisations to give counselling and fellowship to uprooted and lonely people, and within them women are allowed a greater role than in all other social institutions. The new religions flourish because they are bridges between tradition and modernity.

Christians are a significant part of the population in South Korea, Singapore, and Taiwan. Generally, Christianity has been able to grow in east Asia because liberal Christianity which emphasises the struggle for social justice has played an important role in Asia, especially in Korea and Taiwan. Christianity, like the new religions, has been able to co-opt elements of folk religions while retaining a modern image. As a result, the co-option of folk-elements has increased the popularity of Christianity. In addition, charismatics, more than others, offer rewards formerly associated with family life, namely, personal counselling and a sense of community.

Confucianism functions in east Asia as a quasi-religion and its approach is linked with nationalism. It has also significantly influenced education in the region. Tamney stresses the importance of research to determine the relative significance of secular and religious ideologies in the context of folk religions losing their usefulness, legitimacy and integrity in east Asia.

W E Hewitt in his article 'Liberation Theology in Latin America and Beyond' deals with liberation theology which emerged as a subject of considerable interest and controversy, since the Latin American Bishops' meeting in Medellin, Colombia in 1968. It is believed that liberation theology offers insight into the causes of poverty and injustice in the world and promotes work with the less privileged in their struggle for a better life.

In spite of criticisms, there can be little question that the strong political language and abiding concern for a just social order voiced by liberation theology has found a home within the Church. An example of this tone is evident in the following excerpt of a 'Pastoral Letter' written by 16 Roman Catholic bishops of third world: "It is not

true that God wishes there to be rich men enjoying the good things of this world by exploiting the poor: it is not true that God wishes there to be people always wretched. Religion is not the opium of the people. Religion is the force that exalts the humble and casts down the mighty from their seats that gives bread to the hungry and reduces to hunger the overeaters."

While underdeveloped Brazil is clearly the leader where the institutional commitment to social justice is concerned, Canada with a much higher standard of living has also moved significantly in this direction. Interestingly as well, Canada is more progressive in this regard than the US, despite the fact that the two countries are nearly identical in terms of economic performance.

In 'Religion and the New Immigrants' Peter Kivisto states that since second world war, both western Europe and North America have experienced the creation of substantial immigrant communities. One consequence has been the emergence of a 'race problem'. Until recently, it was taken for granted that different racial and cultural groups will be Americanised in the melting-pot of America culture. But today this approach seems to be too limited in the complex reality of America. Hence, the task of ethnic studies becomes vital to understand the processes in American society. In this context it is important to know how different racial and cultural groups with their respective religious affiliations adopt themselves to the American way of life. But unfortunately, less research has been done on religion than on the issue related to the economics and politics of immigration communities. Hence, according to Kivisto, the review of recent research shows that for some ethnic groups the religious dimension is a virtually untapped topic.

In the next article, James V Spickard pleads 'For a Sociology of Religious Experience'. More than 30 per cent of Americans claim to have some kind of religious experience. Yet, according to Spickard, sociologists have not comprehended religious experience well. Since the pioneering work of William James, *The Varieties of Religious Experience*, in 1902, no progress has been made in the field of religious studies. James grounded religious experiences in feelings, which he treated as private. Treating experiences as private, however, removes them from the social sphere. So, since James, the sociology of religion has focused on religious institutions and religious ideas. Sociology of religion has neglected religion's experiential side. Now with the emergence of New Religious Movements and New Age groups it is becoming clear that religious experiences are fully social phenomena and they require scientific study.

The eighth article is by Daniele Hervieu-Leger on 'Present-Day Emotional Renewals

The End of Secularisation or the End of Religion'. The classic approach to religion stressed the increasing autonomy of man over nature and the gradual secularisation of religion from human life. The rise of secularisation and the varying degrees of separation between church and state were the legal and institutional symptoms of the declining hold that the religious institutions had over society. However, now, perturbed by economic crisis and international disequilibrium there is a return of a religious quest. The increasing religious renewals and new religious movements tend to suggest the possibility of a massive return of the sacred on the verge of the 21st century.

Some see the 'return of religion' as a regression, an irrational reaction to uncertainty and unrest. Others hail it as proof of the invincible religious dimension of man, over and above the illusory triumphs of rationality and positivism. In the midst of this ideological differences, it is important to rethink on the concept of secularisation for further advancement of sociology of religion in contemporary times.

'Religion and Body: Sociological Themes and Prospects' by John H Simpson traces the very origin of sociology to the social changes and conflicts that occurred in the west with the rise of industrial capitalism, mass democracy, science and technology. In its understanding and developing sociological theories, sociology drew upon certain intellectual resources and rejected others. The primary dualism of western culture between body and mind, matter and spirit, nature and culture, desire and reason influenced the development of sociological theories. Accordingly, the founders of sociology pushed the body outside the domain of sociological discourse. All modes of production, however, with the exception of communism, according to Marx, dehumanise the body by exploiting it. Capitalism reduces the body to the status of a labouring machine.

Not only capitalism but also the development of scientifically based medicine also tended to disembodify the human actor by progressively isolating the physical body as an object of study and control. Thus, the body came to be viewed as a mechanism or system that could be regulated and repaired, if necessary, like any machine.

In post-modernism, western industrialised societies have moved into the period of 'late capitalism' and the mind is considered to be complementing the body. Thus, in late capitalism the problem of social control is relocated from the body to the mind. The question no longer is: "How can the mind be used to control the body?" The question now is: "How can the body be used to control the mind?" In the medical field, western medicine based on science and the clinic

may be supplemented or replaced by alternative forms of body care.

There has been in recent years a remarkable explosion of healing practices and alternative therapies that move away from the modern notion of the body as an object that can be cured only by science. These conditions lead to several questions with respect to the role of religion in the relationship between body and mind.

The 10th article is by Mary Jo Neitz on 'Inequality and Difference: Feminist Research in the Sociology of Religion'. For a long time religion has been a major institution for social control of women. It has been the focus of feminist attacks on institutionalised religion and its treatment of women. Yet women have also found ways of using religious ideologies to argue for egalitarian treatment or demand that men change their behaviour. The women's spirituality movement embraces a number of women-centred ritual groups that do offer ideologies explicitly supportive of women's authority. Rituals offer settings in which women who have been marginalised and alienated can be healed.

The last article, 'Back to the Future: Applying Sociology of Religion', by William H Swatos Jr highlights how sociology of religion can be an applied field of research. Actually, from its beginning sociology of religion had an applied part. Both, the *American Journal of Sociology* and the *Social Forces*, in their early years carried a large number of articles on religion of an applied nature. This was not the case in the US, however. The German sociologist Max Weber, in fact throughout his life had a commitment to applied concerns, particularly with respect to religion. The French sociologist Emile Durkheim also saw sociology as leading

toward a sociology of morals by providing a base for a covenant that would bind men and women together in a meaningful social order apart from the harsh pragmatism of contractual existence.

The breakdown of the sociology-and-religion alliance is attributed to William F Ogburn's presidential address to the American Sociological Society in 1929 in which he stated that sociology "is not interested in making the world a better place to live". Religionists were particularly singled out for criticism as relics of a bygone era. From this influence, researches on sociology of religion began to be a private affair of the seminaries and other religious institutions.

Swatos highlights the uniqueness of human beings to create symbols. As symbol creators, human actors are able to construct ideals within their social relations of how life ought to be. This dimension of human creativity in religion has been too much neglected by the social sciences and need to be reclaimed.

As a conclusion it may be observed that the editor has shown clearly the new dimensions in sociology of religion which the classical schools neglected as personal and private concerns and do not fit into the positivistic approach to the study of religion. This book introduces new paradigms in the study of sociology of religion to be developed in the context of new religious movements. The merit of this book might have been further enhanced by taking also into consideration the new nationalistic aspirations of people using religion as a means to acquire power as in the case of Ireland, Bosnia, India and Sri Lanka. All the same, this book is a valuable addition to the field of sociology of religion and new social movements.

NEW BOOK FROM	MD	PUBLISHERS OF THE HUMANITIES, NATURAL & SOCIAL SCIENCE
CHALLENGES BEFORE THE ELDERLY An Indian Scenario Edited by S Vijaya Kumar		
1995, xx, 286p, ref, tables; 22x14cm ISBN 81-85880-87-5		
Rs. 400.00		
This book focuses at the most fundamental issues of gerontology. It discusses the quality of life of the elderly in the developing countries like India, where the traditional family bonds are changing along with the development of the society.

Working Mothers and Child Survival in Rural India

Insights from Spatial Patterns

N Krishnaji

This paper analyses the levels and gender differentials in child mortality across the rural parts of the Indian states in relation to the work status and work participation rates among women and two other correlates of mortality, viz, fertility and female literacy. Since states are large and some of them contain sub-regions which vary considerably with respect to both agro-economic and cultural factors, the correlations are examined in more detail at the district and sub-regional levels as they are observed in Andhra Pradesh. The paper concludes with a discussion of the main issues.

I Introduction

THERE is some evidence to show that in rural India working mothers experience a greater degree of child loss than do non-working mothers. However, although the mortality rates among children of working women are relatively higher, the gender differentials in them are distinctly narrower [Basu and Basu 1991].

These correlations, observed to hold in terms of the levels and gender differences in child mortality in different data sets (including those based on the 1981 Census), are not perfect. In any case, inter-regional variations in child survival chances merit analysis since the underlying economic and cultural factors have well known regional patterns within India. For example, the gender bias against females in general and female children in particular is much stronger in the north and the north-west than in the south where, coincidentally, employment levels among women are higher. The apparent conflict between women's work and child survival needs to be understood in terms of the causal links because it is not immediately obvious why higher rates of child mortality should be associated with working mothers. Basu and Basu (1991) and Basu (1992) examine the mechanisms and intermediate variables that are likely to bring about the observed correlations. They suggest that time is probably the most important factor in this context: other things being equal, a non-working mother can provide more time for child care.

Whether, however, this conflict between work outside home and time for child care can lead to the observed large differences in child survival needs to be probed further. This paper argues that an alternative explanation of the empirical findings is possible: Working mothers in rural areas generally belong to poor labour or peasant

families; the extreme poverty in such families may explain the higher death rates; and, to the extent that the conditions of poverty apply equally to girls and boys, the narrow gender differentials in survival may also be a reflection of these conditions.

The paper begins with a statistical analysis of the levels and gender differentials in child mortality across the rural parts of the Indian states in relation to the work status and work participation rates among women and a couple of other correlates of mortality, viz, fertility and female literacy. Since states are large and some of them contain subregions which vary considerably with respect to both agro-economic and cultural factors, the correlations are examined in more detail at the district and subregional levels as they are observed in Andhra Pradesh, one of the bigger states.

A brief discussion of the main issues appears at the end.

II State-Level Variations

Levels of child mortality vary considerably across the different parts of the country. The spatial variation remains despite a general improvement in child survival rates during the last four decades or so. Estimates based on the 1981 Census show that for rural India as a whole the mortality rates of children in the age group 0-4 years were 147 and 157 (per 1,000 live births) for males and females, respectively, implying an excess female child mortality (over that of males) of about 7.4 per cent. The extent of regional variation is illustrated by the contrast between Kerala and Uttar Pradesh. In Kerala, the child death rates are the lowest in the country, those for females being lower (at 78) than for males (at 88), whereas in Uttar Pradesh the levels are extremely high and, besides, there is a significant excess female mortality of about

20 per cent (the male and the female death rates being 187 and 224, respectively).

The state-level data on child mortality rates by gender and by the work status of mothers are presented in Table 1 in which the states are arranged in descending order of excess female mortality among children. Before we discuss these data, a word about gender differentials. It is well known that other things remaining the same, girl children are better equipped in a physiological sense to survive early childhood and for this reason a somewhat higher mortality among male children is normally expected. Indeed, the sex ratio at birth generally has an excess of males (about 105-106 males to 100 females), but female advantage of survival produces balanced sex ratios among children of age one year and above. This means that consistent and large female deficits among older children are a sure indication of a gender bias - induced culturally or otherwise - against female children.

At the top of Table 1 are the states in the western and north-western parts of the country where death rates among female children exceed those among males very significantly. In contrast, all the states in the south have narrow differences slightly favouring female survival, Kerala being the only state where female survival rates exceed male ones by over 10 per cent. The states in the east (Orissa and Bihar) and Maharashtra and Madhya Pradesh are dispersed along the array. To some extent, these data are consistent with our knowledge about the geographical distribution of gender biases and the associated cultural practices.

Let us now look at the levels and differentials in death rates among working and non-working mothers. We should note first that the census enumeration of workers among women excludes large numbers of women engaged in various unpaid productive activities and are therefore biased downwards. To the extent that the conflict

between work and child care can exist irrespective of whether the work is paid or unpaid, the bias has serious implications. However, as the Basus suggest, the conflict can be expected to be more acute in the case of women who work for wages. Nevertheless, these data are of some use in cross-sectional comparisons since the rates of undercounting of women workers may be fairly uniform across space.

For what they are worth, the data show the following patterns:

(1) In all the states, working mothers experience a greater child loss than do non-working mothers in respect of both male and female children. Thus in Kerala, where the levels of child mortality rates are the lowest in the country, the death rate for male children among working women is 109 and that among non-working women is 77; the corresponding rates for female children are 95 and 69 respectively.

(2) In the southern states and West Bengal, Maharashtra and Orissa, where, as we have seen, the gender differentials in survival are in general narrow, while work status influences the level of mortality, it does so uniformly as between boys and girls, both experience roughly the same order of excess mortality that is associated with working mothers. This again is understandable in terms of the north-south divide in respect of gender biases and associated cultures (See Table 2 in which the data are recast to show excess female mortality among children of working and non-working mothers separately).

(3) In the north and the north-west, the work status of women has a greater impact on male children than on girls. This is because in general there is a strong bias against girls, and the male children of non-working mothers are the best protected among all categories so that the withdrawal of this protection by working mothers – if what is observed can be described so – has a greater impact for boys. We should also remember that biological factors favour female child survival. To put it differently, the northern pattern of child survival is characterised by more prominent gender differentials, especially among non-workers.

The mechanisms that produce this type of regional variations are discussed in Basu and Basu (1991) and will be reviewed further in a later section of this paper. For the moment, however, let us see to what extent the 'inter-state' variations can be statistically explained by work participation rates among women (in the rural population as a whole) and two other correlates of child mortality often discussed in the literature, viz., female literacy (and education) and fertility.

A word about these correlates. Mortality levels in any region depend of course on a number of factors including living standards

and public provisioning of health care, etc. At the household level, however, factors such as the number of children in the family and whether the mother is working or not also play a part.

Since the focus of this paper is on how women's employment influences the level and gender differentials in child survival, we concentrate on a few relevant variables: work participation rates, fertility (measuring in a rough sense the child burden women bear), and female literacy. There is no attempt here to fully 'explain' the observed inter-state differences.

Table 3 presents the relevant data, where again we have ordered the states in a descending order of gender differentials in child mortality. One can see that, although the correlations are not perfect, the states in the north are associated with low levels of female work participation and relatively higher levels of fertility (as measured by the children everborn to women in age group 45-49). The variation in literacy rates, however, has no discernible regional pattern (more on this later).

Table 4 presents some regression results to explain inter-state differences in child mortality. These regressions are exploratory in nature, aimed to capture the north-south differences in the context of women's employment. (In respect of the mortality rates, probit and logit regressions – more appropriate than linear ones – were employed, but the results are not very different. In the case of gender differences in mortality, there is no simple way of making the probit and logit transformations.)

In the regression equations, a dummy variable to capture the unexplained north-south differences is included. It is unity (1) for Haryana, Uttar Pradesh, Punjab, Rajasthan, Gujarat and Madhya Pradesh

TABLE 2 EXCESS FEMALE CHILD MORTALITY BY WORK STATUS OF MOTHERS – RURAL AREAS, 1981

and 0 for other states, i.e., those in the south, east and Maharashtra. The equations were initially estimated along with a fertility measure (average number of children ever born to women in the age group 45-49) apart from the variables listed in Table 3. It was dropped because of its uniformly poor explanatory power in all the three equations: those for female child mortality, male mortality and the excess of the former over the latter.

The results (Table 4) show that of the variables considered for explaining inter-state variations only female literacy rates turn out to be statistically significant in the case of levels of mortality – both male and female, showing the direct association between relatively higher rates of female literacy and lower rates of child mortality. But in this, the death-rate-diminishing impact of female literacy is higher in the case of female children than in that of males. A comment on this comforting correlation is in order: it may actually be a reflection of the fact that female literacy rates tend to be generally high in the prosperous and more 'developed' regions, in particular it may have no implications for the reduction of child mortality through the improvement of rural female literacy in the so-called BIMARU states, Bihar, Madhya Pradesh, Uttar Pradesh and Rajasthan. That, however, is not to deny the role of female literacy demonstrated forcefully by the Kerala case as most potent.

Turning now to work participation rates among women, they do not explain inter-state differences in the levels of child mortality. This is not inconsistent with the experience of higher child losses among working mothers. While that is true *within* each state, it is clear now that the variations in female work participation rate *across* states have no relationship with levels of mortality. Two factors may be at work here: the levels in death rates are determined by a whole host of other factors and the extent of women's work may play a marginal role only, but more importantly, female work participation itself depends on a complex set of agro-economic, social and cultural factors, not all of which may influence mortality variations.

Finally, the dummy variable seeking to capture the impact of north-south cultural variations also turns out to be insignificant so far as the levels of mortality are concerned, possibly because both in the north and the south there is much variation across the states in levels of prosperity which may decisively influence the death rates.

But, in respect of the gender differentials in mortality (the excess of female mortality over that of the male one), all the three variables, viz., female literacy, female work participation and the north-south dummy,

are statistically significant in explaining regional variations.

As we have seen earlier, female literacy has greater impact on girls than on boys in terms of lowering the death rates. This results in higher female literacy rates being associated not only with lower levels of female child mortality but also lower gender differentials, i.e., excesses of female over male mortality. This equalising effect we have noticed earlier among working mothers is thus a characteristic of female literacy as well viewed in the context of spatial variations in gender differentials.

The work participation rate is a statistically significantly *negative* variable in explaining inter-regional variations in excess female child mortality. (Remember that in each

state as well among working mothers the differentials are narrower.) To some extent this is accounted by the fact that in the south female work participation rates tend to be higher and gender differentials in mortality lower. But the inclusion in the regression analysis of the north-south dummy and its statistical significance ensures that the gender-equalising nature of high female work participation operates independently of the north-south cultural differences.

III Variations across Andhra Pradesh Districts

Andhra Pradesh is one of the bigger states in the country. It shares with other southern

TABLE 4. LINEAR REGRESSIONS OF CHILD (UNDER FIVE) MORTALITY RATES

Dependent Variable	Female Work Participation Rate	Coefficient of Female Literacy	Dummy	R
Female mortality	0.41 (0.59)	2.01* (0.42)	18.63 (12.63)	0.77
Male mortality	1.04 (0.62)	1.59* (0.44)	6.10 (13.17)	0.65

states a more evenly balanced sex ratio in the population than in other parts of the country. The districts within the state are probably fairly homogeneous with respect to the cultural practices associated with a strong preference for sons and the resulting gender biases.

However, there is much variation among the districts in the conditions of women's employment, in economic prosperity and so on. The state is conveniently subdivided into three regions, Coastal Andhra, Rayalaseema and Telangana, characterised not only by different agro-climatic regimes but also by the historical evolution of land relations that determines the patterns of land use and employment in agriculture. Within each region, however, there are both relatively poor and prosperous districts. Thus for example the deltaic belt consisting of East and West Godavari, Krishna and Guntur districts in central Coastal Andhra is the highly irrigated and the most prosperous agrarian region in the state. The districts in Rayalaseema and Telangana are mostly drought-prone where agriculture tends to be rainfed except in a few irrigated tracts.

Employment levels among women also vary a lot and depend both on supply and demand conditions. For example, in the extremely poor districts of Srikakulam and Vizianagaram in north Coastal Andhra and Mahboobnagar in Telangana, there is considerable male outmigration and women in labour and poor peasant families have to work for survival. On the other hand, in the agriculturally prosperous districts such as East and West Godavari, irrigated crops like paddy and sugarcane support high levels of employment among women.

The district level data for rural Andhra Pradesh on child mortality and its correlates, based on the 1981 Census, are given in Table 5. Here also the districts are arranged within each subregion in descending order of gender differentials. In this state, as in other states in the south, child mortality levels are generally higher among the males – an expected or 'normal' feature in the absence of discriminatory practices favouring males. So districts at the top within each region are those where the highest male excess mortality is present.

As in the case of inter-state differences, regional variations in child mortality and its correlates at the district level in Andhra Pradesh are analysed through linear regressions. After some initial experimentation, only two regional dummies to account for the impact of residual regional factors such as cropping patterns determining the conditions of work for women are retained. Dummy 1 is 1 for Rayalaseema and 0 for other regions and Dummy 2 is 1 for Telangana and 0 for other regions. In the regressions the average number of children

ever born to women in the age group 45-49 appears as an explanatory variable to represent the child burden that may adversely influence child survival. An alternative measure viz. the child woman ratio was also employed in this context but the results were not very different. They are not presented here because in a statistical sense the results were inferior.

The regression results (Table 6) suggest the following relationships across the districts:

(1) Levels of child burden (as measured by the fertility of older women) across space are positively related to levels of child mortality, both among female and male children, but in this they have a greater impact on the female children, so that child burden is inversely related to male excess mortality, i.e. regions with relatively higher fertility rates have narrower excesses of male child mortality because of higher female death rates.

(2) Female literacy rates are inversely related to levels of child mortality but their impact is roughly the same among boys and girls, so that literacy among women is not a significant factor in explaining gender differentials across space. As suggested before, this relationship has to be interpreted with caution because the true underlying factor may be the degree of prosperity or development of a region that determines the level of female literacy.

(3) Work participation rates among women do not bear a significant relationship with levels of child survival. This is something we found earlier to be true in respect of inter-state variations. However, these participation rates are inversely related to excess male mortality across the districts of Andhra Pradesh. Districts with high levels of women's employment have low gender differentials in child mortality.

(4) Finally, as reflected in the significance of the regional dummy variable 2, the Telangana region has higher levels of female mortality and lower levels of male mortality (and therefore higher gender differentials) even after accounting for other factors underlying child mortality.

IV Discussion

How does one explain higher levels and narrower gender differentials in child mortality among working mothers?

One explanation – a straightforward one preferred by the Basus who consider some alternatives – is that (a) working mothers possibly do not have adequate time for child care and (b) work gives women greater confidence [] stemming from exposure to the outside world [and] changed values wrought by the awareness that girls are also potentially useful individuals'. They also refer in this context to the economic argument that in societies where women have an economic value, son preference will be weaker.

The Basus consider an alternative explanation: 'It may be that working women exhibit a more egalitarian sex ratio of child mortality not because they believe in and practice equal treatment but because they do not have the means in this case, primarily the time and the attention to discriminate more effectively against their daughters in favour of their sons'. They subject this argument to some testing and find it unsatisfactory. In my mind, however, this alternative explanation, restated in terms of the relationship between work and poverty, deserves further consideration.

Since we find that levels of child mortality are higher among working mothers everywhere in India, including in Kerala, it is obviously a trans-cultural phenomenon and the explanation has to be based on the distinctions between working mothers and non-working mothers. Now, what is common to all women workers in rural India is not only the fact that they do physical work away from home but also that they are all generally poor and, moreover, belong to the same class(es) of rural families: those of agricultural labourers and poor peasants and others engaged in non-agricultural activities. (It is true that some women from the richer sections of the peasantry also work and

TABLE 6. LINEAR REGRESSIONS OF CHILD MORTALITY RATES – DISTRICTS WITHIN ANDHRA PRADESH

Dependent Variable	Children Ever Born Per Woman (45-49)	Female Literacy (Per Cent)	Coefficient of Female Work Participation Rate (Per Cent)	Regional Dummy 1	Regional Dummy 2	R ²
Female rate	52.13* (9.61)	2.83* (0.67)	0.020 (0.076)	8.91 (10.12)	52.74* (10.81)	0.77
Male rate	41.59* (10.06)	2.49* (0.70)	0.060 (0.080)	14.43 (10.58)	-39.84* (11.32)	0.63
Excess male over female	-10.54* (3.31)	0.34 (0.23)	0.081* (0.026)	5.52 (3.48)	12.89* (3.72)	0.75

* Denotes statistical significance at the 5 per cent level.

are reported as 'cultivators'. They, however, constitute only a small fraction of the women workers.)

Work among women can therefore be closely identified with poverty and class status which remain fairly stable over time despite minor differences in the short period in incomes of worker families. In other words, labouring and poor peasant families remain poor in a sense more general than is implied in the income sense. Their class status as labourers and poor peasants is a durable one.

It is important to bear this in mind because the means for providing adequate nutrition and health care, apart from normal child care, may not vary much among the labour and poor peasant families, irrespective of (small) income differences and whether women work or do not (for whatever reason).

This identification of poverty of a lasting kind with working mothers enables us to see the narrow gender differentials in child mortality as the possible net result of a loss of the biological superiority of female children that attends poor nutrition and health care among the children of poor mothers. And of course the extreme poverty in families in which women work is itself a sufficient explanation for high death rates in such families.

In this context we may refer to an earlier study on sex ratio variations in relation to poverty [Krishnaji 1987]. The most remarkable finding of that study is that female to male ratios (FMRs) among agricultural labour and poor peasant households are far higher than among other rural families all over rural India. Sex selective (male) outmigration from the poor households may account for a part, but not the whole, of this large difference. Indeed the data show that the lowest female ratios are to be found in households with very large landholdings. Even in Kerala where the FMR is the highest in the country (over 1,000) the FMRs in the large landholding categories are significantly lower. These data are clearly suggestive of lower gender differentials in death rates in general (children as well as adults) among the poor families. And since the tendency is seen all over rural India, it is clear that the explanation must be found in poverty itself.

But son preference and the discrimination against girls is universal in India and it is not reasonable to assume that working mothers transcend this cultural inequity because of their 'exposure to the outside world'. What needs to be considered is the degree of discrimination since the universal gender bias is not simply a qualitative phenomenon. We do know that at the extreme it can take the form of infanticide

and it is unlikely that in well-to-do peasant families girls are neglected to the extent of being underfed. In very poor families in which food is in short supply and the means for taking care of sick children are practically non-existent such discrimination as can be practised may well be ineffective in securing greater chances for male child survival. The north-south cultural divide is however still relevant in understanding the spatial variations because we do know that in the north there is more discrimination. It is not possible to unscramble the data we presented earlier to arrive at relative contributions of the loss of female advantage in survival among children of working mothers and the net effects of discrimination against girls in respect of nutrition and health.

Likewise it is not easy to fully understand the positive relationship between female work participation rates and narrow gender differences in child survival across the states and the districts within a state such as Andhra Pradesh. This is because of the wide variations in conditions governing the work status of women even in poor families both at the district and state levels.

It is therefore inappropriate to jump to policy conclusions from the spatial

variations in levels and gender differences in child mortality. In particular, the prescription of providing women income-earning jobs at home to resolve the conflict between paid work and child care is not altogether sound because it does not take into account the fact that discriminatory practices against girls have deep cultural roots.

[This is a revised version of a paper presented at a seminar on Work, Culture and Politics: Women in Asia at the Maulana Abul Kalam Azad Institute of Asian Studies, Calcutta on August 17 and 18, 1995. It will be published later in the edited proceedings of the seminar. The author is grateful to the participants in the seminar for many useful comments on the earlier version.]

NEW AGE INTERNATIONAL PUBLISHERS

NEW

HAND BOOK OF

LOW COST HOUSING

A.K. LAL

In recent years there has been a growing emphasis on low cost housing to meet the shelter requirements of the growing millions in India. In this book, A.K. Lal makes an attempt to bring together the various issues related to low cost housing, including availability of funds, cost effective construction techniques, upgradation of slums and squatter settlements, rural housing scenario, etc.

This book should prove useful to students of architecture and engineering, as well as to economists and sociologists.

Film Studies, New Cultural History and Experience of Modernity

Ravi S Vasudevan

This analysis of the popular Bombay cinema starts with certain formulations about the audio visual in the age of mechanical reproduction, drawing upon insights about the importance of the reproducible image in constituting a new sense of the self. The cinema's extended circulation of images afforded a framework of subjectivity that was intimately related to other mechanisms of extended imagining and these formed the basis of a modern nationalist perception. Arguing against the idea that cinematic narration was engaged in a monolithic, unnuanced framing of this subjectivity, the author is concerned to understand the way mechanisms of narration turn back on the ostensible subject they construct to indicate the contradictory ways in which that subject is narrated. This analysis draws upon public discourses about the cinema to indicate the way reception was complicated by context.

IN this paper I focus on the study of film as a methodological issue in history and as a significant entry point into understanding the experience of modernity. My premise is that film or any comparable representational activity, is not an 'excess' that lies on the surface of 'reality' waiting to be peeled away or decoded in the drive to uncover the underlying, and more important, socio-political content. To invoke a term which has considerable currency, I am interested in the way the audio visual dimensions of cultural activity are *constitutive* of social perception and identity.

I have stressed the audio-visual dimension here because there is often a tendency to reduce the filmic to its non-medium specific narrative dimensions. This form of narrative analysis has nevertheless been important for exploring how an ideology, say of nationhood or modernity, may spread across a series of institutions and practices, binding them within certain epochal determinations. However, there are two problems with such an exercise. The first is that of understanding the process of narration, rather than in simply submitting a narrative to a certain ideological and political analysis which rests on an already established discourse. To mention just two of the most common, and important, such formulations, there is the emphasis on how popular film narratives subordinate women to patriarchal repression, and another on how the image of Hindu nationhood comes to exercise an authority over minority socio-religious formations. The problems arise here because, in certain versions of this analysis, these particular co-ordinates of nationhood in the cinema are often verified against a relatively remote set of constructions.¹ Even if such an analysis is carried into the 20th century, into the works of Hindu fundamentalists such as Savarkar, we still need to think about the problem of transferring such epochal formulations to specific periods and particular forms. About women, for example, one wonders about the status of certain modes of articulation, such

as devotion which are not straightforwardly assimilable to patriarchal discourse, and indeed tend to create an overflow effect in relation to it. The integration into film of representations of female modernity, such as that of the woman as a public-professional figure, has similarly problematic implications. Of course, patriarchally inflected narratives do try to resolve the conflicts which are set in motion by such changes in image: the question is how this is done at the level of narration, in the relay of subjectivities and views which makes up the filmic narrative.

Similarly with the communal construction of nationhood. Sudipta Kaviraj has pointed to how a nationalist interpretation of history has tended to underwrite a whiggist appropriation of social and political events, pressing them into a framework which anticipates or contributes to a triumphalist nationalism.² Anything which falls outside this framework is silenced. One wonders whether the recent concern about the fundamentalist dimensions of symbolic narratives has not been akin to seeing through the whiggist mirror darkly, the triumphalist nationalist narrative now replayed as the foreshadowing of a Hindu fundamentalist denouement. It has been well established that aspects of communal ideology emerged as a significant current amongst the intelligentsia in the latter part of the 19th century. But when such a configuration is analysed for D G Phalke, who framed his nationalist vision for the cinema on the basis of Hindu mythological images, are levels of discourse not being collapsed? In the case of Phalke, Kaviraj's 'fuzzy community' in which the nationalist ideal is evoked in terms of a familiar *gemeinschaft* or community, rather than as a self-conscious project with enumerative and exclusionary imperatives, is perhaps a more appropriate mode of description. 'I would suggest that the popular cinema was more expressive of a Hindu nationalist viewpoint after 1945. This was indicated in the way narratives were

structured: the development of a sensitivity in the industry to the dangers of Hindu alienation, and in the public reception and interpretation of the cinema.'³ I will indicate later how a symbolic narrative of the Hindu nation was put in place, one which rendered other identities subordinate to this privileged one. However, even if we notice the historical emergence of such a symbolic narrative, this does not mean that it is not revised and complicated from period to period.

CINEMA'S WORK OF MODERNITY

To refer to the title of a recent anthology on cultural studies in India, the study of the cinema amounts to an interrogation of modernity, as it was experienced in the Indian context. Cinema is centrally an institution of modernity. This is because at one level it is a machine engaged in the mechanical reproduction of images, and so has a fundamental impact on the way traditions of representation are refracted through its mechanisms. But it is also to be considered a vehicle of modernity in a social-institutional sense. As part of a regime of mechanical reproduction, it is participant in an expanded field of space-time relations. The cinema's generation of the reproducible image allows for its extended circulation, and with it, the possibility of an extended circulation of subjectivity.⁴ A new public sphere is heralded, constituting new horizons of experience. The image is now available to 'larger social aggregates' and within a significantly accelerated rhythm of communication. Copies of films may either be released simultaneously in a number of territories, as industrial parlance refers to the geography of the cinema, or with a minimum gap. There are, of course, hierarchies involved, between the metropolis and small towns or the 'interior', which determines the speed at which the film image is made available to a public.

The cinema's work of modernity here needs to be placed along with those other structures of imagining an extended space-

time of subjectivity that Benedict Anderson has pinpointed as the foundation of nationalism Anderson of course has referred to the importance of print capitalism, which through cultural forms such as the newspaper and the novel provided a new conception of a homogeneous open time. Through these forms the reader subject imagines the simultaneous existence and activity of other members of the putative nation.¹

Within these modern technological premises of the cinema it is important to register the particular way in which conventions of representation were refracted through the medium. In two significant essays Ashish Rajadhyaksha¹¹ and Geeta Kapur¹² have pointed to the way in aesthetics of frontality relayed through earlier visual and performative media interacted with the imperatives of realist ontology represented in the impact of oil painting, block printing and photography. The result was the generation of a particular mode of representing the national and the popular. Rajadhyaksha's analysis of Phalke's work argues that his negotiation of a new dynamic movement and spatial orientation is contained by recourse to the integrity of the frontal frame: all other spaces, actions and drives are ultimately subordinated to it.¹³ In this argument Phalke's practice of cinema within an indigenist swadhi idiom (one consciously adopted by the director) achieved a neo-traditionalising move that enabled a re-stabilisation of the viewing subject. Also relaying us through the field of the frontal, Geeta Kapur comes to a rather different rendering of its status in the notion of a living tradition. In her analysis of *Sant Tukaram* [Fatehlal and Damle 1936] the frontality of the performative devotional instance of the saint Tukaram seems animated both by the surrounding nationalist moment that of Gandhi and by the particular mode of acting of Vishnupant Pagnis as Tukaram in which he becomes the vehicle through which tradition and the historical moment speak. In contrast she suggests that Satyajit Ray's *Devi* (1960) deploys an analytic dramatic style that counters the iconic formulation of images: a field actually thematised and deconstructed by the film.

In these writers' understanding of the cinematic field and its constitution of the spectator's subjectivity the iconic frontal mode is especially of importance for the mobilisational quality that it evokes. The frontal address figures forth a certain imaginary space for the spectator that condenses a tradition on new technological terms: reformulating identity for him or her as unprecedentedly extensive. We need only think of the way an address was built around certain icons, such as that of salt or cloth, to understand the significance of iconic elements in the generation of a political identity.¹⁴

Let me qualify that none of these formulations suggest that these machines of modernity and their inflection of an indigenous address generated a standardised subjectivity. The end result was not the communication and absorption of a hegemonic national identity with inflexible socio-religious, socio-economic and gendered contours. Considerable ambiguity was generated in the cinematic narration of a modern national identity and also in the way the public perceived such narrational work. Both Rajadhyaksha and Kapur implicitly look to the moment of complication by focusing on the movement of the image: the way it threatens or actually opens out into more generous co-ordinates of social activity and signification. Implicit in Rajadhyaksha's work is the contradictory terms of a neo-traditionalist project: the way anachronism is built into the ambitions of recovery. The medium's phenomenal form constantly alerts us to the status of the frame: movement, light and texture in the refraction of the archaic and traditional.

I want to extend this analysis of the cinema in two directions. First, I want to suggest how the frontal mode is combined with what is called classical narrative: a character-centred analytic dramatic mode of story-telling. The Indian popular cinema inducted the codes of classical narrative from the American cinema to suggest that the story unravels through the awareness and experience of individual characters instead of only through the invocation of mythic and archetypal constructions founded on a frontal, iconic and tableau framing of narrative moments. But I also want to show how in another example, such as a narrational flow may constantly feed into a frontal performative and mobilisational form of address. I seek to control this textual analysis by reference to other information that was being circulated around the films concerned with a view to understanding the public sphere within which the cinema operated and the way spectatorial responses were shaped. In the process I hope to indicate that the terms of modernity and nationhood often deemed to be restricted to a dominant elite ideology suppressive of other identities may actually allow for a greater plurality of voices if we care to listen to them.

AMBIGUENCE OF MODERNITY

My two examples, *Achut Kanya*/ *Untouchable Girl* (Franz Osten 1936) and *Kismet*/ *Fate* (Gyan Mukerji 1943) are from the Bombay Talkies studio. This studio formed in 1934 represents a current quite distinct from the instances cited by Rajadhyaksha, largely from early Indian cinema, and the regionally inflected works analysed by Geeta Kapur. In many ways

amongst all the studio ventures of the 1930s, Bombay Talkies best prefigures the all-India Bombay cinema that emerged from the 1950s. As Rajadhyaksha has pointed out, Bombay Talkies consciously developed the star as a commodity value,¹⁵ someone who could be projected to sell a film, and with it a point of view. A contemporary review acknowledged that Devika Rani, as the untouchable heroine of the title, was too glamorously made up and clothed in the latter part of the film but overlooked these drawbacks in the light of the 'histrionic ment and sympathetic understanding' of the performance; the reviewer claimed that this role put Devika Rani at the head of India's screen stars which Garbo herself could hardly surpass.¹⁶ Indeed, in this account the way the star was distinguished at the representational level does not come across as a drawback: rather it provides for a spectacle of social pathos while also establishing India's capacity to produce a star-commodity that could compete at an international level. This careful fashioning of the commodity by the studio was followed through at the level of marketing and publicity. From the Bombay Talkies first film *Jawani ki Hawa*/ *Winds of Youth* (1935) onwards the publicity emphasised the modernity of the themes (individual choice in marriage)¹⁶ and treatment. A reviewer noted of this maiden venture that without unnecessary wrappings which often mar the first impressions of Indian pictures, *Jawani ki Hawa* brought the spectator straight to the central directive interest of the story.¹⁷ Further, the studio had Devika Rani come on the radio to publicise the film, underlining her disjunction as one of the first Indian ladies to broadcast on the short-wave length on the BBC and to give a television programme in London in 1933.¹⁸ The modernity of the woman as a highly public media personality was projected as an exemplary phenomenon inviting the special investment of women, presumably as role model. Devika Rani like other actresses of this period such as Sabita Devi attended special *zenana* showings of their films so as to meet with women audiences.¹⁹ The point of view relayed through the studio was then actively publicised as a modern one linked to a realistic aesthetic and a reformist ethos. It was also founded on a financially legitimate economic base; the studio at one stage boasting Sir Cowasji Jehangir, Sir Pheroz C. Sethna and Sir Richard Temple on its board of directors.²⁰ In these inaugural features of Bombay Talkies we can observe how commodity value, reformism and modernity are bound together in its enterprise. Indeed the commodity field constituted by star and studio may have been central to its articulation of the ideology of modernity.

the alienated aspects of the commodity form underline the distance between spectator and image, and motivate the desire to close the gap between the one and the other.

This phase is represented by the 1936 film, 'Achut Kanya', starring Devika Rani and Ashok Kumar. Its story is about the friendship between a brahmin, Mohanlal, and an untouchable railway signalman, Dukhiya, and the impossible, and finally tragic, love of their children, Pratap and Kasturi. The modern iconic resonances of the story are indicated in the film's working title, 'Level-crossing', a reference not only to the railway as a mode of transportation between places but also between social forms, as a democratising agent.⁷¹ The excerpt I refer to indicates the contradictory way in which this image is played upon in the narration and the ambivalent terms on which the filmic enterprise projected itself as part of the enterprise of modernity. The discussion centres on the film's use of parallel editing.

We need to recall here Anderson's thesis about the functions of simultaneity, that it effects a revision of the effective geography of our daily imaginative engagement, our sense of what lies within our space of knowledge and potential activity. The key cinematic incarnation of this new, industrialised relationship to time and space is that of parallel editing, the narrative device which encodes the convention that actions intercut between two different locales occur simultaneously. The resulting framework of simultaneity was not, however, a simple narrative equivalent of the newspaper report, the telephone conversation or the telegraph message. The recipient of this information about simultaneous events is not a figure in the story but the spectator. It is we whose horizon of perception is expanded.

What were the social and political implications of this new organisation of space and time? There are different ways of looking at this phenomenon. Stephen Kern⁷² has argued that it broke down traditional social hierarchies. He singled out the telephone in this radical transformation.

The telephone was incompatible with the aristocratic principle that certain persons by virtue of their position in society, have special importance. Telephones break down barriers of distance – horizontally across the face of the land and vertically across social strata.

Kern goes on to note that in 1913 the cinema was tagged a 'democratic art' because the camera eye penetrated everywhere, and because cheap admission prices and mixed seating arrangements brought the highbrow culture of the theatre to the working class.

Kern's formulations about the social effects of these media shifts are simplistic. For democratisation through changes in communications was only one possibility

amongst others. Obviously, communication through phones may still be restricted by the intercession of intermediaries. And his argument that the camera eye penetrates everywhere neglects the particular position of the cinema spectator. While the camera may indeed penetrate into a variety of prohibited spaces, in the fiction film this is only represented space, not the actual private arena say of palaces, or the secret rooms in which matters of state or criminal plots are discussed: the sanctum sanctorum of temples, the domain of bedroom and sexuality that is, all the types of space normally screened off from the public gaze. Even if through documentary film we were given access to such places, we would still not be entering them, defined as we are by a spectatorial distance from the event viewed.

Indeed we are singularly helpless in governing the events which we see on screen. Ironically this is a helplessness enhanced by the increased knowledge with which we are privileged because of the camera's omniscience. The knowledge accruing from an extended sense of the time and space of the action through parallel editing, and the relaying of information from different narrative locales, actually underlines our disablement.⁷³ Other alienating aspects of the extension of spatial and temporal awareness through the cinema are observable in the almost totalitarian aspects of camera omniscience in Fritz Lang films such as *Dr Mabuse* (1922) and *'M: A City Hunt for a Murderer'* (1932).⁷⁴ In *Dr Mabuse* the story telling emphasises the complete control exercised by one figure, the criminal Mabuse, in the mobilisation of characters in different spaces at the same time. Rather than our being given an awareness of different events taking place, it is one event, divided into specific functions, that unfolds before our eyes.

I would now like to turn back to 'Achut Kanya' to evaluate its use of parallel editing. The segment I have chosen follows directly in the aftermath of an attack launched by a brahmin noble, Babulal Vaid, on another brahmin, Mohan, because he has infringed caste norms by taking the untouchable signalman, Dukhiya, into his house. A distraught Dukhiya, anxious to get medical aid for the injured Mohan, safely negotiates his way through the mob *because they cannot touch him*. He rushes off to the rail-crossing, intent on stopping a train to get a doctor back to the village. Dukhiya waves down the train only to be reprimanded by the guard, who refuses to take him on board. Meanwhile the rioters set Mohan's house on fire. Dukhiya's attempt to board the train fails, and he falls to the ground, grief-stricken that he has not been able to help his friend. However, the train has communicated a message down the line, if not the one Dukhiya

had sent. Instead of a doctor, a 'darogha' of police arrives to investigate the riot, and subsequently a railway official arrives to dismiss Dukhiya for infringing his duty as signalman.

Inter-cutting between the events in the village and Dukhiya's frantic activities at the railway line, the segment constitutes an extension of space, a compression of time, and feelings of anxiety and helplessness in the spectator. The movement between spaces at the level of filmic narration runs parallel to the social problem which inaugurates the riot: the fact that the untouchable has been moved out of his house and into that of the brahmin, thus disturbing the imperatives of spatial and bodily separation which underlie the caste system. Clearly the train represents the possibilities of a further extension of this disturbance of traditional norms and spatial organisation, and therefore becomes a metaphor for modernity when it brings the police to the village. The police darogha will prove to be an ideal representative of modernity, for he completely disregards the hierarchies in the village and proceeds to arrest the brahmin leader of the riot.

Interestingly, two contradictions emerge from this description of the forces arrayed against each other. The sympathetic brahmin, Mohan, represents modernity within the village, both by going against caste norms and by advocating new forms of medicine, but he refuses to press charges against his attackers. Secondly, when Dukhiya runs for help, he goes to get a doctor, not the police. There is no indication from either of the film's sympathetic characters that they seek justice through the punishment of their oppressors. Going against the logic of the narrative's extension of the boundaries within which the action takes place, effected through narrative code, communication icon and the induction of an over-arching authority, the villagers' desire matters to be sorted out within the narrow confines of the village. Of course, action is taken by the police, modernity in a sense wins through, but it is a partial victory, for the essential caste distinctions continue to haunt the characters, leading to tragedy at the conclusion.

Modernity, in the form of the state, then remains outside the framework of the main action. Indeed, in the narrative's use of the train as a vehicle relaying knowledge and authority, there is an echoing of that authoritarian mastery over time and space which I had pointed to as one possible development of the revolution in communications. The authority communicated by the train has distinctly inflexible features, though of an order different from those of caste society. For the representative of the railway arrives to sack Dukhiya for failing to perform his duty. The law of contract enacts its own inhumanity and oppression, in a different

register from that of caste discrimination. The intrusion of the outer world is not only seen as alien and unacceptable in terms of the villagers' perceptions of right and wrong; it brings its own injustice, with it. We can only surmise that these signs of ambivalence towards the modern may have had something to do with the colonial and therefore alien and oppressive connotations of the state and its procedures. But this does not mean that the desire for the modern is abrogated through its political contamination. Rather, we need to think of different levels of modernity at the level of a thematic of unfulfilled goals, but also as a narrational strategy through which the spectatorial desire for the modern is evoked only to be disappointed. In this sense the sequence is marked by what can be referred to as a poetics of pathos, in which the knowledge, desire and vision of characters and spectators are integrated into narrational methods and narrative images which underline the classical pathetic trope of 'if only'. In a frame composed of the oncoming movement of the train with telegraph pole at its side, it is as if modernity is hurtling towards the spectator, only to fail to achieve a historic junction. We are left with an image of the poignancy of the desire for the modern, as the distraught signalman fallen from the train is comforted by his daughter as the telegraph pole looms ironically in the background.

WAYS OF NATIONHOOD

I now take, in example from *Kismet*, to show how certain narrative trajectories and modes of representation invite a series of different social and cultural positions for the spectator, complicating any monolithic understanding of nationhood and the modern public sphere. I will relate this analysis to non-filmic evidence which tells us about the circumstances in which the film was produced, the type of information supplied about it to a film-going public, and the way the film was received by critics and public lobbyists. In this latter context, I seek to understand how film was inducted into a public sphere of discussion about the perils of democratic developments in society, including medical discourses about the consequences of such changes. The representation of society in the film is a crucial reference point, though I will argue that it is the analysis of 'minor' characters such as the comic which may provide the most illuminating, if unconventional, point of entry into the historical reconstruction of social attitudes.

At the beginning of the segment I refer to, Shekhar (Ashok Kumar) has just been released from jail. While looking at a female performer on a float advertising a dance performance, he notices Bankey babu (V. H. Dasa), a petty thief, picking an old man

Babuji's pocket. Shekhar in turn steals from Bankey babu. Later, Shekhar accompanies the old man to see the pageant, 'Dur Hato e Duniyawalon Hindustan Hamara Hai'. The patriotic sentiments expressed by the song rouse the audience to fervour, and Bankey babu, who happens to be in the audience, takes advantage of the situation to pick the pockets of those carried away by nationalist feelings.

The war mobilisation sequence resonates with certain information about background of *Kismet*. Released by Bombay Talkies in 1943, the film provoked much speculation for it had been allowed several hundred feet more of raw stock than the permitted norm in conditions of war-time scarcity. Amongst the possible explanations for this indulgence was the induction of the war mobilisation sequence into the film, although the bulk of the film has no overt reference to the war. Despite the apparent complicity of Bombay Talkies with the government in this context, publicity releases and filmic address undercut any such straightforward identification. The publicity releases emphasise only the romantic aspects of the plot. And the film addressed the spectator on several different planes, amongst which references to the war are associated with a defence of the Indian nation.⁶

The song 'Dur Hato e Duniyawalon' is structured in such a way that the ultimate enemy, the Germans and Japanese, are only identified towards its conclusion, skirting any British linkages in the war effort. Second, the way the film addresses us in the different segments of the performance suggests that the identity offered the spectator undergoes several significant shifts. Whereas soldiers dressed in uniform offer us the first point of identification, in the next tableau the common citizenry, both men and women, are inspired by a multi-communal cultural reference, the defence of temples, mosques and gurudwaras. The third tableau is the most significant, because the alternation between state and citizenry is now condensed into a single tableau: soldiers inspired to defend India, no longer represented in the common citizenry but in the figure of a female deity who stands in front of a map of India. The iconography of this figure retains traces of *durga*, as she holds a trident in her hand, but otherwise lacks the other features of this goddess. Nevertheless, it is clearly Hindu in its derivation. In the last tableau, then, the multi-communal citizenry is transformed into an essentialist cultural representation, a Hindu invocation of nationhood. Editing patterns in this tableau invite us to shift our attention from the larger framing of the soldiers surrounding the female deity to a medium-shot of the deity, the soldiers' voices now reduced to a presence on the sound track. Perhaps we have, in this

shifting field of address and iconicity, an invitation to the spectator to immerse him or herself in a patriotic emotion which displaces the ambiguities of the colonial state's war effort and puts that effort in a culturally more identifiable and therefore more acceptable perspective. However, I would suggest that there are other ideological functions at work in this sequence. After all, the multi-communal imagery of Indian citizenship and nationhood is finally replaced by, or condensed into, the unitary figure of a deity of Hindu origin. If the spectator is being mobilised to identify with the war effort, it is finally as an Indian who has sublimated the varieties of identity which that nation has condensed into one overarching Hindu imagery of the country.

Kismet is centrally a story about the hero's loss and recovery of family identity. This is a larger narrative convention of melodrama, and of the Indian popular cinema in particular. The disturbances inaugurated by the loss of his familial identity precipitates the hero into a life of crime. At the time, film periodicals, public lobbies and juvenile magistrates were mobilised to argue that the film tended to glorify such aspects of theft. The strident tones of contemporary opinion about the so-called immorality of the film indicates that it had touched a raw nerve in the straitened economic circumstances of war-time life. There were two related terms on which anxieties about the immorality of the popular crime film was expressed. Film journalists and the wider public charged that the crime would exert an 'evil influence' over the lower classes and children. The effects on these groups would in turn influence the character of the nation.

About *Kismet*, the film periodical *Filmindia* remarked:

The fact that the thief in the picture happens to belong to the higher strata of society does not take down his criminal role. On the other hand it makes it all the more attractive, all the more respectable and all the more imitable. Now is this the kind of nourishment that builds worthy citizens and a great nation?⁷

However, while the film does indeed indulge the pleasures of seeing its hero easily overcome economic obstacles through theft, it is finally quite moral in the way it places him back in respectable society and corrects the immoral actions of the father which alienated him in the first place.

Counter to this normalising current, the sequence I have shown points to a more appropriate focus for contemporary middle-class fears, but one which is suppressed by the narrative. The theatrical performance in 'Kismet' concludes on the image of a little man enthusiastically picking the pockets of an audience distracted by nationalist fervour. This character, Bankey

babu, played by the comic V H Desai, is a petty thief, and also a servant of a wealthy family. Bankey babu is quite important to the narrative, because on two occasions he is involved in thefts of objects which the hero appropriates. For Bankey, these are thefts pure and simple, whereas for the hero, they lead him to meet people and fulfil objectives which serve to underline the moral drives of the story.

Bankey babu, servant and thief — in this figure we have a socially appropriate focus for middle class anxieties about crime in 1943. And yet *Kismet* suppresses his story in favour of the more acceptable narrative of nationalist inspiration, familial re-location and class reproduction which is the hero's underlying trajectory. In this regard, I would argue that the analysis of minor characters and narrative by-ways as represented in the comic sequences may be profitable. Indeed, they may alert us to the more commonplace material and anxieties conjured up by the social types they represent, a material which is displaced and worked over by the larger operations of the narrative.

These anxieties about the effects of democratic developments in society are echoed in various discourses about the functions of the cinema in public life at this time. One of these is the medical discourse about the cinema's presenting a public health hazard, expressed in a short book written in 1946 by G D Srivastava, a doctor from Lucknow.²⁸ At one level we may assume that the good doctor was genuinely concerned with the hazards inherent in any public gathering within an enclosed space, as the following remarks will support:

Knowledge of the normal bacterial content of the oral and upper respiratory tracts is very essential to enable us to properly appreciate the dangers which all of us have to face whenever a large number of people gather together particularly when the atmosphere is closed and congested as it is inside a cinema hall.²⁹

Indeed, Srivastava details an impressive array of ailments in his prognosis of the ills the cinema could inflict on society.³⁰ To situate his scenario properly, we would need to examine the kinds of health hazard he has mentioned not as a specific problem of the cinema but as one generated by problems of urban public life. In isolating the cinema as the source of various contagious diseases, the writer presents us with a distorted, and somewhat hysterical, point of view. Clearly, there is more at stake than just public health. The dangers of the cinema are centrally those of the contamination of class and of sex.

Echoing attitudes to the representation of sexuality in the cinema recorded in the Indian Cinematograph Committee reports of 1927-28, Srivastava warned of the effects of the

depiction of European mores in love and romance. He went on to picture a range of moral and bodily dangers threatened by interaction with women in the cinema halls. For our purposes here I will refer to the class dimensions of his anxieties. The most pervasive source of danger presented by the cinema is that of class, and the central source of disease in the cinema is poverty. Thus reflecting on the possibility of plague being communicated through the cinema, Srivastava notes that most of the people 'who have been frequently on foot in the plague infested area usually belong to the poor and middle classes. Hence their feet are very likely to be naked. Moreover they throng in the lower classes of cinema owing to cheapness.'³¹ Infection here comes from the bottom of the cinema upward. In another instance, the queue becomes the medium of danger. Referring to skin diseases, the author notes how scabies attacks "webs and sides of fingers and the folds of wrist joint. When there is a rush at the windows of the lower classes of a picture palace, these parts come in very intimate contact during the purchase of tickets."³² In all these paranoid projections, the cinema becomes a veritable cauldron of bubbling disease, represented in the most vivid and bigoted terms by the image of the 'unclean woman' and the itching barefoot underclass. These fears are related to a question of the contingent and the distant.

The sources of infection in a particular gathering may be only a few in number, but they are always present, and are of a definite menace not only to their immediate neighbours, but also to the people sitting quite far from them.³³

In a peculiar sense, the sources of danger may be as remote, or indeed as imaginary, as the distant flow of actions and scenes on the cinema screen. We could say that the sources of threat for the male, upper-class filmgoer are located at an equally imaginary distance from him, whether they are on the screen or in the audience.

In this account of the public discourses that developed around *'Kismet'*, or which were more generally prevalent at the time, we are given a view from a middle class position which suggests the anxious areas in visions of nationhood and democracy. Unfortunately, we cannot easily recover the 'other side' and have only suggested what another public for the film might look like. A reading of *Kismet* against the grain leads to the hypothesis that this public might bear a healthy survivor's scepticism for nationalism and the terms of a rather paranoid middle class public discourse conjures up an image of this other public as having acquired a certain weight in the street, around cinema halls, and in the broader spaces of public life. The particular stridency of the critics may have been fuelled by the sheer

visibility of the masses as they coursed around the film. For it is worth recalling that *'Kismet'* ran for a record 186 weeks in the Roxy Theatre, Calcutta. I would suggest that our evaluation of the address of popular cinema needs to be complemented by such information, an approach which integrates an account of the polyphonic textual constitution of the spectator along with his or her broader public articulation.³⁴

Notes

[This paper was presented at a seminar on 'Terms of Modernity' at the Indian Institute of Advanced Study, Shimla, May 1994. I would like to thank Radhika Singha for her comments.]

1. Thus Somnath Zutshi has analysed the contemporary Bombay cinema in the context of tendencies emergent in the 19th century in the writing of such influential figures as Bankim Chandra Chatterjee and Rabindranath Tagore. Somnath Zutshi, *Women, Nation and the Outsider in Contemporary Hindi Cinema*, in Tejswini Niranjani, P. Sudhir and Vivek Dhatshwar (eds), *Interrogating Modernity: Culture and Colonialism in India*, Scullin, Calcutta, 1993, pp. 83-142.

5. Ibid. pp. 53-55, for the notion of 'fuzzy' and 'enumerated' communities. Kaviraj has written sensitively about the difficulties of formulating a new language to go along with the new experiences and determinations of modernity in this essay. [Bankim] shifts from an old to a new identity but very weakly, though he provides the rhetoric for this in the form of 'vande mataram', but it remains old poetry in Marx's sense. But it is hasty to condemn people like Bankim too easily for the task has not been performed even today. Even now we do not have a language except English, which can speak this new poetry, because it is no less than the task of forming a new language. (p. 31).

8. Drawing upon and extending Walter Benjamin's 'The Work of Art in the Age of Mechanical Reproduction', R. Srivatsan has written of the importance of the reproducible image, the positioning of the object in all its dimensions, is crucially effected by

reproducibility. In addition as a dual of this effect on the object the constitution of the viewing subject in terms of her conceptualisation of truth pleasure desirability her practices as they follow out of this changed conceptualisation and the way she experiences herself because of her changed practice and way of seeing are all subtly but irreversibly altered.

12 The anxieties that we pass on to the spaces that we do not actually see but know the spaces in graphic terms that surround the frame finally concern our responsibility as the producers of what happens before us. Narrative necessarily means in what I have earlier called the back and forth of the gaze and the object viewed a continuing projective identification into the site of the crisis. It means a wishful fulfilment of appropriating the happy ending realised by external intervention (God/us) that finally places us back at the frontal helm. Rajadhyaksha, The Phalke Fra p 80

13 For an interesting point about how the market place provides another framework of knowledge and activity for the imagining of the wider community an arena in which a swadeshi commodity imagery is especially important see Satish Deshpande, Imagined Economies: Styles of Nation building in Twentieth Century India, *Journal of Arts and Ideas* Nos 25-26 December 1993 pp 5-35. However Deshpande's larger argument seems to me to require further analysis. This is that there has been a delinking of nation and economy in the imaginary process of nation formation after Indian financial policy has integrated India into processes of globalisation.

23 In an excellent article on the cultural reception of the telephone as represented through parallel editing in early American cinema Tom Gunning has shown how the new perceptual dimensions inaugurated by the telephone could have traumatic rather than empowering implications. He analyses a narrative in which a husband is separated from his family this is the parallel editing and is made aware of an impending attack on them when his wife rings him. There are different versions of the

narrative one which emphasises the process of communication and its interruption when the telephone wire is cut by the burglars and another much starker one in which communication is maintained only to underline the husband's distance and helplessness. The wife is stopped in her conversation but the phone is left off the hook forcing the husband to hear the sound of her being strangled by the burglars. The traumatic fact that communication is predicated on distance and is ever susceptible to breakdown is here underlined in the use of parallel editing allowing us to see the action in both places but leaving us as distant and as helpless as the husband Tom Gunning, Heard over the Phone: The Lonely Villa and the de Lorde Tradition of the Terrors of Technology, *Screen* Volume 32 No 2 Summer 1991 pp 184-96

24 In the first sequence of Dr Mabuse information which the criminal mastermind will use to manipulate the stock market is stolen through a carefully co-ordinated plan. On three occasions three characters consult their watches in three different places the editing emphasising the quasi-simultaneity of the events. Again we are invited to pay attention to actions in a series of different locations linked together in time and in this case by a co-ordinating intelligence in the story. The dispersion of narrative is actually functionally integral made sense of because of Mabuse's overarching control. Within the story too Mabuse exhibits attributes that confirm this power. His ability to hypnotise people renders them subject to his commands. Not only does he take over people he becomes different people taking on a series of disguises which allow him to penetrate different spaces.

Such attributes sound uncannily like those pointed out by Kern in his evaluation of the effects of changes in time-space conceptions. Mabuse's operations are oriented to amassing wealth but there is no doubt that his particular target is the aristocratic Count Wenck whom he degrades through hypnosis into the ranks of a rambling cheat and whose wife he kidnaps. However this penetration of space and the

destabilisation of class does not signal a democratic development. It heralds the inauguration of a mass society, in which the deployment of people in space and time is integrated into a common enterprise overseen by an omniscient authority. Mabuse suggests that Lang displayed the insight and indeed the anxiety that the changes in the conception of space and time under industrial capitalism of which cinema was emblematic — heralded a universal authoritarian version of the social organism.

Unemployed and Self-Employed Job Preferences and Employment Perspectives

E T Mathew

In an earlier paper, the author argued that a major factor contributing to the growth of educated unemployment in Kerala is the preference for salaried employment, especially in the public sector and aversion to self employment among educated job seekers. This paper, based on survey data, explores in more depth the question of preferences of the educated unemployed in Kerala

THIS writer had argued in an earlier paper (EPW, February 11, 1995) that one of the major factors contributing to the rapidly growing educated unemployment in Kerala is the prevailing preference of educated work seekers for salaried employment, especially in the public sector, and their implicit aversion to self-employment. Though there has been some improvement in the self-employment situation in recent years, its growth has not been rapid enough to absorb a large enough proportion of the annual addition to the educated labour force. It was further pointed out that as the NSS data on self-employment used in the study did not draw any distinction between the educated and the non-educated self-employed, we are unable to attribute the recent increase in self-employment to any distinct reversal of job preferences on the part of educated work seekers. This paper emphasised that job security coupled with largely seniority based promotions are responsible for making educated work seekers prefer salaried employment in government.¹

The present paper is a sequel to the one referred to above. Instead of simply asserting that the unemployed in Kerala invariably prefer regular salaried/wage employment to self-employment, an attempt is made to provide an empirical basis for the assertion. The data for the purpose have been collected through a limited household survey carried out during 1993. The survey was conducted in Trivandrum district of Kerala, the sample consisting of 810 households: 540 rural households spread over four panchayats and 270 urban households represented by two municipal towns and Trivandrum corporation.² It may be pointed out that while NSS data do provide alternative estimates of employment and unemployment for rural and urban households as well as for male and female labour force, based on current daily status, current weekly status and usual status, several interesting aspects such as the socio-economic background of the employed and the unemployed, job preferences of the unemployed, and obstacles to and factors motivating self-employment, are not touched upon. This paper is a modest attempt to examine some of the questions

which are not normally highlighted in the NSS or other official reports. Because of the obvious constraints in undertaking a statewide survey, the present sample survey had necessarily to be limited to one district, namely Trivandrum. While it is readily admitted that socio-economic conditions in the state vary from district to district, the results of our survey are broadly applicable to the entire state.

A warning seems to be in order at this point. This paper does not attempt to provide any estimates of employment/unemployment on the basis of the sample survey. Anyone looking for such estimates still has to depend on the most comprehensive and systematic estimates provided by the National Sample Survey Organisation from time to time. The focus of the present exercise is altogether different. It has a two fold objective: (1) it examines whether there is any empirical basis for the commonly held view that the educated in Kerala prefer salaried employment (white collar occupations) to self employment, and (2) granted that fewer persons, particularly among the educated, prefer self employment, the paper examines what motivates them to opt for self employment. While attempting to throw light on these two main issues, we also discuss in the process a few related questions such as the types and terms of salaried employment sought, including sector and place of work, types of self employment opted for, levels of earnings corresponding to each type, and rural/urban and gender differences observed in each case. It is probable that our sample is not fully representative of the poorest of the poor among landless agricultural and non-agricultural labour households and slum-dwellers. This need not, however, be considered a limitation of the study in view of the fact that our focus is on job preferences of the unemployed and employment perspectives of the self-employed, and not on the employment problems of wage labour, which may consist of a few illiterates but mostly of persons with levels of education below SSLC (i.e. outside the 'educated' category). The overall employment/unemployment situation as shown by the sample survey is given in Table 1.

I Job Preferences of the Unemployed: Type of Employment

As is well known, the rural/urban divide is far less pronounced in Kerala compared to the rest of the country. Nevertheless, we shall retain the distinction in our analysis. Job preferences with regard to type of employment as shown by the sample survey is presented in Table 2.

Leaving aside the 'no preference/any job' category of work seekers for a moment, it is interesting to observe that there is a broad similarity in the types of job preferred by the rural and urban unemployed in our sample. In fact, the ranking of the type of jobs preferred by the two groups is the same for the first six types mentioned in Table 2, though of course the proportions vary. Clerical job seekers form by far the largest category, there being no close second at all. Out of a total of 333 job seekers, 30.6 per cent preferred clerical jobs while 14.1 per cent sought teaching jobs. This difference in job preference is more or less maintained between rural and urban job aspirants: 28.5 per cent and 11.0 per cent, respectively, for the rural job seekers and 35.2 per cent and 20.9 per cent, respectively, for the urban work seekers. Gender differences in job preferences, however, are sharper compared to rural/urban differences. Relatively speaking, more female job seekers among both rural and urban unemployed prefer clerical jobs compared to their male counterparts. However, there is no such symmetry regarding preference for teaching. While among the rural unemployed only 10.3 per cent of the female work seekers preferred teaching, the percentage in respect of male job seekers was higher at 12.1. In

TABLE 1. LEVELS OF EMPLOYMENT AND UNEMPLOYMENT IN SAMPLE SURVEY

	Rural	Urban
Number of sample households	540	270
Population of sample households	2454	1151
Average size of households	4.54	4.26
Total number of employed persons	912	505
Total number of unemployed persons	228	105

sharp contrast, among the urban job seekers, the proportions for male and female work seekers were 16.3 per cent and 24.2 per cent, respectively. The relatively high proportions of urban female unemployed opting for clerical and teaching jobs is a clear indication of the extent of educated unemployment prevailing among the urban female labour force. In our sample, about 63 per cent of the urban female unemployed opted for clerical and teaching jobs, while the corresponding proportion for the rural female was only 41 per cent.

The predominance of clerical jobs as a preferred category of employment, among both rural and urban work seekers as well as male and female unemployed, is partly explained by the fact that most of the aspirants do not possess any particular skills besides their general education. Given this scenario, clerical jobs are the most feasible form of employment. This aspect is brought out in Table 3.

Over 60 per cent of the rural unemployed and over 55 per cent of the urban unemployed looking for clerical jobs were either graduates or postgraduates without any vocational qualifications. Another 9 per cent among the rural and 16 per cent among the urban unemployed are either undergraduates or non-matriculates. Only the remaining - 19 among the rural unemployed forming 29.3 per cent and 10 among the urban unemployed forming 27 per cent - had any vocational training. As between the rural and the urban unemployed aspiring for clerical jobs, there were more postgraduates and fewer vocationally trained persons among the urban compared to the rural unemployed. The vocational qualifications, of course, consisted of trades/skills as diverse as typewriting, ITI training, pharmacy, laboratory technician course and computer programming. We may add that among those without any vocational training, a small proportion had first or second class degrees to their credit; among the rural unemployed seeking clerical jobs there were 18 bachelor's degree holders and five master's degree holders, with first or second classes, the corresponding figures for urban job seekers being 11 and five, respectively. Before proceeding further, a possible misunderstanding of the role of vocational training needs to be removed. Our observation that the majority of the unemployed job seekers looking for clerical jobs did not have any vocational training should not be misconstrued as indicating that vocational training is an essential qualification for appointment as clerks. What we have tried to emphasise is the fact that those searching for clerical jobs is a residual category. Anybody possessing vocational training has much better chances of being already employed in the concerned fields. Hence all those who have no vocational

training will be naturally queuing up for clerical jobs. And their number being so large, all of them cannot immediately find employment. (Of course, even all of the vocationally trained persons may be unable to find jobs since the number of relevant jobs available is insufficient to absorb all the trained persons.) This is typically the situation that is found in Kerala.

Next to clerical jobs, teaching is the most preferred form of salaried employment sought by the unemployed in our sample. Twenty-five persons (11.0 per cent) among the rural unemployed and 22 persons (21 per cent) among the urban unemployed in the sample have opted for teaching. However, compared to the clerical category, the

numbers involved are much smaller, mostly due to the fact that entry requirements are much stiffer in the teaching profession (parallel colleges and coaching centres not considered!) A degree or certificate in education is generally required for appointment as teachers in schools, in addition to the appropriate level of good general education, while for teaching at the college/university levels a first or high second class master's degree is the minimum requirement. Often one needs a research degree in addition.

Obviously, our sample of aspirants for teaching jobs consists of far more qualified persons compared to those looking for clerical jobs. In a sample of 47 job seekers, both rural and urban, only four (8.5 per cent)

All	65 (100.0)	37 (100.0)	102 (100.0)

Note: Figures in parentheses refer to percentages.

were third class degree holders. Even so, the chances are that many of them would have dropped out of the race for teaching positions after some time.

In regard to the job preferences of the rest of the sample of unemployed, we do not have any sizeable numbers preferring any particular job. They consist of persons who look for the salaried employment for which they have had the appropriate vocational or professional training as, for example, in the case of engineers, doctors, typists/stenographers and agricultural officers.

There is, however, one final category among the unemployed in our sample who have reported no preferences and are prepared to accept any job. This 'no preference/any job' category is a strange assortment of unemployed persons with general education varying from below SSLC to postgraduation. The vast majority of them, however, consists of undergraduates and third class graduates. If at all they have any vocational or professional qualifications, they belong to a lower level such as III certificates tailoring, music, typewriting, etc. skills of which, relatively speaking, there is no dearth in Kerala. We also observe that among the 'no preference/any job' category there are relatively more rural (84 persons forming 37 per cent) than urban (24 persons constituting 23 per cent) unemployed. It thus appears that the 'no preference/any job' attitude on the part of the job seekers is more a rural than urban phenomenon (Table 2). The relatively wide variety of jobs existing in the urban sector may be one plausible reason for this difference. The frustration caused by long waiting periods already undergone, as we shall see in a moment, may be yet another contributory factor. As for gender differences, while the proportions of male and female job seekers prepared to accept any job are roughly equal among the rural unemployed (37.4 per cent and 36.6 per cent respectively), the proportion of male job seekers in the category is twice as high as that of female job seekers (32.6 per cent and 16.1 per cent respectively) among the urban unemployed. This would indicate that urban female job seekers, who are generally more educated than their rural counterparts, are more selective regarding type of employment. More about this later. We present in Table 5 the educational profile of the 'no preference/any job' category of job seekers in our sample.

As already noted, the 'no preference/any job' category consists of relatively poorly qualified job seekers. Out of a total of 108 unemployed falling in this group, 57 persons constituting 52.8 per cent, were either non-matriculates/undergraduates or third class graduates/postgraduates, without any vocational or professional training. Naturally, the proportion of such 'less qualified' job

seekers' was slightly higher among the rural (53.6 per cent) than among the urban unemployed (50 per cent). The employment prospects of this group are further dampened by the fact that even the vocational/professional training some members of this group have had, is very common place. Given these factors, their predicament is unenviable. It is thus likely that having remained unemployed for long periods, they no longer give any more thought to the type of job. We note that the average waiting period of the rural unemployed in the 'no preference/any job' category was 7.5 years and that of their urban counterparts 4.7 years at the time of the survey. Quite expectedly, the sense of frustration or despair, which led many job seekers eventually to give up their preference for any particular type of salary and employment, has also made a very significant proportion among them, both rural and urban, agreeable to accept employment for any salary in any sector or anywhere (Squire, 1981:123). In fact, some among them have absolutely no preferences whatsoever.

It is interesting to note that among those unemployed who are prepared to accept any job, the degree to which they are willing to compromise on minimum salary and sector and place of employment varies considerably. While well over 80 per cent of the rural and urban unemployed in this group are prepared to work in any sector, those who

are willing to give up their minimum demands regarding salary is far less—only 36 per cent of the rural and 13 per cent of the urban unemployed in the 'no preference/any job' category. As far as place of employment is

TABLE 6. DISTRIBUTION OF JOB SEEKERS IN 'NO PREFERENCE' CATEGORY BY OTHER PREFERENCES

Type of Preference	Number of Job Seekers

The United Western Bank Limited

Regd. Office: United Western Bank Building, 172/4, Raviwar Peth, Shivaji Circle, Powai Naka, SATARA - 415 001, Maharashtra
Tel: (02162) 31418/31513 Fax: (02162) 31884

ISSUE OF 1,80,00,000 EQUITY SHARES OF RS. 10/- EACH FOR CASH AT A PREMIUM OF RS. 30/- PER SHARE AGGREGATING RS. 72.00 CRORES, ON RIGHTS BASIS TO THE EXISTING SHAREHOLDERS.

HIGHLIGHTS

- Premier Regional Bank in Maharashtra with a rich heritage – founded in 1936 by "VIMA MAHARSHI" Annasaheb Chirmulay.
- Professional Management – Board comprises of people with expertise in diverse areas.
- Scheduled Commercial Bank in the Private Sector with uninterrupted dividend paying record for the past 56 years.
- Among private sector banks having Registered Office in Maharashtra, the Bank enjoys prestigious premier position in respect of deposits, advances, profits and number of branches.
- The bank has achieved aggregate deposit growth of 29.71% and aggregate advances growth of 45.30% in the year 1994-95, which is well above the industry growth rates.
- Financial sector reforms have opened up new vistas for growth.

RISK FACTORS

- **Interest Rate Risk:** Present interest rates on deposits and advances which are based on the directives of the Reserve Bank of India, are likely to be market driven due to deregulation and thereby may result in increasing pressure on spread and affect profitability.
- **Lending Risks:** The clients financed by the Bank could be affected adversely due to unforeseen political, economic, social and financial factors. This could adversely affect the profitability of the Bank because of delay/default in repayment by these clients.
- **Changes in Government/RBI Policies:** The operations of the Banking Industry are subject to regulation by the Government/RBI and hence, are liable to be affected by the changes, if any, in Government policies from time to time.
- **Competition Risks:** Severe competition due to permission to set up new Private Sector Banks, increasing disintermediation and other reforms in the Financial Sector.
- **Disintermediation Risks:** As the financial markets mature, the trend towards disintermediation would be increasingly in evidence. In such a scenario, many companies may access the Capital and Money Markets for their needs and reduce their direct dependence on the banking system. This may have an adverse impact on the level of deposits and also on the level and mix of the advances portfolio and the profitability of banks.
- **Outstanding Litigations:** There are outstanding litigations amounting to Rs. 240.40 lacs (a total of 42 cases) for "Claims against the Bank not acknowledged as debts". These claims are not likely to affect the operations and finances of the Bank.

RIGHTS ISSUE OPEN

concerned, while only about one-third of the rural unemployed are prepared to work anywhere the corresponding proportion of the urban unemployed is almost one-half indicating that the urban unemployed are more willing to move away from their home-base in search of employment. And finally, among the unemployed job seekers who are prepared to accept any job, only 16 (19 per cent) of the rural unemployed and two (8.3 per cent) of the urban unemployed are willing to work for any salary, in any sector, and in any place. Our data show that these persons are comparatively less qualified compared to the rest in that group.

It is observed that one-half of the rural unemployed in the 'no preference' whatsoever group in our sample are either matriculates or below. The remaining consists of one-third class arts graduate and seven undergraduates with vocational training such as laboratory technicians, ITI and type writing. The urban unemployed in this group is represented by two MAs, one-third class degree holder and another having training in music.

II

Job Preferences of Unemployed: Minimum Salary Sector and Place of Employment

We have discussed in the preceding section the type of jobs most preferred by the unemployed rural and urban in our sample and noted that clerical and teaching jobs are the most sought after. We also noted that a sizeable proportion of the unemployed, presumably out of frustration or despair caused by long waiting periods already undergone, are ready to accept any job. It should, however, be emphasised that type of job is only one dimension of individual preferences regarding employment. Among the other dimensions, we may note the minimum salary demanded and sector and place of employment.

Minimum Salary

According to the results of our sample survey, the vast majority of the unemployed, rural as well as urban, have indicated their minimum salary. Obviously, the minimum salary expected is dependent on the type of job they are seeking which, in turn, is determined by the qualifications of the unemployed. Professionally qualified unemployed such as doctors and engineers naturally expect higher salaries compared to work seekers looking for teaching and clerical jobs. While most of the unemployed in our sample have indicated the minimum salary they would accept, there are some who either have not responded or have expressed their

readiness to accept any salary. The willingness to accept any salary, as in the case of the willingness to accept any job, may be interpreted as an expression of their frustration caused by long waiting periods or of the urgency for employment arising from family circumstances. The relevant data for the sample are furnished in Table 8.

It is seen that consistently a larger proportion of the female compared to the male unemployed insist on a minimum salary as a precondition for employment. While for the rural unemployed the proportions are 78.3 per cent for males and 84.1 per cent for females, they are 95.3 per cent and 98.4 per cent respectively for the urban unemployed males and females. Correspondingly a smaller proportion of the female unemployed are agreeable to any salary that may be offered. Thus it appears that although the rate of unemployment is higher among educated female work seekers, there is relatively less despair on their part. This can be explained by the fact that not being the main breadwinner of the family in most cases, the educated female unemployed are under less pressure to get an immediate placement. Average minimum salaries expected by the unemployed in the sample are presented in Table 9.

The above results show that the female unemployed are willing on average to accept employment on a lower salary. This is true of both rural and urban female job seekers. Their relatively lower reservation price may be partly due to wider unemployment among the educated female labour force. Another reason may be that unlike in the case of labour households, educated female job seekers, while greatly valuing economic independence, do not expect to be the main breadwinners in the family. Besides, they are subject to various constraints regarding sector and place of employment as they are not prepared to work for any employer or in any part of the state or country. Under these circumstances it is quite logical that female job seekers look for the least disadvantageous combination of job parameters, namely salary, sector and place of employment.

Sector of Employment

Apart from searching for jobs which are in broad agreement with the type of employment and the minimum salary of their choice, job seekers also attempt to exercise their preferences regarding sector of employment such as, for example, state and central governments, public and private sectors and banking sector. The preference pattern of job seekers in our sample with regard to sector of employment are presented in Table 10.

It is seen that roughly one-half of the job seekers rural and urban have no preferences regarding sector of employment. As for rural-urban differences, it is found that while the proportion of those who have expressed no preferences regarding sector of employment is larger among the rural unemployed, that of those looking for government and banking jobs is larger among the urban unemployed. Rural-urban differences apart, one thing is very clear: the preference pattern of the unemployed has a distinct bias in favour of public sector employment in the broad sense.

Coming to gender differences, the proportion of those having no preference at all in respect of sector of employment is lower among female compared to male unemployed rural and urban. Apart from this, there are no consistent gender similarities or dissimilarities in the preference pattern relating to sector of employment.

Place of Employment

Mobility of labour is an important factor influencing the volume of employment. In a well-integrated economy where people are free and are willing to move spatially from one part to another and from one occupation

Note: Figures in parentheses refer to percentages.

to another, the extent of unemployment is likely to be relatively less.¹ It will therefore, be interesting to examine the preferences of the unemployed with regard to place of employment.

Comparing rural and urban job seekers in our sample, it is seen that roughly the same proportions (65.8 per cent and 67.6 per cent respectively) prefer to remain within the state. However, a distinctly higher proportion of the urban unemployed (29.5 per cent) prefer employment within the district (i.e. in Trivandrum city or its suburbs) in contrast to the rural job seekers (19.3 per cent). This may be due to the fact that urban job seekers, being accustomed to the urban life style, are less inclined to move to any part of the state in search of employment. Gender differences in this respect are much sharper. While only 4.8 per cent of the rural and 4.6 per cent of the urban males among the unemployed prefer to be employed within the district, the corresponding proportions for female job seekers are 27.6 per cent and 46.8 per cent respectively. It is thus evident that one of the factors aggravating unemployment among female work seekers is their strong preference for employment at places as close to their homes as possible. In fact, the relative immobility of women has been pointed out as a major factor influencing labour markets in low income countries by many researchers [Rosenzweig 1988:743].

The preference of female job seekers in Kerala to secure employment close to their homes is understandable. In the rest of the country this preference must be even stronger in view of the fact that generally women here are far less educated and also less mobile. However, such a preference is fraught with serious implications for the employment situation in Kerala due to the operation of certain factors peculiar to the state. (1) The foremost among such factors is the unique sex ratio in Kerala's population. According to the 1991 Census, the population of the state consisted of 142.30 lakh males and 148.02 lakh females leading to a sex ratio of 1,040 females for 1,000 males [Samuel 1991:91]. (2) Because of the rapid growth of female enrolment at the secondary and university stages of education in Kerala, the proportion of educated women in the total population has been growing at a fast pace. A good proportion of the educated females eventually join the labour force. Out of a total enrolment of 1.54 lakh students in the three affiliating universities of the state during 1992-93, girls numbered 0.84 lakh [Government of Kerala 1993:115]. It is also worth mentioning that high rates of female enrolment at the college level is not confined to arts and science courses; it extends to professional courses such as medicine and engineering as well. For example, out of a

total enrolment of 10,145 students in the engineering colleges (government and private) in the state during 1993, 2,161 (21.3 per cent) were girls [Government of Kerala 1993:291]. (3) Because of the wide acceptance of the small family norm in Kerala, increasingly more and more educated women seek employment after they have had the desired number of children – not more than one or two in several cases. Since child-rearing has ceased to be a prolonged process, women in Kerala generally welcome gainful employment not only to escape the boredom of routine domestic chores, but also to supplement the meagre incomes of their spouses. These observations are in substantial agreement with the findings of a recent study on demographic transition in Kerala in the 1980s [Zachariah et al 1994]. According to the findings of this study, Kerala women now want a very small family – one or two children. Nearly 40 per cent did not want more than two children. For all practical purposes, a woman's reproductive span has been reduced to the

15 years between 20 and 35 years" [Zachariah et al 1994: xviii-xix, see also Bhat and Rajan 1990:1978, Jose 1990:66, Squire 1981:184-85]. Thus as more women enter the labour force, the extent of female unemployment is bound to become more acute, particularly because, as we have tried to explain earlier, women unlike men have stronger preferences regarding place of employment [also see Islam 1987:4].

III

Self-Employed: Their Perspectives

The results of our sample survey have clearly shown that the vast majority of the unemployed rural as well as urban look for salaried/wage employment preferably in the public sector including government service. The desire for salaried employment is particularly strong among the educated unemployed who form the majority in our sample. One of the chief attractions of salaried/wage employment is its relative security which, among other things, implies

TABLE 10. SECTOR OF EMPLOYMENT PREFERRED

Sector of Employment Preferred	Number of Job Seekers Indicating Preferences

All	83 (100.0)	145 (100.0)	228 (100.0)	43 (100.0)	62 (100.0)	105 (100.0)	126 (100.0)	207 (100.0)	333 (100.0)

Note: Figures in parentheses refer to percentages.

a regular and assured income. It is not surprising, therefore, that none of the respondents among the unemployed in our sample expressed any preference for self-employment over regular employment.

Now turning to those persons in our sample who are already employed we find that out of 912 persons belonging to rural households and 505 to urban households there were 234 self-employed among the rural households and 129 among the urban households. It thus follows that given the option the unemployed in Kerala by and large prefer regular salaried/wage employment and that if eventually they settle for self-employment it is as a last resort. In fact this preference is a characteristic of developing countries [Blaug 1973:55]. Many commentators who have examined the scope of promoting self-employment ventures in the state have serious reservations about their success because self-employment is considered, as we have just mentioned, the last resort by most work seekers who are only too happy to give up their current self-employment when they obtain a government job [Gopakumar 1994:4; Nair 1994:6].

EDUCATIONAL PROFILE OF SELF-EMPLOYED

We shall begin our discussion on the self-employed in our sample by describing their educational profile in order to examine whether there is any relationship between levels of education and self-employment. It is interesting to note that in terms of levels of general education, the vast majority (77.2 per cent) of the self-employed in our sample belong to the SSLC/predegree level or below. Naturally, the rural self-employed has a slightly larger proportion (78.7) in this educational category. This result reinforces the prevalent impression that persons with relatively higher levels of general education (graduation and above) do not generally opt for self-employment. As far as self-employed professionals such as engineers, doctors and advocates are concerned, their proportion in our sample is relatively low, being only 9.1 per cent of the total sample. However, comparing the rural and urban self-employed, the urban sample shows a relatively larger proportion (11.6 per cent) of self-employed compared to the rural sample (7.9 per cent). This finding lends support to the commonly held view that there is greater scope for self-employment of professionals in the urban sector. Further, with reference to advocates who constitute the single largest group of professionals in our sample, we may point out that self-employment seems to be the most feasible, though not necessarily the most lucrative, alternative to salaried employment, as the judicial service and the law department of the state government can normally absorb

only a tiny proportion of the practising lawyers and the graduates of the law colleges each year.

As for gender differences, the proportion of self-employed in the sample having educational level of SSLC/predegree and below is higher among the female self-employed by just one percentage point compared to the male self-employed (77.9 per cent and 76.9 per cent, respectively). However, gender differences are higher between and within the rural and urban households. While among the rural self-employed 77.7 per cent of the male self-employed and 82.0 per cent of the female self-employed belong to the category SSLC/predegree and below, for the urban self-employed the corresponding proportions are 75.3 per cent and 72.2 per cent, respectively. The proportion of the less educated among the self-employed it appears shows a certain asymmetry as between the rural and urban households. While on the one hand a significantly higher proportion of the rural self-employed females belongs to the less educated group (SSLC/predegree and below), the relative positions are reversed in the case of the urban self-employed. A probable explanation for this asymmetry lies in the fact that fewer urban female work seekers with less education take up self-employment compared to their male counterparts. As for gender differences in the proportion of professionals among the self-employed both rural and urban self-employed

accounted for a somewhat higher proportion of male compared to female professionals. While 7.8 per cent of the self-employed rural males consisted of professional degree holders, the corresponding proportion was only 5.7 per cent for rural females. Similarly, against 11.8 per cent of the self-employed urban males, only 9.1 per cent of the urban females had professional degrees.

FORMS AND TYPES OF SELF-EMPLOYMENT

The sample survey has revealed a wide variety of self-employment. An interesting finding that emerges from this study is that in regard to the nature of self-employment there is practically no difference between the rural and urban self-employed in Kerala. Perhaps one type of self-employment, farming, is more common in the rural areas but one comes across such self-employment in the towns also. Absence of a clear cut differentiation in self-employment between the rural and urban sectors is a peculiarity of Kerala where the rural-urban divide is very thin. Further it is noted that the most common form of self-employment consists of services as opposed to productive enterprises. For instance, among both rural and urban households, retail (petty) trade is the dominant form of self-employment. This is probably due to the fact that retail trade compared to other tertiary activities is less skill-intensive. It also involves less investment. In fact, old services, such as

TABLE 12. EDUCATIONAL PROFILE OF SELF-EMPLOYED

Note: Figures in parentheses refer to percentages.

petty trading and domestic services are considered relatively more important in developing countries compared to new services (such as education, health, tourism and leisure time activities) for which the income elasticity of demand is positive [Squire 1981:136-37]. Viewing the entire sample of the self-employed as one category, we observe that the most common form of self-employment consists of retail (petty) trade, farming, transport, small enterprises and catering services in that order. Almost all of these are conventional forms of self-employment. It is, however, important to note that retail (petty) trade stands out as the single dominant form of self-employment.

In regard to rural/urban differences relating to self-employment, they are only marginal. It is interesting to observe that even for the rural self-employed, retail trade is far more important than farming. Evidently, the ownership pattern of land prevailing in Kerala is responsible for this state of affairs. While farming is more important as a form of self-employment to the rural households, catering services provide self-employment to more persons among the urban households. Among the relatively minor forms of self-employment, it may be pointed out that the practice of law is widespread among the urban self-employed, whereas running parallel and tutorial colleges and coaching centres is more prevalent among the rural self-employed.

Turning to gender differences in self-employment, there are certain marked variations in preferences. In a sample of 363 self-employed, tailoring is the most important form of self-employment for females (14.3 per cent) followed by (1) retail trade, (2) dairying, milk vending and poultry farming, and (3) fish vending (all three 10.4 per cent each). A major factor which accounts for the relatively high proportion of female self-employed in these pursuits (especially tailoring, dairying and poultry farming) is that they are mostly located within the homestead (or in the neighbourhood) so that women can work there without having to disrupt their household chores [Islam 1987:4]. For the male self-employed, on the other hand, retail trade (21.7 per cent) is the predominant form of self-employment followed by (1) farming (12.6 per cent), (2) transport (11.9 per cent) and (3) small enterprises (9.1 per cent). Interestingly, though not unexpectedly, we observe that certain forms of self-employment are being consistently avoided by the female self-employed. These include transport, workshop, contract business and repairs (of watches, domestic appliances and electronic equipment like TV).

Combining differences in residence status and sex, it is seen that retail trade, farming, transport and small enterprises together

account for a little over one-half (55.5 per cent) of the rural self-employed males. On the other hand, dairying, milk vending and

TABLE 13. FORMS AND TYPES OF SELF-EMPLOYMENT

All	193 (100.0)	41 (100.0)	234 (100.0)	93 (100.0)	36 (100.0)	129 (100.0)	286 (100.0)	77 (100.0)	363 (100.0)

Notes: 1. Figures in parentheses refer to percentages.

2. Retail (petty) trade consists of stationery, panshop, fancy shop, provision store, fair price and ration shops, electrical and auto spare parts, textile and ready-made garments, medical shops etc.

3. Small enterprises consist of flour mill, saw mill, pappad making, xeroxing, bookbinding, cycle shop, typewriting institute, cooking gas agency, petrol pump, bookstall, ivory works, sericulture, computer centre, furniture, copra bakery, cold storage, photo studio etc.

poultry farming fish vending, private tuition and nursery schools, tailoring and retail trade constitute the more important forms of self employment for rural self employed females together accounting for 58.6 per cent. While for urban self employed males retail trade transport small enterprises and catering are the major outlets together forming 54.8 per cent of the self employed in this category the majority of urban self employed females (61 per cent) are engaged in tailoring retail trade catering vegetable and fruit vending and practice of law. It seems that the practice of law is rapidly emerging as a challenging type of self employment among urban females with law degrees. Another emerging outlet for not so highly educated urban females is to work as beauticians.

RATIONALITY OF SELF EMPLOYMENT

Why do work seekers settle for self employment? It is worth recalling here that none of the respondents in our sample of unemployed reported that they were looking for self employment. Barring a few cases of no preference/any jobs and no response the majority of the rural and urban unemployed in the sample expressed a preference for regular salaried employment like clerical and teaching jobs. Moreover even those who did not report any preference for particular job did express their preferences regarding parameters of salaried employment such as minimum salary sector and place of employment. It is thus beyond doubt that self employment is not a generally preferred form of employment in Kerala. Logically therefore it follows that most of those in our sample who have ended up in self employment have done so only after they had failed to obtain regular salaried/wage employment. This presumption is corroborated by the results of our sample survey. Of course as is to be expected there are a few who have taken to self employment for its challenge and a few others who have been motivated by the possibilities of higher returns.

The reasons reported for opting for self employment are indeed very revealing. Out of a total of 363 self-employed in our sample as many as 80 self-employed (22 per cent) have reported that it was their failure to obtain either a regular government job or any regular job that made them settle for self employment. For the rural self-employed this proportion was higher (23.1 per cent) compared to the urban (20.2 per cent). Furthermore 98 persons among the self-employed (forming 27 per cent) have preferred self employment in the expectation of a regular income. We are thus led to infer that a significantly large segment of the work seekers in Kerala prefer salaried/wage employment to self employment and that

eventually if they opt for self-employment they do so only as a last resort - only after they have failed to obtain regular salaried jobs. Interestingly even when they finally decide in favour of self employment it is the lure of a supposedly regular income that makes them do so [Blaug 1973:63]. In other words they tend to view self employment as a substitute for and not as an alternative to regular salaried/wage employment. This tendency to prefer self employment on grounds of expectation of a regular income is much more pronounced among the urban (32.6 per cent) compared to the rural (23.9 per cent) self-employed. In our sample of the self-employed one tenth consists of those who pursue their hereditary occupations or family businesses. They belong either to the rural based artisane industries such as blacksmith

goldsmith dhobi and barber or to the urban based trading and business classes. Obviously their involvement in self employment is more accidental than deliberate. We come across a larger proportion of such persons among the urban (15.2 per cent) than among the rural self-employed (8.1 per cent). A few other self-employed persons totalling 25 in number (7.0 per cent of the sample) have reported that they were engaged in self employment

Note: Figures in parentheses refer to percentage to the total self employed in the relevant category.

for no reason except that they had no other source of income. Among them are included 20 rural self-employed (8.6 per cent) and five urban self-employed (4.9 per cent). A still smaller number of the self-employed forming 2.5 per cent of the sample have reported that their option was based on the fact that there was no one else in the household to attend to the work concerned (e.g. farming). We are thus left with not more than five categories or types of self-employed who have had the right motivation for self-employment.

We note that while most of the respondents in our sample have opted for self-employment either as a last resort or out of sheer helplessness, there is a hard core of self-employed (83 persons in all - 22.9 per cent out of a sample of 363) though very much in a minority, who have taken up self-employment out of the right motivation. It is exactly these factors or impulses that need to be nurtured for the promotion of self-employment.

The proportion of those driven by the right motivation is less by three percentage points in the case of urban compared to the rural self-employed. As for gender differences, there is practically no difference in motivation between self-employed rural males and females. In respect to urban self-employed, however, we observe that a markedly lower proportion of the female self-employed is motivated by higher aims - 11.11 per cent of the urban female self-employed is against 24.7 per cent of the urban male self-employed. Since we have only four observations in this category, any generalisation based on such a small sample could be misleading and hence we shall not attempt any explanation of this difference in motivation.

Rural-urban gender differences apart, we observe that out of 286 self-employed males and 77 self-employed females in our sample, 69 males (24.1 per cent) and 14 females (18.2 per cent) had opted for self-employment in response to higher motivation. The relatively lower proportion of females falling in this category is probably indicative of the additional constraints which female work seekers have to reckon with in choosing the type of self-employment. Self-employment in general requires more initiative and enterprise, more self-reliance and greater urge for independence on the part of the work seekers than salaried employment and female work seekers in predominantly traditional societies/communities are seldom characterised by these traits in ample measure.

EARNINGS OF SELF-EMPLOYED

It is almost impossible to collect accurate data on the earnings of the self-employed. For one thing, most of the self-employed do not maintain any reliable record of their

earnings on a regular basis. For another, even in cases where they do, there is a distinct tendency to underreport earnings for various reasons including fear of being assessed for income tax. Apart from these limitations, there is still another problem, namely, whether the self-employed are able and willing to report their labour earnings net of the value of purchased and owned inputs (i.e. rental value of owned land and business capital). It has been pointed out that such reporting bias is common even in developed countries like the US [Schultz 1988: 595-96]. Notwithstanding these limitations, we present below the results of our sample survey regarding the earnings of the self-employed as they provide a broad picture of the relative magnitudes involved.

The results of the sample survey show that there is not much difference between the earnings of the rural and urban self-employed as reported by them. This is but natural in view of the fact that there is no sharp rural-urban divide in Kerala. However, it is seen that the female self-employed earn consistently less than their male counterparts. This also stands to reason because, as we have pointed out earlier, whether it is salaried employment or self-employment, females are subjected to more constraints compared to males. While one might readily grant that the impact of such constraints is less in Kerala compared to the rest of the country because of the higher levels of female education prevailing in the state, the fact remains that even in Kerala, female earnings are generally somewhat lower, except in those sectors where there exist statutorily fixed uniform scales of pay and allowances for all employees, men and women alike. The survey has also demonstrated that average earnings from self-employment are not on the whole distinctly lower than those from regular employment and that hence the

reasons for the existing preference for salaried/wage employment are to be sought elsewhere. At the same time, the survey results point to the fact that self-employment in Kerala is highly diversified both in terms of type of employment and in terms of average earnings. This is in keeping with the experience of most developing countries where self-employment varies from marginal workers in hawking and vending constituting the poverty category of the self-employed to successful shopkeepers, artisans, hoteliers, brokers, merchants, traders and so forth [Kannappan 1983: 251]. The wide range of earnings enjoyed by the self-employed is brought out in Table 17.

It is seen that over one half of the self-employed in our sample have monthly earnings of Rs 1,500 or above which compare favourably with the average emoluments of salary/wage earners in the organised sector. In fact, about 10 per cent of the rural as well as urban self-employed earn as much as Rs 4,000 or more per month. At the other end of the spectrum, about 5 per cent of them earn incomes below Rs 500. This group may be treated as consisting of the marginal workers or as roughly belonging to the poverty category of the self-employed consisting of vendors and hawkers of all sorts of goods. Besides, another 20.7 per cent of the self-employed derive monthly earnings of Rs 500 and above but below Rs 1,000. This group may be roughly considered to be very close to the poverty category. Thus altogether, roughly one fourth of the self-employed may be said to belong either to the poverty category or to the near-poverty category. Their distribution by levels of income and nature of self-employment are given in Table 18.

Interestingly, the low-income earners among the self-employed irrespective of their particular income bracket are engaged

TABLE 17. DISTRIBUTION OF SELF-EMPLOYED BY MONTHLY EARNINGS (RS)

Range of Monthly Income Reported	Number of Self-Employed in Income Group							
	Rural				Urban			
	Male	Female	Persons	Male	Female	Persons	Male	Female
Below 500	4 (1.59)	7 (16.67)	10 (4.35)	3 (1.26)	3 (8.57)	6 (4.72)	6 (2.14)	10 (12.99)

but below 1000	48 (25.53)	8 (19.05)	56 (24.35)	20 (21.74)	5 (14.28)	25 (19.68)	68 (24.28)	13 (16.88)
1000 and above	31 (25.53)	3 (19.05)	34 (24.35)	16 (21.74)	1 (14.28)	17 (19.68)	47 (24.28)	4 (16.88)
but below 1500	16 (16.49)	7 (7.14)	23 (14.78)	17 (17.39)	2 (2.86)	13 (13.38)	16 (16.78)	19 (5.19)
1500 and above	58 (30.85)	8 (19.05)	66 (28.69)	27 (29.35)	7 (20.00)	34 (26.77)	85 (30.36)	15 (19.48)
but below 2000	15 (7.98)	3 (7.14)	18 (7.63)	9 (9.78)	2 (5.71)	11 (8.66)	24 (8.57)	5 (6.49)
2000 and above	4 (2.13)	0	4 (1.74)	2 (2.17)	0	2 (1.57)	6 (2.14)	0 (1.68)
All	188 (100.00)	42 (100.00)	230 (100.00)	92 (100.00)	35 (100.00)	127 (100.00)	280 (100.00)	77 (100.00)

Note: Figures in parentheses refer to percentages.

in almost identical pursuits such as owner cultivation, livestock and poultry farming, private tuition, hawking and vending of fish, meat, vegetables and fruits, tailoring, transport, petty trade and hereditary occupations. Such types of self-employment are aptly referred to as low-level self-employment where the capital involved may be negligible and entrepreneurial risk taking minimal [Kannappan 1983:212]. None of these low-income self-employed are engaged in any small scale industry worth the mention or in the practice of professions such as medicine and law. Besides, this segment of the self-employed is dominated by female workers. Out of a total of 77 reporting self-employed females in our sample as many as 40 workers (51.9 per cent) belong to the poverty or near-poverty category. In contrast, only 50 (17.9 per cent) out of a total of 280 reporting self-employed male workers are included in this category. The dominance of low-income self-employed females is much more pronounced among the urban self-employed, while out of 38 urban self-employed constituting the poverty or near-poverty category as many as 20 consist of female workers (52.63 per cent) among 52 rural self-employed in the low-income category only 20 (38.5 per cent) consist of female workers.

IV Conclusion

The objective of this paper has been two-fold, namely (1) to examine whether there is any empirical basis for the widely held view that work seekers in Kerala, especially the educated unemployed, prefer salaried

employment to self-employment, and (2) granted that not all work seekers succeed in obtaining salaried employment, to examine what motivates people to choose self-employment. Barring those among the unemployed who either expressed no preferences for any particular job or were ready to accept any job, the most preferred types were found to consist of clerical and teaching jobs. It was noted that aspirants for clerical jobs had fewer qualifications than those seeking teaching jobs. The no preference/any job category of unemployed chiefly consisted of undergraduates and third class graduates. If at all they had any vocational qualifications, they were definitely of a lower level. Probably long waiting periods and the consequent frustration made these people give up their job preferences one after another.

Regarding other job preferences, we have noted that 87 per cent of the rural and 97 per cent of the urban employed have stipulated a minimum salary. However, it was found that unemployed females, rural as well as urban, were willing to work for lower salaries. Their relatively lower reservation price may be due partly to wider unemployment among the educated female labour force and partly to the fact that female job seekers, while greatly valuing economic independence, do not generally expect to be the main breadwinners in the family. In regard to job preferences pertaining to the sector of employment, it is seen that roughly one-half of the job seekers, rural and urban, have no preferences whatsoever. Those who have, however, have a distinct bias in favour of public sector employment. In respect to job preference regarding place of

employment, we have noted that roughly equal proportions (over 65 per cent) of the unemployed, rural as well as urban, prefer to be employed within the state. Interestingly, a distinctly higher proportion of the urban unemployed (40 per cent) prefer employment within the district compared to rural work seekers (19 per cent). As for gender differences, 38 per cent of the rural and 47 per cent of the urban female work seekers prefer to be employed within the district, whereas for the male unemployed, rural and urban, the proportion is a low as about 5 per cent. Needless to say, this tendency does not augur well for the female employment situation in Kerala.

Turning to self-employment, the data on the educational profile of the self-employed in our sample have shown that the vast majority of them (in fact over 75 per cent) belong to the SSLC/predegree level or below. This result reinforces the prevalent impression that a person with relatively higher levels of general education do not generally opt for self-employment. On the gender side, while a significantly higher proportion of the rural self-employed females belong to the lower educational category (SSLC/predegree or below) compared to the male self-employed, there is a reversal of the relative positions in the case of the urban self-employed.

Considering the entire sample of self-employed, we note that the most common forms of self-employment, applicable to both rural and urban self-employed, consist of retail (petty) trade, running transport, small enterprises and catering services. There are, however, distinct gender differences, whereas for the male self-employed retail

TABLE 18. EARNINGS OF SELF-EMPLOYED IN POVERTY/NEAR-POVERTY CATEGORY

Level of Monthly Income (Rs.)	Type of Self-Employment	Rural			Urban		
		No of Self Employed M	No of Self Employed F	Persons	Type of Self Employment	No of Self Employed M	No of Self Employed F
Upto 500	Food vending, petty trade, livestock and poultry rearing, private tuition, owner cultivation, contract business, transport, tailoring, hawking and vending of fruits and fish, broker	9	13	22	Food vending, petty trade, hawking and vending of fish and fruits, tailoring, owner cultivation, livestock farming	5	12
501-750	Owner cultivation, petty trade, Nursery school, tailoring, private tuition, transport, hereditary occupations, livestock farming, vegetable vending, food vending	11	6	17	Owner cultivation, food vending, tailoring, petty trade, vegetable vending	7	1
Above 750 but below 1000	Food-vending, tailoring, transport, livestock farming, fish vending, transport, watch repair, hereditary occupations	12	1	13	Meat vending, tailoring, transport, food vending, poultry farming, fish curing and vending	6	4
	All	32	20	52		18	20

- Notes: 1. Petty trade consists of provision store, stationery, selling pan, cigarettes, soft drinks, etc.
 2. Food vending consists of tea shop, selling snacks, fast food, etc.
 3. Hereditary occupations consists of blacksmith, goldsmith, dhobi, barber, etc.
 4. Transport consists of bus service, autorickshaw and taxi service.

trade (petty trading) is the predominant form of activity followed by farming and transport, for the female self-employed tailoring forms the major type followed by retail trade (dairying, poultry farming and fish vending).

Why do work seekers opt for self-employment? As many as 80 out of the 363 self-employed in our sample (22 per cent) have reported that it was their failure to obtain either a regular government job or any regular job at all that made them resort to self-employment. Another 98 persons (27 per cent) preferred self-employment in the expectation of a regular income. Thus evidently a significant segment of those who are self-employed tend to view self-employment as a substitute for, and not as an alternative to, regular salaried/wage employment. It is, however, relieving to note that while most of the respondents have opted for self-employment either as a last resort or out of sheer helplessness, there is a hard core of self-employed (23 per cent) who have taken up self-employment out of the right motivation (expectation of higher returns, liking for the work, work suitable to own training and so on).

As for the average monthly earnings of the self-employed, while over one half of them earn Rs. 1500 or above, which compares favourably with the average emoluments of salaried/wage employment in the organised sector, there exists a poverty category forming 5 per cent of the self-employed whose monthly earnings are below Rs. 500. Another 21 per cent derive earnings of Rs. 500 and above but below Rs. 1000. These groups may be said to represent low-level self-employment. Significantly, the segment is dominated by female workers.

While the above results are certainly interesting, it is hoped that, in view of the inherent limitations of the data including size and coverage of the sample, this exercise will stimulate further similar studies before definitive conclusions are reached.

Notes

[This paper forms the second in the series of a larger study on employment/unemployment in Kerala I have undertaken under a senior fellowship of the ICSSR and is in continuation of an earlier paper 'Some Socio-Economic Aspects of Educated Unemployment in Kerala' already published in the *IPW*. I am grateful to the ICSSR for the fellowship and to Sabu Philip for valuable research assistance.]

1. The literature on employment problems in developing countries is indeed replete with references to privileges enjoyed by employees in the public sector. For example, referring to a study of university students in Sri Lanka, Blaug points out that 'a great majority of them preferred public sector employment because of superior fringe benefits, greater personal freedom and greater

job security. What makes the public sector so attractive to educated people in many Less Developed Countries is the fact that job performance is not rated and hence that internal promotion is virtually automatic' [Blaug 1973:65].

2. The sample was drawn as follows:

(a) Rural	Andoorkonam	
	households	125
	Karakulam	
	panchayat	125
	Ulloor panchayat	145
	Sreekaniyam	
	panchayat	145
	Subtotal	540
(b) Urban	Attingal	
	households	75
	Nedumangad	
	municipality	75
	Trivandrum	
	corporation	120
	Subtotal	270
	Total	
	(Rural and Urban)	810

The subsamples for Andoorkonam and Karakulam panchayats represented all the 12 wards of the two panchayats; the subsample for Ulloor panchayat was representative of its 10 wards and that for Sreekaniyam was drawn from 13 out of its 14 wards. As for urban households, the subsample was representative of 18 out of 19 wards in Attingal municipality, 15 out of 19 wards in Nedumangad Municipality and 17 out of 25 wards in Trivandrum corporation.

3. A related concept is that of geographical mismatch, i.e. immobility of labour between regions. In most industrial countries geographical mismatch has practically disappeared and hence it is pointed out that there has been a long-term reduction in regional differences in unemployment rates [Godfrey 1986:75].

Mass Movements and Marxist Method

G Vijay

ARUNPATNAIK's critique (*EPW* May 20) of Balagopal's article (*EPW* May 7) calls forth a serious debate on certain theoretical questions. Balagopal's argument not only confronts the dilemma of Sumanta Banerjee's discourse but itself ends up in a different kind of a dilemma, as pointed out by Arun Patnaik.

The study of social dynamics has never been a smooth process since the purpose of revolutionary theory is to capture motion in the process of transformation, unlike a study of qualitatively different points presumed to be static as is done by positivist theories. Arun Patnaik's arguments linking psychic process to its material conditions, his rejection of the dichotomous view of matter and consciousness, his enquiry into the intricacies of moral and material domains to elucidate the theory of liberation, is more an assertion of the classical Marxist understanding than a dialectical negation of Balagopal's arguments. Now, where does Balagopal argue against transformation, he is only questioning the potential of the existing theoretical constructs in materialising its goals. The differences, therefore, in the theoretical conception of the context in Balagopal's and Patnaik's arguments lie not as much in the conception of the existence of motion, as in their conception of its causation.

Marxist method has to its credit the capacity to identify the conditions of a contradiction in the object and to predict the motion of the object based on its dialectical logic. Change in the object has always been handled with relatively greater reliability and confidence by Marxists than by any other theoreticians. However, in relation to itself, though Marxism has an impeccable logic in dealing with the object, Marxist theoreticians desist from entering into a debate on subject transformation. Subject has always been a problematic in Marxist theory since contradictions posed by the subject have always been understood as having an explanation in the object and contradictions in the object as the summation of the contradictions in the subject. However, object is not a summation of the subjects since interaction of the subject is not only with the object but also between the subjects. (In this debate, object refers to the context, subject refers to the individual, and subjective refers to the specificity or particularity.)

Institutions such as family, religion and its rituals came into existence as a result of production. However, the present production processes do not have an immediate necessity

of these institutions since changes in the mode of production have thrown up much more sophisticated mechanisms such as the market to serve this purpose. Even in the west, which has developed capital, these institutions, though weak, do exist. The existence of institutions which no longer have mechanical relations with production make interactions possible on other lines. Thus there is a multiplier impact of the subject interactions on the objective situation and the abstract consciousness of a social movement is more than the consciousness of the subjects involved in it. If one were to believe that object consciousness is a mere summation of subject consciousness, then logically it can be argued that the consciousness of certain subjects may not just match the average consciousness of the object but that the consciousness of certain subjects is more advanced than the consciousness of the object.

It is as a result of his failure to find such an individual that Balagopal takes refuge in Freudian psychoanalysis. Unable to grasp the extreme variation in object consciousness and subject consciousness, Balagopal not only gives up materialist understanding but also dialectical method. It is more a refuge than a solution to the problematic.

However, the problematic persists. The questions which the subject in Marxist theory poses are: when does a subject become conscious? If praxis is a measuring rod, does it mean that all engaged in similar practice have a uniform consciousness? Can individuals with different levels of consciousness engage in similar practice? Such questions are not aimed at refuting the validity of praxis but indicate its inadequacy as a sole determinant of consciousness since in the process of change every new element can only be a complement to praxis and not an alternative to it.

Every individual is part of an overall context which in this debate is Indian society. This overall context is the object which is conditioned by the changes in productive forces, but this objective condition is not uniform since this society is highly segregated and such segregation leads to a situation in which a rise in productive forces has a stratified impact on the consciousness of individuals. It is this varying level of impact of productive forces which we may term the subjective of the objective condition. A mass movement aiming to liberate the masses from any form of oppression acts at one stage as a productive force. When it comes

to the Indian context, it does not have a similar impact on different segments of society. Each segregated movement responds to the other movement with its own subjective notion. Since segregation of the context also increases the scope for segregation of the consciousness, and since stratification exists in the objective condition itself.

Hindu society displays its own specificity in the application of its standards in its construction of theory and practice. Hinduism seems to be extremely accommodative and flexible when it comes to philosophical criticism. It can be observed that all dissent right from Buddha down to Ambedkar has been successfully absorbed into its superstructure without the slightest deviation in its practice. The practice of established undemocratic norms are successfully seen as being independent of the adjustments it makes to its superstructure.

From the point of class, by itself, to the transformation of consciousness to class for itself lies the many segmented contradictions which are not notional. The fundamental question, the tribal question, are outcomes of the segregated unity of the objective condition which subjects them to varying levels of exploitation. The subjective of the objective condition is such that transformation itself conveys different meanings to different people. Every mass movement is interacting with other movements on the plane of diversity which is not allowing contradictions to mature, rendering the productive forces relatively stagnant. Thus neither the objective condition necessitates the motion in subject nor the subject matures to transform the objective since the plane of diversity is more a fetter than a potential transformer.

If we take the Andhra politics in recent times into consideration, we find that these realities are becoming more explicit since the motion of contradictions are more rapid where there are a range of mass movements: a strong dalit movement, a strong women's movement (of which the liquor ban is sufficient evidence) and of course above all class politics. Taking these three perspectives into consideration we can concretise this debate.

We find that these movements have hostile relations though all of them at one level or another are contributing to increasing the level of consciousness and have emerged from the same context. The dalit movement is the outcome of the contradictions that emerged on caste lines which is evident in the atrocities that were committed on dalits in Kurumchedu Chundur, Padirikuppam and such other places. This movement perceives the Nixonite movement as a

movement of the upper castes since they are accused of not taking the caste question seriously in the past. The dalit movement is trying to cash in on the deaths of those who are killed in lake encounters by drawing up statistics trying to prove that most of them are dalits overlooking the fact that those who have died have had no dalit politics. They also maintain that the leadership of the naxalite movement is in the hands of the upper castes. Similar is their approach to the feminist question. In a press conference when Kanchi Ram was asked how he perceived the women question, he replied to the astonishment of all that he had no time to think about women's problems. The naxalite movement in turn has characterised the dalit movement as the movement of the bourgeoisie to subvert class politics, since the dalit movements raised questions only about self respect and capturing of power as ultimate goals leaving land questions unanswered. It is also held that the movement has no specific stand on imperialism nor an economic agenda for the oppressed.

The class based movements also perceive the feminist movements largely as movements of the elite and blame them for not having specific understanding of the problems of women of lower classes, since feminists treat all classes with the same parameter of gender. Feminists on the other hand argue that when atrocities are committed on dalits or when police raid villages in search of naxalites, it is the women who suffer the most. Women are subjected to torture, molestation and rape, all of which have their origin not in caste or class but gender. They blame class and caste politics for having overlooked this issue and feel that these movements are insensitive to their problems since the movements are carried on by people in whom patriarchal values are ingrained. Thus we find that each segregated movement perceives other segregated movements more as competitors than as complements to their motion, more as letter than as catalyst, more as enemy than friend. The subjective of the objective has transformed all transformatory movements segregated as they, into checks on the growth of other segregated movements. Thus there is a stagnation in the overall motion of the context which again appeals to the segregated reasoning in which subjective consciousness of the movement perceives every other segregated movement as the reason for stagnation, rather than as an element in the process of transformation. The exploitation in the objective condition is at such a high degree that when a subject becomes conscious in its subjective of the objective condition, it aggressively searches for immediate solutions for its liberation.

The naxalite movement has the land question as primary on their agenda of struggle. For the dalit movement the caste

question is primary, and for women the gender question is primary on their agenda of struggle. No means exist without ends as Balagopal perceives, nor do ends stagnate as Arun Patnaik perceives. Since transformation in object and subject is not a mechanical process, one must understand that there are forces both in base and in superstructure which contribute to transformation and there are forces that contribute to stagnation, and it is precisely in the analysis of the forces of motion and forces of stagnation that lies the crisis of the existing social economic political cultural and ecological movements.

The feminist movement, dalit movement or class struggle can be accused of being outcomes of self interest if only one aims at the other as primary targets. But this is not what is happening: what is happening is every segregated movement is perceiving every other segregated movement with its own given level of consciousness, as the objective condition does encompass segregation as a matter of fact. All these perceptions appear to be factual and are factual to a certain degree, but the more important fact is that the flaws of the context in its superstructure are played against the motion at the base and the flaws in the base are played against the motion in the superstructure, and as a result the dynamics are so working out that the object in motion is targeting itself instead of the object in stagnation. Since all the exploitations at various levels are true and not mere hallucinations, an exploiter may have a method of diffusing the intensity of exploitation, but transformatory politics cannot have such an option of ignoring certain forms of exploitation. Every liberation from one structure of segregated dominance leaves the struggle incomplete, and it is therefore a necessary task of a revolutionary to absorb and dismantle these segregations by waging wars against all sources of segregations. Perception of the objective through a subjective stand would make the perception more a part of the segregation than a source of liberation. It must also be kept in mind that every segregated stagnant notion would strengthen the forces of stagnation, since history cannot go back. What can happen is that the stagnant forces can eat into the forces that contribute to the motion, of which the disappearance of the liberal democratic section of society is a startling manifestation.

In an objective condition with extreme social stratification and with a highly active superstructure, which far from reflecting the objective reality acts as a veil, to bring to the forefront a true picture of the objective condition is a much more difficult process of extrusion of truth. Balagopal fails to tackle this reality since he adopts a method of dealing with the subjective of the subject,

and it is precisely because of this methodological flaw that in Balagopal's history as Arun Patnaik puts it, struggles exist without determinate goals, goals exist without ultimate aims, aims exist without any dream of achievement.

Balagopal can be accused of idealistic inclinations. His method therefore is inadequate in dealing with the intricacies of the objective situation. However, those Marxists who do not take the questions he raised seriously are being no less idealistic about Marxism itself. It must be noted that the Marxist method is highly creative and the method to a large extent remains unexplored. Balagopal has given up a method without its potential being fully exhausted. For Marxism is an instrument of understanding and not a dogma. In this context Arun Patnaik's method of dealing with the subject in the objective also fails to provide satisfactory answers to these questions. Perhaps one needs to take a much more comprehensive approach in dealing not only with the subject in the objective but also with the subjective of the objective (of the subject).

It is perhaps such an approach which can bring to the forefront those variables in the objective condition which have never been incorporated into the methodology of the study of social dynamics. With this background it can be said that in the process of change on the ground, every movement will have a constructive role to play, as far as it unites the masses against a specific segregated target, but it cannot have transformatory potential unless it acts with an understanding that every segregated movement is a result of the subjective of the object and adopts methods which aim at dismantling not the segregated movement but the segregation itself. In this context class politics have an edge over other politics since it has a much more flexible framework and provides a broad base to absorb these specificities. It is therefore necessary that this discourse deals more with struggles and mass movements, and not as a mere intellectual exercise. It is unfortunate that most of the intellectuals, including some activists like Balagopal whose commitment to the cause cannot be questioned, are engaging in armchair like discourses without directly addressing themselves to the movements nor concretising this abstract debate that goes on in a language non-communicable to activists. The attempt in this comment is to emphasise that an intellectual discourse can at the most bring an existing contradiction into the discourse with greater clarity. Revolution cannot be accomplished through these debates, but only through struggles and mass movements. We can leave it here to the ingenuity of such struggles to incorporate this theoretical debate into their action strategy.

EXPORT-IMPORT BANK OF INDIA

INDIA FAST FORWARD

Editor :
Tarjani Vakil

124 pp

Hardbound

Rs. 1,200/- or
US \$ 40.00 / copy

India Fast Forward, is a Coffee Table Book, targeted at foreign investment into India. It is a compilation of 12 articles, aimed at foreign investors, overseas partners, decision makers and leaders in developed countries having interest in commerce with India. The contributors are eminent persons at policy making level in Government, banking, industry, law, consultancy, journalism with an introduction by the dynamic Minister of State for Commerce, Mr. P. Chidambaram. The articles are authored by :

Dr. Shankar N. Acharya, Chief Economic Adviser, Ministry of Finance, GOI
Dr. C. Rangarajan, Governor, Reserve Bank of India
Mr. O.P. Sodhani, Executive Director, Reserve Bank of India
Mr. Ashok Dayal, Executive Director, Deutsche Bank, Singapore
Dr. R. H. Patil, Managing Director, National Stock Exchange
Mr. Ashok H. Desai, Senior Advocate, Former Solicitor General of India
Mr. Anupam Puri, Managing Director, McKinsey & Company (India)
Mr. N. Vittal, Secretary, Department of Electronics, Government of India
Mr. F. C. Kohli, Deputy Chairman, Tata Consultancy Services
Mr. R. C. Bhargava, Managing Director, Maruti Udyog Ltd.
Mr. Sanjay Lalbhai, Managing Director, Arvind Mills Ltd.
Mr. Mark Tully, Journalist, Former BBC Correspondent for South Asia

*Publishers : Export-Import Bank of India
Centre One, Floor 21, World Trade Centre,
Cuffe Parade, Bombay 400 005*

Exim Bank's Coffee Table Book titled " India Fast Forward " brought out in limited edition on quality paper with illustrations in colour, which makes it an exquisite presentation item for Indian corporates with global interest. The book priced at Rs. 1,200/- per copy in India or US \$ 40.00 per copy overseas is available at the address given below:

Mr. A. V. Somaiya
Deputy General Manager
Export-Import Bank of India
Centre One, Floor 21, World Trade Centre
Cuffe Parade, Bombay - 400 005

**IDBI ASSURANCE.
ANYWAY YOU
LOOK AT IT!**

**Every month.
Every quarter.
All at the beginning.
All at maturity.**

YOUR FOUR-WAY OPTION WITH IDBI'S FIXED DEPOSIT SCHEME*

TYPE	MINIMUM DEPOSIT	YIELD STRUCTURE
Monthly Income Option	Rs 18,000	Rs 195 every month on a 5 year deposit of Rs 18 000
Quarterly Income Option	Rs 10 000	Rs 325 every quarter on a 5 year deposit of Rs 10 000
Lumpsum Discounted Interest	Rs 10 000	You will get Rs 4 572 immediately on a 5 year deposit of Rs 10 000
Cumulative Option	Rs 10 000	A Rs 10,000 deposit becomes Rs 18,958 in 5 years

* Interest upto Rs. 13 000 on the above deposits is tax-exempt under Section 80L of the Income Tax Act 1961

MINIMUM DEPOSIT: Rs. 10,000

Beyond the minimum amount you can deposit in multiples of Rs 1 000. The base interest rate for

a three year deposit is 12.5% And a deposit period of five years and more fetches a base rate of 13%. What's more this deposit comes with the guarantee of India's

premier development bank IDBI. Reflected in the FAAA rating by CRISIL given to this product indicating the highest degree of safety. Naturally an organisation that has total assets of over Rs 36 000 crores can take very good care of your investment. For more details contact your nearest IDBI office or any authorised IDBI agent.

This opportunity is open to * Resident Individuals * Hindu Undivided Families * Partnership Firms * Companies/Bodies Corporate/Societies * Trusts/ Association of Persons.

Literacy: India-China Contrast

Recent census based evidence on literacy shows China to be far ahead of India in basic education. In particular, China is close to the elimination of illiteracy in the younger age groups, while India is nowhere near achieving that goal. Educational disparities follow similar patterns in the two countries, but tend to be sharper in India. China's lead in basic education was established during the pre-reform period, based on a strong commitment to the widespread and equitable provision of schooling facilities at an early stage of development. This contrast in educational achievements in India and China is crucial in assessing their respective development experiences and reform programmes. **2868**

Women and Mental Illness

Community surveys provide information on the socio-demographic profile of the mentally ill in Indian communities. However, these studies do not treat the aspect of gender nor are there other independent studies on women and mental illness. An attempt to fill a conspicuous gap in women's health studies. **2879**

'Private Banking' and the Rupee

Considering the scale on which portfolio funds and 'other capital' have entered India in the last two years, the recent volatility in the exchange rate of the rupee clearly needs to be looked at in the context of international capital flows. **2849**

Institutional Decay

The issues raised by the Supreme Court's recent order holding a principal secretary to the government of Karnataka guilty of contempt are a reflection of the general decline and decay of institutions in the country. **2857**

Fragility Exposed

The fragility of the external payments position, exposed by the market-driven devaluation of the rupee and the depletion of foreign exchange reserves, has shown that the priority assigned to external liberalisation in the government's economic policies is wholly misconceived and is fraught with dangerous consequences. **2847**

Statistical Follies

Subjecting as many indicators of development as possible to multi-variate statistical analysis, researchers define, measure and analyse development to validate economic theories or pronounce policy prescriptions of great import even though, disturbingly often, the statistical techniques they employ are incapable of supporting the type of conclusions they rush to reach. **2887**

Scarce Liquidity

Recent money market movements, highlighted by the spectacular rise in the call money rates, have been led by developments in the foreign exchange market which have aggravated the liquidity strain in evidence since the beginning of the financial year. **2839**

Reform from Within

In the face of the enormous difficulties implicit in the enactment of a uniform civil code, both the initiative for reform of personal laws as well as the creation of institutional structures for building consensus over such reform have to come from within the different communities. **2851**

Russian Elections

Elections will be held in Russia on December 17 to elect a new parliament, the State Duma. While the election campaign has been in full swing for several months and those contesting the elections are in a state of rising high fever, the people remain cool, even indifferent by and large. They do not feel the elections will change anything. **2853**

Distorted Reforms

THE 1995 amendment to Karnataka Land Reform Act (1961) has allowed (1) leasing out land in UK and DK districts up to 40 standard acres for the purpose of aquaculture up to 20 years (Amendment of Section 5, sub-section 2); (2) outright purchase of land by any individual whose annual income from non-agricultural sources is below Rs 2 lakh (Amendment of Section 79A), and (3) exemption of the Rs 2 lakh limit (a) for the purpose of industrial development for which up to 20 standard acres can be bought; (b) for the purpose of educational institutions for which up to four standard acres can be bought; (c) for places of worship for which up to one standard acre can be devoted; (d) for the purpose of horticulture, floriculture, agro-based industry for which up to 20 standard acres can be bought; and (e) for the purpose of housing projects for which up to 10 standard acres can be bought (Amendment of Section 109).

Since 75 per cent of our lands are dry lands, for all practical purposes, one standard acre is equal to 5.4 acres of dry land. The imminent danger from the above amendments is, land being supply inelastic, small and marginal farmers in the proximity of urban and semi-urban areas will be lured by the wealthy to sell off their lands. In this process they may be assured windfall gains by a one-time fancy price. However, as the land market is seldom perfect, the real estate agents acting as middlemen will swallow heavy margins. More seriously, there are several instances where farmers have sold their lands in the urban fringe, and have fallen prey to the capital mismanagement trap. This is largely true for our small and marginal farmers who have absolutely no education regarding matters of land markets and investments. Hence, they fall prey to the short-term windfall gain instead of reaping a sustainable regular income from their land every year, all through their life. In addition, what can these farmers do after land sale? They have virtually no skill other than agriculture. One need not go very far to see this scenario. A reconnaissance survey of villages closer to Bangalore city clearly reflects that a majority of these erstwhile farmers who sold their lands for different purposes, have not been better off in the long run. Many of them have become labourers on the land which they owned earlier, since the new investor is most often an absentee landlord and not a farmer. These policies also encourage private investment on land (as there is no de facto

income tax on agriculture) and conversion of black to white money.

Some argue: why should our farmers stay in the villages, let them come out, by selling their land and investing their capital in urban areas. Will our new landlords ever settle in villages to develop their lands? What types of tensions prevail between the class of absentee landlords on the one hand and the class of erstwhile landed farmers who are now landless? What is the threat to our food security? What will be the threat to equity in asset and income distribution? These are the questions to be considered before even amending the land reform act. We should remember that no 'remote-control' technique can work in agriculture. An agriculturist has to live on the farm for day-to-day operations. Since the governor has already consented to these amendments, these questions become even more serious now.

M G NAGARAJA

Bangalore

ICSSR

INDIAN COUNCIL OF SOCIAL SCIENCE RESEARCH (ICSSR) has been established by the government of India primarily with the objective of financing research projects. In the initial years a large number of research projects submitted by scholars used to be financed but of late the number has been drastically reduced. Hardly a dozen projects involving an outlay of less than Rs 2 lakh in all are financed in

a year while the annual grant of ICSSR is rising by about Rs one crore and currently it gets a grant of Rs 10 crore from the government of India. Why has the financing of projects fallen so drastically when the grants have increased? Have the establishment expenses so phenomenally increased as to leave almost nothing to finance projects for which it was primarily established?

ICSSR publishes a quarterly *Newsletter* but it does not mention how many proposals were received and how many were rejected and how much time was taken in clearing them. ICSSR finances various social science research institutes whose activities are reported in the *Newsletter* but the income and expenditure account either of ICSSR or the institutions funded by it is never published. Now when there is so much talk of transparency it will be a welcome move if ICSSR publishes its accounts as well as those of other institutions funded by it. This will be a precedent and other autonomous bodies like the Indian Council of Scientific and Industrial Research and the Indian Council of Agricultural Research whose annual grants are in the range of Rs 500 crore will be morally bound to publish their accounts.

The governing council of ICSSR consists of highly respected and eminent social scientists and they should take the lead in it. In a democracy the public should have a right to know as to how fruitfully or otherwise the taxpayers' money is being utilised.

Disinvestment Fiasco

THE fiasco of the ninth round, the first of this fiscal year, of disinvestment of shares of public sector undertakings (PSUs) is another case, after the exchange rate and money market turmoils, of the adverse consequences of the government's narrowly focused macro-economic adjustment policy. As a revenue raising exercise to help reduce the fiscal deficit, the government first decided upon disinvestment of its holdings in select PSUs in 1991. Though the original decision was to allow PSUs also to dilute the government holding by fresh issue of shares, subject to such holding not being reduced below 51 per cent, the emphasis has throughout been on disinvestment of the government's existing shareholding to raise budgetary resources, as recommended by the Rangarajan Committee. In the first four years of disinvestment from 1991-92 to 1994-95 the centre's budgets have shown actual receipts of Rs 10,188 crore on this count. To fulfil the target of Rs 7,000 crore for the current year, the government decided on three rounds of bids, but market conditions did not allow it to issue the first bid till October. It did try to test the market with a proposed public issue of equity by MTNL of Rs 570 crore at a premium of Rs 180 per share, but the issue had to be postponed due to fear of a poor market response. Apart from the decline in share prices and persistent shortage of liquidity in the capital market, the response to the government's own market borrowing and to bond issues by many PSUs has been poor. But with the government in dire fiscal straits and with time running out in the fiscal year, the disinvestment process could not be held up indefinitely.

The government was therefore pushed into hurriedly introducing a series of measures to boost the capital market and thus perk up the environment for disinvestment of PSU shares. Reintroduction of forward trading by SEBI, the presidential ordinance on depositories, the shifting of the IDBI scrip from the cash to the specified group and the issue of new guidelines for foreign venture capital funds have all been aimed at this objective. Despite all these efforts, the attempted disinvestment of shares of four PSUs, including the three (SAIL, ONGC and MTNL) with the highest asset-holdings among public corporations, has flopped. Against the expected amount of Rs 1,995 crore (based on the reserve prices) from the offer of 2,714 lakh shares of the four PSUs, the government has been able to sell just 153 lakh shares worth Rs 168.62 crore. Though details are not known, apparently bids for about 900 lakh shares – one-third of the total on offer – were received, but only one-sixth of them could be accepted, on the basis of the reserve prices recommended by the three chosen merchant bankers, IDBI,

ICICI and SBI Caps, who refrained from participating in the bids. There has been apparently a concerted attempt by market players to keep the bids well below the market prices with the intention to force the government finally to sell the shares at heavy discounts. FIIs did not bother to bid at all. The public outcry over the manner of the initial disinvestments of 1991-92 (Rs 3,038 crore) and 1992-93 (Rs 2,866 crore) and the proximity of the Lok Sabha elections have stood in the way of the government bowing to the dictates of the market players so far. Even so, some major compromises have been made. First, the three merchant bankers chosen to recommend the reserve prices apparently pegged them below the levels of the previous round. In some cases the reserve prices were lower than even the prices which the government had refused to accept in the previous round. For instance, in March this year the government had rejected the bids for MTNL shares of Rs 200 against the then reserve price of Rs 217, whereas the reserve price recommended for the latest round was Rs 152. Likewise, there was a significant demand for SAIL's shares at Rs 45 in the previous round against the reserve price of Rs 50, the government had rejected the offers. In the latest round, however, the reserve price recommended by the merchant bankers was just Rs 30. A second compromise related to the method of fixing the reserve price. Though the details are not known, the merchant bankers were expected to take into account the intrinsic value of the PSU shares as represented by the net asset values (NAVs), profit earning capacity values (PECVs) and the discounted cash flows (DCFVs), which would have given much higher prices for the PSU shares. Instead, it appears that the merchant bankers have been content to recommend reserve prices close to the prevailing market prices for the three quoted scrips: Rs 30 against Rs 31 for SAIL, Rs 152 against Rs 156 for MTNL and Rs 252 against Rs 242 for ONGC. A third compromise was that the government adopted the reserve prices recommended by the merchant bankers instead of, as on earlier occasions, adjusting them for the highest average realisation on each share in the previous auctions. It was announced in advance this time that the government would go solely by the reserve prices recommended by the merchant bankers, though the reserve prices themselves were not revealed. Finally, it has been pointed out that in the case of large asset-based and prospectively sound public corporations a fixed price public offer has the advantage of protecting the intrinsic worth of the shares which the auction system cannot achieve, especially an auction system based on prices influenced at best by considerations of short-term demand and supply and, at worst, by speculative forces. In the circumstances, the auction

system generally fails to capture the intrinsic worth of the PSUs. Even the so called piggyback approach involving government disinvestment when the PSUs approach the market with fresh public issues may fetch better prices.

However, with the government's mind set on privatisation as an end in itself, the PSUs which even today account for 45 per cent of domestic investment have been facing the worst of all the worlds as it were. Their budgetary allocations have been drastically curtailed. In 1990-91, of the total plan outlay of Rs 28,054 crore in respect of central public enterprises, Rs 7,595 crore (or 27 per cent) were provided as budgetary support to these enterprises in the form of equity and loan. In 1995-96, budgetary support to PSUs is down to 12 per cent (Rs 7,013 crore out of budgeted plan outlay of Rs 56,868 crore). Second, the 35 prized PSUs which put India on the industrial map of the world (SAIL, ONGC, IOC and the other oil companies, BHEL and the other engineering corporations and NTPC) are on the whole precluded from approaching the market on their own because they are overshadowed by the government's disinvestment programme. All the while, any genuine reform of the PSUs has been put on hold. Many PSU chiefs have been demanding operational autonomy and decision making authority for their boards; their pleas have fallen on deaf ears. While all limits on managerial remuneration have been lifted in the case of private and foreign firms, the maximum remuneration that chairpersons and managing directors of even gigantic PSUs such as SAIL, ONGC, BHEL and NTPC is tethered to the salaries of bureaucrats. Further, in a travesty of all the talk of level playing fields, PSUs in the telecom sector, such as ITI, have been specifically debarred from participating in the value added telecom services which have been opened up for private companies and foreign investors. PSUs in the oil sector have been forced to collaborate with the very multinationals, the nationalisation of whose Indian operations had led to the creation of the PSUs, in the power sector special concessions have been given to attract private and foreign investment, but the growth of BHEL, NTPC, NHPC and the like has been hindered by denial of orders, absence of transparency in contracts and lack of concern for the mounting dues from the state electricity boards, and while import duties on chemicals and fertilisers have been slashed, administered input prices have rendered PSU products costlier than imported goods.

A fresh look by the government at its policy of PSU disinvestment is clearly imperative. First, annual targets of finances

to be raised through disinvestment need to be dispensed with. In other words, disinvestment should not be linked to budgetary needs. The major PSUs are valuable public assets, provided they are allowed to attain their full potential. Apart from organisational strengthening, functional autonomy and freedom from bureaucratic controls, resources raised from the market either through disinvestment or through issue of fresh capital should be allowed to be used by the PSUs themselves, as has been demanded by the planning and industry ministers. If the capital structure of corporations like the ONGC do not permit fresh issue of equity, the disinvested funds should be given as loan capital for the corporations so that they may revitalise and expand their activities. The ONGC has proposed the conversion of Rs 1,000 crore out of Rs 2,000 crore of equity held by the government into loan, but this has been rejected by the government. In principle, it is desirable that public corporations are allowed to raise capital from the market based on their intrinsic worth which may also achieve the goals of wider public participation and greater accountability of PSUs, to the extent these objectives can be secured by scattered private ownership of shares.

KASHMIR

Cosmetic Measures

If Narasimha Rao thought of claiming credit for putting Burkina Faso on the world map by announcing his solution for the Kashmir problem from there, he is in for a big disappointment. Neither the people of Burkina Faso nor the Kashmiris are likely to remember what in the long term may turn out to be a damp squib.

The much publicised promise of Rao's to strengthen the autonomy of Kashmir (within the Constitution), made from Burkina Faso, will hardly make any dent in either the popular anti-India mood or the militant activities in the valley. If the people there are expected to hail as autonomy Rao's cosmetic concession of restoring the nomenclature of the governor and the chief minister of Kashmir to the old 'Sadar-e-Riyasat' and 'Wazir-e-Azam' respectively, it would be the height of absurdity. For, that is all that Rao has promised so far in tangible terms. As for the much talked-about economic package, nothing concrete has been enumerated as yet. If Rao is talking about autonomy, he will have to undo all that had been done by New Delhi to erode that autonomy since 1953. After Sheikh Abdullah's arrest on August 9, 1953, his

successor, a private Bakshi Umar Mohammad, allowed New Delhi to usurp authority through two pieces of legislation. The first, the Jammu and Kashmir (Amendment) Act of 1954 deleted Section 75 of the Jammu and Kashmir Constitution Act 1939 which had made council of ministers of the state the final interpreters of the Constitution. The second was the Constitution (Application to Jammu and Kashmir) Order 1954, issued by the president of India, whereby the jurisdiction of the centre was extended from the original three subjects of 'Defence, Foreign Affairs and Communication' to all subjects on the Union List. Since then, a series of central measures have steadily encroached upon the autonomy that the state had enjoyed; usurped one by one all the rights that were guaranteed to the Kashmiris by the Indian government following the accession of Jammu and Kashmir to the Indian Union. The National Conference's demand for restoration of autonomy and return to pre-1953 position therefore acquired importance in the present context, exploration of avenues for solving the Kashmir imbroglio. But if after weeks of negotiations with Narasimha Rao, the only concession that the National Conference leader, Farooq Abdullah, has gained is to be allowed to be known as 'Wazir-e-Azam', he becomes chief minister of Kashmir, will be quite a problem for him to persuade his party cadres to participate in the election which the government wants to hold in December. With the credibility of his party lost in the valley, what little chances of revival that were being explored by him demanding a return to the pre-1953 position have now totally collapsed.

As for the Congress, more discredited in the valley than the National Conference, hopes to gain from the election by relying on the possibility of its boycott by other parties and thus emerging as the ruling party in the entire state of Jammu and Kashmir with support from its followers in Jammu and Ladakh. This is the game plan that has prompted Rao to announce elections in Kashmir.

Rao is also banking on the divisions within the militants and their main front, the Hurriyat, as well as the increasing frustrations among the common people in the valley with the Hurriyat leaders. In spite of the divisions, the militants, and particularly the foreign mercenaries among them, have enough fire power to disrupt elections and terrorise the voters. The latter also are not inclined to vote *en masse*, given their hostile mood towards the Indian government. From all indications, therefore, Rao is hoping to instal a Congress government in Jammu and Kashmir via

to power primarily by the electorate in Jammu and Ladakh, with a poor turn out in the valley. Even with an elected government in Srinagar, there will be no signs of an end to the plight of the Kashmiris who are tired of the violence indulged in by the security forces and the militants and are sceptical about the elections.

POLITICS

Janata Dal under Pressure

AFTER the fall of the Bahujan Samaj Party (BSP) government in Uttar Pradesh, Mulayam Singh Yadav has become the focus of non-Congress, non-BJP political alliances in the state. Sharad Yadav, a strong votary for Janata Dal (JD)-BSP alliance while keeping Mulayam Singh at a distance, overestimates the strength of the JD in UP. Though the JD may have secured 12.5 per cent of the votes in the state assembly elections of December 1993, it should not be forgotten that since then Ajit Singh has left the JD to join the Congress, while a sizeable number of JD MLAs have crossed over to Mulayam Singh's Samajwadi Party (SP). Thus the clout of the Janata Dal has been significantly reduced, with Muslims in the state now firmly aligned behind Mulayam Singh. It is in this context that the Badarpur rally of November 5 under the banner of 'Secular and Social Unity Front' and attended by Mulayam Singh, Ram Vilas Paswan and Mufti Mohammad Sayeed assumes significance.

Laloo Prasad Yadav and Sharad Yadav have criticised Paswan for his haste in going ahead with the rally with Mulayam Singh. Laloo Prasad fears that Paswan's tying up with Mulayam Singh may send the wrong signals and dalit JD MLAs in Bihar, who are mostly Paswan's followers, might think of mending fences with the SP in his state. Moreover, Laloo Prasad and Sharad Yadav are yet unsure whether Mulayam Singh has given up his ambitions of emerging as the leader of the yadavs in the Hindi belt. Mulayam Singh had campaigned against Laloo Prasad in the last assembly elections in Bihar. On the other hand, the rift between Mulayam Singh and Kanshi Ram, and the successive splits suffered by the BSP, are a golden opportunity for Paswan to carve a niche for himself among the dalits of UP. Though it is open to question how far Paswan's Dalit Sena will be able to mobilise dalit votes, given that Kanshi Ram still controls the majority of them, for Mulayam Singh any access to dalit votes through Paswan is welcome as it enhances his position as the leader of the state. With the Congress having appointed B P Maurya, a

senior ex-leader of the Republican Party, as a general secretary and the BJP having recently held a dalit rally in Kanpur, it is clear that the 22 per cent dalit votes hold the key as to who will rule the state and, to a certain extent, the nation.

Mulayam Singh stands to gain this time from the consolidated Muslim votes in western UP which in the December 1993 assembly elections had been divided between the JD and Mulayam Singh's SP. Further, the two breakaway factions of the BSP - BSP (Raj Bahadur) and the Apna Dal formed by Sonelal Patel, Ram Lakhan Varma and other kurmi leaders - have indicated a preference for Mulayam Singh in the forthcoming parliamentary and state legislative elections. The Left Front has declared its support for Mulayam Singh and has advised the JD to patch up with him. Thus various sections in UP are veering towards Mulayam Singh as a credible counter to the BJP.

A JD-SP alliance in UP means mostly leaving out the BSP, given the recent acrimonious relations between SP and BSP and between Paswan and Kanshi Ram. But this is a predicament which the NF-LF is facing in a couple of other states also. It has to choose between DMK and AIDMK in Tamil Nadu and NTR and Chandrababu Naidu in Andhra Pradesh. Though the choices are hard, it is essential that NF-LF make up their minds early. Otherwise, the NF-LF will become a platform for all and sundry which is bound to create problems when it comes to seat allocations.

NUCLEAR THREAT

Not from Arms Alone

MORE than half a century after the nuclear arms race began, the International Court of Justice has been asked to decide whether the producing and storing of nuclear arms should not be considered illegal on the grounds that they are a health and environmental hazard. The issue has been raised by the World Health Organisation. While the decisions of the court are not binding on nations, this is bound to be a historic case, even though in a sense the issue is of academic interest only now. For one thing, it is ironic that the WHO should have decided to raise the issue now when there is a greater momentum all round towards disarmament than ever in the past and when the geopolitical situation has eased the compulsions of earlier decades. It is also noteworthy that the WHO should focus not on the entire nuclear industry, but only on nuclear arms.

With the nuclear non-proliferation treaty becoming permanent, there is bound to be

greater pressure on nuclear nations to cap their arms programmes. The major area of contention today is not the existing stocks of arms but related issues which have greater or as much significance for the health of nations and the global environment. These are the testing of nuclear weapons and the disposal of stocks of nuclear materials meant for arms. With France persisting with the tests in Mururoa atoll despite increasing evidence on environmental damage and in defiance of worldwide protest, the movement towards the signing of the Comprehensive Test Ban Treaty has become even more uncertain. France has not conducted nor allowed anyone else to undertake extensive studies on the damage that these tests have caused or will cause. Its own studies which deny any damage to the delicate geological structures and the associated ecology of the region have come in for criticism on the ground that not all the available information has been made public. There is also a dearth of reliable data on the impact of low levels of radiation and marginal increases in low-level radiation on health. The health and environment hazards posed by the stockpiled nuclear material meant for weapons production is now a worrying issue in the US. The disposal of highly toxic and radioactive materials like plutonium with extremely long half-lives is causing enormous problems. Similarly, the vast acres of decommissioned nuclear plants for the manufacture of weapons need to be protected and kept from public access for generations, if they are not to accidentally harm health and environment.

The other related issue untouched by the WHO petition is the proliferating peaceful nuclear industry. The health and environment issues in the industry have been under debate for some time now and in many countries there is a strong movement seeking a ban on the industry. In Sweden, for example, the Social Democratic government is now considering ways and means of implementing the decision taken 15 years ago to decommission nuclear power plants. In the US too, many plants on the order-book have been scrapped. In a sense, the hazards posed by nuclear plants which have public access and are part of public utilities is far greater than the potential threat posed by the stockpiling of nuclear arms. The point is that the hazards posed by both uses of nuclear energy were evident long before Hiroshima and Nagasaki. There is as little chance of developing a 'safe' nuclear industry for peaceful purposes as there is of 'safely' manufacturing and storing nuclear weapons. One can only hope that the WHO's interventions in the course of the proceedings of the court will draw the two streams together.

CURRENT STATISTICS

EPW Research Foundation

The index of industrial production for the first quarter of 1995-96 shows a growth of 13.3 per cent against 7.2 per cent in the corresponding period of 1994-95. The 14.3 per cent growth in mining and 12.5 per cent growth in electricity are unprecedented. In manufacturing, growth has been widely spread. Capital goods industries growing by 20.6 per cent continue to lead the acceleration as in 1994-95, recovering the lost ground of the previous three years. In consumer goods which rose by 15.5 per cent, the rise of 14.2 per cent in consumer non-durables, close to the 20.1 per cent growth in consumer durables, is again unprecedented and is largely the result of a rise of 45.4 per cent in food products against a fall of 3.5 per cent last year. A rise of 23.2 per cent on top of the 19.3 per cent in 1994-95 in crude petroleum stands out amongst the core industries, which have all experienced accelerated growth.

HINDALCO

Expansion Plans

HINDALCO, an Aditya Birla group company and the country's largest integrated producer of aluminium, is one of the most efficient producers of aluminium in the world. There are two reasons for this. First, power which constitutes around 30 to 40 per cent of the total cost, is generated captively by the company's thermal power plant at Renusagar. Second, added to the fact that India has abundant reserves of bauxite, the basic raw material required, the company has its own bauxite mines.

Firm global aluminium prices combined with reduced operational costs worked in favour of Hindalco, giving a big boost to its results. The company closed the financial year ended March 1995 with a sales turnover of Rs 956 crore, up by 28 per cent from Rs 750 crore in the previous year. Provision for depreciation and tax rose by 23 per cent and 121 per cent respectively, in spite of which the net profit rose by 85 per cent from Rs 158 crore to Rs 292 crore. The boost to net profit was given by other income, which rose from Rs 66 crore to Rs 119 crore, a rise of 80 per cent. A dividend of 55 per cent on an expanded capital of Rs 48 crore has been declared against 45 per cent on a capital of Rs 43 crore in 1993-94.

Metal production during the year was 1,64,280 mt, 5.5 per cent higher than the production of 1,55,761 mt in the previous year. Alumina production stood at 3,19,873 mt against 3,15,723 mt. Output of rolled products in 1994-95 was 38,202 mt against 30,740 mt, an increase of 24.3 per cent. Production of extrusions was 11,416 mt, the highest in the history of the company and 16 per cent higher than the production of 9,807 mt in the previous year. Power generation at the company's Renusagar plant was the highest ever at 2,899 million units, 8.8 per cent higher than the output of 2,665 million units in 1993-94.

The company's sales in 1994-95 were Rs 956 crore against Rs 750 crore in 1993-94. The increase is attributed to improved realisations and a better product mix. The sales outlook is encouraging, given the prospects of high industrial growth, firm market trends and higher output of value added products. Aided by improvement in the international prices of aluminium, the company exported aluminium and semi-fabricated products of the value of Rs 67 crore against Rs 47 crore in the previous

year. Imports moved up by 50 per cent from Rs 27 crore to Rs 40 crore.

Hindalco is currently implementing an expansion programme under which the smelting capacity is being raised from 1,70,000 tpa to 2,10,000 tpa and power generation capacity from 350 mw to 500 mw. The expansion, involving a capital cost of Rs 1,250 crore, is to be completed in the current year. Further expansion to increase aluminium smelting and captive power generation capacities by 32,000 tonnes and 75 mw respectively are on the anvil. To match the planned increase in smelter capacity, alumina capacity will be increased from 3.5 lakh tpa to 4 lakh tpa. The expansion project involves installation of a cogeneration power plant for generating power. The steam extracted from the turbines would be used for the alumina plant process, resulting in higher efficiency. BHEL will supply the main equipment for the project. The expansion is to be completed in two years. The expansion of smelting capacity together with installation of another power generating unit would entail an investment of Rs 500 crore to be funded from internal accruals and loans from financial institutions and banks. Putting the emphasis on production of value added products through forward integration, Hindalco is setting up a 5,000 tpa foil plant in Daman. The choice of the location is in keeping with its strategy of having its plants located near the smelters.

A comprehensive technological up-gradation of the hot and cold rolling mills is also being undertaken with equipment procured from Davy McKee Poole, UK, and Tata Construction and Projects. As a first step towards improving the quality of rolled products and extrusions, the company is installing a state of the art vertical ingot casting machine and billet casting machine sourced from Wagstaff Engineering, USA. It has also purchased a continuous ingot casting machine from Brochot of France to cater to the international market.

The company has decided to enter into a new collaboration with Kaizer International, US, for smelter technology. For alumina and fabrication technologies, Hindalco's choice is Reynolds and Raytheon Engineers and Constructors, USA.

Hindalco has decided to go in for its second integrated aluminium project near a port, either in Orissa or Andhra Pradesh, at an estimated investment of Rs 6,000 crore, with a capacity of at least 1,00,000 tonnes of ingots. The company's diversification plans include a foray into non-aluminium areas such as power, steel and cement. Begin-

ning with power, the company plans to take up steel and cement projects at a later stage. For the green field power facility, Madhya Pradesh is Hindalco's choice.

The company has been awarded ISO 9000 certification during the year under review. The certification by RWTUV of Germany was given for the company's operations in totality.

Aluminium price increases coupled with a reduction in import duties from 50 per cent to 40 per cent have benefited the company. Since the domestic price of aluminium ingots are linked with the international price, Hindalco has benefited from the price rise on the London Metal Exchange. This rise, expected to continue, augurs well for Hindalco. Another boost will be from the automobile industry which is expected to grow at the rate of 20 per cent per annum.

JINDAL STRIPS

Rise in Steel Demand

Jindal Strips, the flag ship company of the Delhi-based O P Jindal group, is one of the largest composite steel producers in the private sector. The company, having started its operations with a single plant at Hissar, has come a long way and today is a multi-plant, multi-location company, and one of the few integrated steel companies in the country manufacturing white metal strips, pipes and billets and slabs.

The company closed the financial year with a sales turnover of Rs 708 crore, up by 30 per cent from Rs 544 crore in the previous year. An increase of 21 per cent in other income saw total income rise to Rs 756 crore. While interest costs came down by 1 per cent, provision for depreciation and tax rose by 53 per cent and 11 per cent, respectively. The company ended up comfortably with a net profit of Rs 73 crore, up by 43 per cent from Rs 51 crore in the previous year.

The company exported goods worth Rs 7 crore, against Rs 10 crore in the previous year. Imports rose from Rs 132 crore to Rs 164 crore, primarily due to a rise in the import of raw materials from Rs 111 crore to Rs 144 crore.

Strengthening its position as the largest stainless steel producer in the private sector along with a shift to more value added products like industrial grade steel which offers higher margins, seems to have been the strategy of the company. During the year under review, the company installed a sponge iron manufacturing unit at Raigarh, with a capacity of 4 lakh tonnes per annum.

The company has plants in Hissar in Haryana with totally integrated stainless steel facilities. Vasind in Maharashtra with facilities to manufacture cold rolled mild steel products and in Raigarh in Madhya Pradesh where its sponge iron plant is located. Production in the Hissar division was 1,00,012 mt and at Raigarh 2,52,591 mt. The Vasind division produced 1,27,585 mt of cold rolled strips during the year.

The industrial growth in 1994-95 provided the much needed impetus to the production of steel which picked up significantly after being sluggish for the last two or three years. Production of saleable steel increased by around 8 per cent in April-November 1994 as compared to the corresponding period in 1993. Similarly production of finished steel also increased by around 10.5 per cent in the same period. It is estimated that the demand for finished steel would be around 23 million tonnes in 1996-97. In view of this, the company has major expansion, diversification and modernisation plans, the objective being not only to increase production but also to improve per unit realisations by producing value added products.

The company's Rs 100 crore expansion at Raigarh will increase its sponge iron capacity to 5 lakh tonnes. The company has a captive iron ore mine which meets the raw material requirements of the plant. An expansion plan of Rs 350 crore at Hissar is on the anvil. The plan envisages the setting up of a new melting shop at a cost of Rs 100 crore and a new rolling mill. Stainless steel output at Hissar is slated to increase from 1 lakh tpa in 1994-95 to 2 lakh tpa in the current financial year. The plan is to further increase capacity to 2.50 lakh tonnes. With this, the market share of the company would increase from 15 per cent to about 34 to 40 per cent.

A hot strip mill with a capacity to roll 5 lakh tpa is expected to be commissioned during the year, orders for which have already been placed. The expansions are to be financed through internal accruals and term loans. The company is also setting up a 45 mw captive power plant that will use waste heat from gases from its sponge iron plant. The engineering capability of the company has made it possible to install plants quickly and at low cost. By buying equipment and making some on its own, the company has benefited from low investment costs. Its cold rolling plant for instance cost just 25.33 per cent of what a new plant would. Though Jindal Strips is investing in new equipment, it will still manage to keep capital costs low as portions which are not critical are built in house. Even with new equipment, the cost of its cold rolling plant is 60 per cent that of a new one.

Higher Profits

Gujarat Narmada Valley Fertilisers Company (GNVFC) manufacturing chemical fertilisers and petrochemicals closed the financial year ended March 1995 with net sales of Rs 671 crore, up by 6 per cent against Rs 633 crore in the previous year. Other income increased by 43 per cent. Total income rose to Rs 670 crore up by 12 per cent from Rs 601 crore. Interest costs were down by 19 per cent. A marginal rise in the provision for depreciation coupled with a zero tax provision like in the previous year saw the company end up with a net profit of Rs 92 crore up by 67 per cent from Rs 55 in the previous year. A dividend of 20 per cent has been declared by the directors compared to 18 per cent declared last year.

Investments of the company for the year under review increased to Rs 147 crore from Rs 16 crore. Under the public sector units disinvestment scheme of the government the company was a successful bidder for 40 000 shares of ONGC and 1 lakh shares of IOI and has paid a sum of Rs 6 crore and Rs 7 crore respectively.

The improved performance of the chemical plants saw the production of ammonia move up by 4.9 per cent to 4.97 lakh tonnes compared to 4.73 lakh tonnes in the last year. Production of urea also increased by 5.2 per cent to 6.87 lakh tonnes from 6.53 lakh tonnes. Production of methanol went up by 14.9 per cent to 1.26 lakh tonnes. The formic acid plant produced 8,241 tonnes of formic acid in 1994-95. However sales of formic acid declined by 15.6 per cent from Rs 25.78 crore in the previous year to Rs 21.76 crore. Sales of urea went up by 21 per cent to Rs 217 crore up from Rs 180 crore in the previous year. Similarly sales of methanol increased by 49.4 per cent to Rs 137 crore from Rs 92 crore. Sales of ammonium nitro phosphate and calcium ammonium nitrate touched Rs 97 crore and Rs 45 crore respectively.

The performance of the electronics division suffered as a result of the stiff competition in the domestic market arising from the easy availability of imported printed circuit boards (PCBs). Considering the unfavourable market conditions, the company produced only 6 139 square metres of PCBs against the installed capacity of 44 000 square metres. The turnover of electronics division during the year was Rs 7 crore. The PCB plant has been accredited with ISO 9002 certification.

The company performed well on the export front and export earnings reached Rs 18.06 crore compared to Rs 8.1 lakh in the previous year. It exported 14,896 tonnes of methanol to South Korea, Singapore, Dubai and the Netherlands.

The acetic acid project which is scheduled to be commissioned by July 1995 is the first of its kind in the country with synthetic methanol carbonylation technology from BP Chemicals UK. The requirement of basic raw material for the said project will be met from the company's methanol plant, resulting in lower cost of production and increased profitability. The capacity of the plant has been set at 1 lakh tonnes per annum. A part of the production has been earmarked for export.

The company is installing a synthetic gas generation unit (SGGU) at its methanol plant at an estimated cost of Rs 30 crore. The commissioning of this gas unit by end 1996 will enable the methanol plant to work independently of the ammonia plant. The unit will generate synthetic gas to produce 30 000 tpa of methanol from the existing methanol plant.

The company plans to enter fertiliser trading and has concluded a memorandum of understanding with a company in west Asia to set up a urea plant. It also proposes to diversify into telecommunications. Also on the anvil is an argon gas recovery unit and expansion of its existing methanol production capacity.

Narmada Chematur Petrochemicals, a subsidiary is implementing the aniline and TDI projects. The company has started marketing aniline which, according to company reports, has been well received. Another subsidiary, Gujarat Narmada Auto, which has been incurring losses, has been referred to BIFR. Its operations are to be wound up as there is no concrete proposal for its revival.

IN NEWSPRINT AND PAPERS

Expansion Project

Tamil Nadu Newsprint and Papers promoted by the government of Tamil Nadu is a pioneer in bagasse based newsprint and owns the country's largest bagasse-based paper plant. It has a present capacity of 300 tpd of newsprint/paper and is the only manufacturer using a process which can be switched to making either newsprint or writing paper. The company has the distinction of being the first paper mill to introduce pink and high bright newsprint in the country.

The company's mill is located in Kagitapuram in Tiruchirappalli district of

Tamil Nadu, south-west of Madras. The location has advantages in terms of nearness to the sugar mill supplying bagasse, proximity to river Cauvery for sourcing water, access to broad gauge railway track for transportation of coal and a well developed road infrastructure.

The company produced 28 659 mt of newsprint for the year ended 1994-95 against 33 970 mt produced in the previous year. Production of printing and writing paper stood at 64 401 mt, up from 60 663 mt in the previous year. Based on market trend the company reduced the production of newsprint while increasing the production of printing and writing paper. The company notched up sales of Rs 210 crore against Rs 205 crore recorded in the previous year. A rise in the provision for depreciation from Rs 15 crore to Rs 17 crore and a zero tax provision saw the company close the financial year with a net profit of Rs 56 crore against Rs 54 crore. A dividend of 27 per cent has been recommended by the directors.

Entering the export arena for the first time in 1994-95, the company exported 7 168 mt of wood free paper to Egypt, Jordan, Iran and Sri Lanka valued at Rs 1 crore. Imports stood at Rs 195 crore. During the year under review, the company successfully assisted the International Finance Corporation in setting up a bagasse based pulp project in Thailand.

To aid its power needs the company has set up a 15 mw wind farm at an outlay of Rs 50 crore. The company has diversified into the leasing business which is to be further strengthened in the coming years.

The company, using bagasse for production of newsprint and paper, is outside the purview of the National Forest Policy. Moreover the printing and writing paper being produced by Tamil Nadu Newsprint and Paper is subjected to excise duty at a lower rate of 5 per cent against 20 per cent payable by companies using wood/waste paper/bamboo. Against this backdrop, the company's expansion plan is well-timed. The expansion plan involving doubling of capacity from the current 90 000 tpa is progressing fast with a few sections of the project being commissioned in March 1995. Commercial production is expected to commence in January 1996. The estimated cost of the project is Rs 584 crore. The World Bank has sanctioned a loan of US \$ 75 million with a rupee term loan of Rs 100 crore being sanctioned by the IDBI. The company proposes to put in Rs 75 crore through internal generation of funds. It is also coming out with a public issue of Rs 220 crore in which Rs 23.87 crore is being offered to NRIs on repatriation basis.

Liquidity Strain to the Fore

Developments in the foreign exchange market led money market movements in October, aggravating the liquidity strain in evidence since the beginning of the financial year

I Resource Crunch

THE economic scene in October was overwhelmingly dominated by the volatility and uncertainty in the domestic money and foreign exchange markets, essentially reflecting the growing liquidity strain. The rupee depreciated substantially – an ‘over correction for price differentials’ as admitted by the RBI governor – in sharp and quick movements in two bouts within a span of six weeks which finally prompted the RBI to take some measures and to intervene in the market. The pressure on the domestic foreign exchange market combined with the RBI sale of dollars though in dribbles tended to accentuate the already difficult liquidity situation in the money market. Many banks were noticed drawing on their overseas accounts to fund their money market positions. Later when the rates in the call money market firmed up to as high as 85 percent they liquidated their dollar positions for arbitraging in the rupee market.

The signs of the resource crunch were visible early in the current financial year with the growth in bank deposits and other financial assets getting slackened; this trend has since persisted. Aggregate deposits of scheduled commercial banks have increased by Rs 29,677 crore (8.1 percent) over March 17 level against Rs 36,517 crore (11.6 percent) in the similar period last year or, still worse, by a mere Rs 9,516 crore (2.5 percent) over March 31 against Rs 18,420 crore (5.5 percent) last year. The sluggishness in domestic savings seem to be getting further reinforced by the loss of foreign exchange, which since

March 31 has been of the order of \$ 2.56 billion (or worth over Rs 8,000 crore). This is happening at a time when non food credit expansion by banks has been rising at a faster pace than in the previous year (Table 1). Apart from the pressure on commercial bank credit the fiscal situation has remained tight. Despite a sizeable revenue accrual during the first half of the year and despite significant mobilisation through loan floatations, the use of ad hoc by the central government has again crossed the limit of Rs 9,000 crore. Rs 10,610 crore as of October 6 and Rs 9,395 crore as of October 13.

II Money Market Upheaval

Foreign Exchange Market

The developments in the foreign exchange market led the money market movements during October. After about seven per cent loss in the nominal effective exchange rate of the rupee in the first fortnight of September which depreciated the rupee from Rs 31.84 to a dollar to Rs 34.15 to a dollar, the market believed that the rupee had stabilised at Rs 33.50/90 to a dollar. The authorities had sought to make out earlier that this correction was necessary to adjust for the relative inflation rate and the appreciation of the dollar vis-à-vis the other currencies in general; it represented economic fundamentals – a view which did not appear to have been shared by the market. The growing trade deficit following rapid increases in imports, the transfer of non IMF debt service payments to the market and reduced current transfers

have all brought about a shortage of foreign exchange in the market.

The disturbances in the foreign exchange market became self reinforcing in nature. Expecting a fall in the value of the rupee, the importers rushed to the market to cover their positions which were kept complacently open as the rupee was stable at 31.37 since March 1993 when the exchange rates were unified. Upon seeing the rupee depreciate, the exporters naturally held back their remittances. Exporters who had covered forward began to cancel their contracts which further raised the temporary demand for dollars in September. Apparently even a change in the financing pattern for export import trade has accentuated the supply demand imbalances in the domestic exchange market. Earlier under an assuredly stable exchange rate system, exporters were using pre-shipment credit in foreign currency which tends to hasten export receipts and importers supplier credit which tends to postpone the payments. The rupee depreciation altered this scenario with many exporters and importers shifting from foreign currency credit to rupee finance; this has the implication of slower export receipts and faster import remittances, particularly in the context of prohibitively high cost of hedging. Coming on top of an already fund starved market, the additional demand for dollars for various purposes took the market into a tailspin again by mid October and the rupee crossed Rs 35 to a dollar and threatened to cross even Rs 36.

It was at this stage on October 16 when the rupee dollar rate touched Rs 36 that the Reserve Bank of India entered the market to arrest the fall (Graph A). It initially sold small amounts of dollars in the market. Starved of dollars, the market lapped up these small amounts in no time and the rates continued to gyrate in sharp movements. By the third week of October, the nervousness of the market had only accentuated on account of bunching of Diwali holidays. On October 24, the Reserve Bank came in with large amounts

TABLE 1. A FEW MACRO FINANCIAL INDICATORS: VARIATION

GRAPH B: ANNUALISED DAILY 0-MONTH FORWARD PREMIA IN PERCENTAGES FOR THE US DOLLAR IN THE DOMESTIC INTER-BANK MARKET

and finally managed to halt the downward journey of the rupee. Between October 16 and 31, the Reserve Bank had reportedly injected an estimated \$300-500 million into the market, though exact amounts are not known. Importers, who were lulled into exposing themselves to uncovered positions earlier, suddenly pushed up the forward premia, say for the six month from 6 per cent to as high as 13-13.5 per cent (annualised) towards the end of October (Graph B). More significantly, the premia for the shorter maturity forward covers turned out to be as high as 20 per cent for one month or 15 per cent for three months (Graph C).

On October 29, P Chidambaram, minister of state for commerce, who made a strong statement regarding the level of the rupee suggesting that it would not be allowed to go below Rs 34-Rs 34.50 a US dollar, that

stirred the market; he urged the importers not to panic and the exporters to remit their export earnings to augment the supply of dollars. This was immediately backed by Reserve Bank governor C Rangarajan, who sought to reassure the market the very next day that the central bank would stand ready to intervene with the objective of moderating the volatility in the exchange market, though with a proviso "while being consistent with the fundamentals". The projected current account deficit of 1.5 per cent of GDP for 1995-96 was considered reasonable and fully sustainable. The RBI also followed it up with some measures: 15 per cent surcharge on interest charged on the relevant portion of cash credit for imports; increase in rates of interest on NRE deposits; fresh NRE and NRR deposits exempted from CRR; exporters are to be discouraged from

extending credit to buyers beyond 90 days; and importers to repay import creditors only through sale proceeds. After the above assurances and measures, the rupee moved in a narrow range of Rs 34.40/90 and generally stabilised at Rs 34.60, but significantly the forward premia continued to firm up.

Call Money Market

Signs of liquidity crunch were already visible in the call money market in the last week of September when the rates in the call money market had ruled in the range of 16-21 per cent. The RBI intervention to arrest the fall in the rupee's exchange rate further affected the domestic money market which was already squeezed of liquidity. The result was that, by the end of October, the call rates zoomed from 15-20 per cent to 75-80 per cent requiring the RBI to intervene to even

out the extreme scarcity of funds. By the month-end, the RBI had provided support to the money market to the extent of Rs 2,500-3,000 crore. The daily quotations of call money rates during October always remained above those of September (Graph D).

The month of October began with three holidays at a stretch after a half-a-day's trading on Saturday, September 30. The first week of October naturally opened on a firm note at 15-18 per cent. In addition to holidays, the firmness in the rates was also attributable to Rs 1,500 crore flowing out of the system towards payment of the floating rate bonds and 91-day treasury bills. It was reported that banks needed to keep additional CRR during this week on account of inflated net demand and time liabilities on September 30 due to the bulge in bank deposits arising from half-yearly closing.

During the next week, Rs 1,120.66 went out of the system on account of payment of the second instalment of the partly-paid security issued in September. Although this was the second week of the reporting fortnight, banks continued to borrow at high rates as many of them had left their positions uncovered during the first week in the hope that the rates would drop in the second week.

These banks were seen to be borrowing at 23 per cent on October 12 as it was the last day for CRR coverage and one-day repo was banned; some of them even borrowed unusually at 7 per cent on the reporting Friday.

The market opened at a high of around 18 per cent during the third week. The Reserve Bank intervened in the market to the extent of Rs 2,000 crore during this week to cool the market. In addition, Rs 659.50 crore were expected to flow back into the system through the redemption of 364-day treasury bills on October 27.

Though the call rates fell during the reporting week ended October 27, the extent of volatility as represented by the coefficient variation of the highs and lows in fact rose rather

significantly (Table 3). The relative fall in the rate was on account of some easiness in demand for funds, especially from the government which had not come to the market after the October 14 flotation. It was also reported that State Bank of India was a large lender in the market during this week which softened the rates.

The last week of October, which was the first week of the reporting fortnight closing on November 10, however, saw extreme pressure on the call rates which soared dramatically to a high of 85 per cent in a matter of just two days (November 1-2). The rates were also extremely volatile with intra-day gyrations ranging between a peak of 75 per cent and a slump at 25 per cent. Even

GRAPH C: ANNUALISED DAILY 1-MONTH, 3-MONTH AND 6-MONTH FORWARD PREMIA IN PERCENTAGES FOR THE US DOLLAR IN THE DOMESTIC INTER-BANK MARKET

the RBI intervention in the foreign exchange market which had absorbed rupee resources contributed somewhat to this. Moreover, a state loan flotation of Rs 1,500 crore to be held on November 6, the bank's commitment to the IDBI issue (Rs 1,100 crore) which fell due in the first week of the reporting fortnight, and the third instalment of Rs 1,100 crore towards the partly-paid security due for payment in the second week of the reporting fortnight, would together soak up at least Rs 6,000-7,000 crore from the system thus threatening to cause an acute shortage of funds in the immediate future. The Reserve Bank intervened in the market to the extent of Rs 3,000 crore (outstanding as on November 4) in just two days through reverse repos with

DFHI and STCI. Banks also reported to have availed of refinance against government securities to the extent of Rs 500 crore during these two days.

Open Market Operations

In keeping with the tight monetary policy, the open market operations of the Reserve Bank continued to remain passive. The securities it offered for sale were long-dated securities while the market completely lacked interest in these and instead traded in short-dated securities due to the liquidity crunch. There was only one purchase deal of Rs 5 crore in a floating rate bond which the RBI purchased at par.

III

Primary Market Operations

Dated Securities

Only one fresh dated security was floated by the government during the month. Issued on October 14, this was the second series of the 13.5 per cent two-year security floated earlier this year. The paper aimed at mop up Rs 3,000 crore being issued on the same day when redemption of the 12 per cent 1994 paper was due. The latter paper was to be redeemed actually on October 15 but was redeemed on October 14 as the next day happened to be a Sunday. It was reported that the ministry of finance and the RBI were 'persuaded' public sector banks to reinvest the redeemed amounts in the new 13.5 per cent paper, with even amounts being indicated to each bank. The paper was naturally fully subscribed. Financial institutions, such as the LIC, and the UTI were reportedly large buyers of this paper. The anxiety of the government and the Reserve Bank to borrow from the market was later explained when it was found that, as on October 6, the government's resort to ad hoc borrowing had again crossed the Rs 9,000 crore limit.

With the above floatation, the government has achieved a gross market borrowings of Rs 21,882 crore so far during the current fiscal year (Table 4) as against the budget amount of Rs 41,000 crore.

364-Day TBs

The Reserve Bank raised a meagre amount of Rs 87 crore out of bids worth Rs 256 crore received in two auctions of 364-day Treasury Bills during October. The cut-off yields on the TBs have shown fractional increases from 12.91 per cent towards the end of September to 12.93 and 12.94 per cent respectively, in the two October auctions (Table 5).

GRAPH D DAILY TOP END QUOTATIONS OF CALL MONEY RATES
SEPTEMBER 1995 AND OCTOBER 1995

Incidentally in September the government issued a floating rate bond (FRB) at a rate of interest linked to the cut off yields on this instrument

91 Day TBs

The government raised a total of Rs 2,000 crore through four auctions of 91 day TBs during October but with a significant firming up of the cut off yield from 12.68 per cent in the final auction of September to 12.88 per cent in that of October (Table 6). The

share of non competitive bidders in this at Rs 1,161.08 crore was more than 50 per cent. However while initially these bidders contributed a large amount their share gradually fell with their contribution getting reduced only to Rs 15.06 crore in the month's last auction as against Rs 800 crore in the first auction. The decrease in the amount bid by non competitive bidders was compensated for, to a small extent, by the increased interest from the competitive bidders who bid larger amounts towards the month end. The renewed

interest from competitive bidders in this paper was on account of the shortfall faced by many banks as a large amount of TBs were redeemed over the past couple of months and the need to re build short term investment portfolio by them to meet the ensuing busy season credit demand. Yet the Reserve Bank could neither avoid a gradual increase in the yields on this paper nor could it avoid devolvement on itself which totalled Rs 188.73 crore in the last two auctions of the month.

PSU Bonds

With the impending disinvestment of equities by the government of four public sector undertakings (ninth round of bidding first this year) in an environment of liquidity shortage and rising interest costs, not many other PSUs approached the market with new bond issues. Apparently these four equity auctions evoked very poor response. Successful bids as low as Rs 168.62 crore against the earlier expectation of about Rs 2,000 crore, there is a budgetary target of Rs 7,000 crore to be fulfilled.

Amongst the few other floatations, the Nuclear Power Corporation (NPC) floated a six year bond for Rs 100 crore at 16.25 per cent. The issue closed on October 16 and was reported to have attracted only Rs 50 crore despite attractive conditions. NHPC too was less fortunate and could raise only Rs 66 crore as against a target of Rs 300 crore through its taxable bond at 16.5 per cent. IRFC was in the market in the last week of October with its tax free bond worth Rs 250 crore at 10.50 per cent and was reportedly doing well. ICICI was in the market to privately place Rs 200 crore at 15.5 per cent whereas the IDBI with its deep discount and

GRAPH E YIELD CURVES FOR 364 DAY TREASURY BILLS AND GOI SECURITIES WEIGHTED AVERAGE FOR OCTOBER 1995

regular bonds could raise only Rs 70 crore in two weeks. NABARD and IRBI approached the market with their 10-year bonds at the same 14 per cent rate of interest for Rs 83.50 crore and Rs 87.50 crore respectively. Meanwhile the 17.5 per cent bond of issue of Krishna Bhagya Jala Nigam (KBJNL) has obtained its target amount of Rs 150 crore because of the high yield and also because of Karnataka government guarantee. This issue in fact compelled other PSUs to push up the yield offers.

Gujarat Lease Finance tapped the market to raise Rs 50 crore by privately placing two short term (15/18 months) papers. The Gujarat Industrial Investment Corporation was in the market to raise Rs 55 crore.

As resources were scarce and the cost high in the domestic market, IDBI and ICICI looked towards international markets. Both had sought extension of time limit on their external commercial borrowings from the government.

Tapping New Sources

Due to continued liquidity shortage in the financial system, PSUs could raise only about 10 per cent of their targeted market borrowing of Rs 6,000 crore during the year. While some PSUs have started tapping the new sources like RRBs, PFs, etc., many others have shifted to lease finance for their fund requirements. The latter PSUs are IRFC (Rs 1,800 crore), PFC (Rs 250 crore) and MTNL (Rs 1,150 crore). Lease finance seemed to be the preferred avenue as it offered tax shelter to the investors, most of whom – be they corporates, financial institutions or even banks – were showing trends of high profits in the first half of 1995-96. The Reserve Bank has apparently clamped a ban on such deals being routed

through banks by finance companies as it amounted to double financing of the same leased assets.

Also while the primary market activities were mostly concentrated in high rate taxable bonds, the eventual rescinding of Section 80M benefits under the Income Tax Act on inter-corporate dividends gives a much needed fillip to primary tax-free bonds as corporates are planning to replace preference and equity share holdings by tax-free PSU bonds. Accordingly, PSUs have been bracing up to restructure their bonds in terms of put options and discounts and such other facilities for the prospective corporate subscribers.

Commercial Paper

Despite an increase in the number of companies rated by CRISIL, many preferred not to enter the CP market as ultimately funds raised through this instrument would lead to reductions in their existing cash credit limits. During the month, a total of Rs 186.5 crore worth of CPs were floated, the largest being Rs 100 crore by Infrastructure Leasing and Financial Services (ILFS). Voltas and Pfizer were amongst the companies to issue their CPs. Kotak Mahindra was reported to have rolled over its commercial paper worth Rs 6-7 crore on October 31 at 16.5 per cent.

The primary CP rates which were in the range of 13.5-14.25 per cent towards the end of September were hiked to the higher range of 14.5-15.5 per cent towards the second fortnight of October.

ICD Market

The inter-corporate deposit market was reasonably stable although the rates were high during October with low demand for funds. AAA (triple A) companies could borrow in this market at 17.5-18.5 per cent whereas AA

(double A) companies could borrow at 25 per cent. Interestingly, scarce resources and the desire for earning better returns on small surpluses have led a few leading finance companies to offer syndicated inter-corporate deposits.

Other Markets

There were very few issues of certificates of deposits (CDs) when they were issued, the ruling rates were 14-14.5 per cent. Further, an issue of pass-through certificates of Rs 9.36 crore by Alarcity Housing noticed in the last month's review was received well in the market.

IV Secondary Market

Disturbances in the foreign exchange and money markets adversely affected the secondary market operations in money market instruments, with the size of secondary transactions dwindling to the lowest levels in months except for repo transactions in government securities associated with the funding requirements in the call money market. Total traded amount, as shown in the RBI's SGI accounts (excluding repos), was of the order of Rs 1,760 crore during October as against Rs 3,323 crore during September and Rs 3,599 crore in August (Appendix Table). Likewise, the actual traded size on the National Stock Exchange (NSE) was considerably less at Rs 480 crore during the four weeks of October as against Rs 1,164 crore in September (five weeks) and Rs 1,354 crore during August (four weeks).

Government Securities

The redemption of the 12 per cent 1995 paper on October 14 created a shortage of short term paper in the market towards the end of the month. As a result, the focus in the secondary market for dated securities shifted from short term paper to longer duration maturities. Initially, there was considerable interest in 12.75 per cent 1996, 13.5 per cent 1997 and 12 per cent 1999, as also in Zero coupon bonds 1999 and 2000. There were small trades in 91-day TBs which had become active once again in the secondary market since late September. There was not much interest in 364-day TBs. Prices of short duration securities suffered an erosion due to firming up of interest rates, while long duration papers stood their ground. Price of 12.75 per cent 1996 fell from Rs 101.19 on September 30 to Rs 99.57 on October 30, while that of 14 per cent 2005 (II) edged up from Rs 101.10 to Rs 101.27 during the same period.

Yield Curve

Apart from the dwindling of transactions in the secondary market, there has occurred some significant disturbance in the yield curves for 364-day TBs and dated government

) means no trading YTM = Yield to maturity in per cent per annum CY = Current yield in per cent per annum * Yield rates of these sub groups of TB and dated securities have been used for the graphs @ The SGL data show YTM gross of vouchers for tax deducted at source (TDS) these negative YTM's are not included in the graph

Notes: 1) Yields are weighted yields weighted by the amounts of each transaction 2) Current yield has not been worked out for treasury bills

securities Curve I which depicts YTM's of all government securities transacted during the whole of October in an ascending order of their maturities shows a very gentle upward movement. On the other hand the yields for 364 day TB's depicted in a similar manner in the same curve show a total inversion due to an acute demand for TB's maturing towards the end of the year.

Indices on Returns and Capital Appreciation

The bond index computed by the ICICI Securities covering government securities of one to ten year duration which have fixed coupons and are being traded shows that while the composite return that the government papers offer over the base period (August 1 1994) has risen by about 5.3 per cent until the end of October the capital value of the papers depreciated by about 6 per cent

suggesting a rise of about 11.3 per cent in the yield rate (table below)

1 SEC BOND INDEX (I BEX)			
Total Return Index	Change	Principal Return Index	Change
01.08.94	1000.00	1000.00	
31.10.95	1057.75	979.94	-60.06

PSU Bonds

Though trading in PSU bonds continued to be dull there has occurred a shift in favour of taxable bonds during October probably due to the rescinding of 80 M provisions as cited above. Total traded amount in taxable bonds in September was Rs 19 crore (five weeks), whereas in October it was Rs 44 crore (Table 7)

The YTM for the PSU bonds displayed an upward trend from 16.57 per cent in the first week of the month to 17.91 per cent towards the end of the month. No much selling pressure however was seen.

Commercial Paper

Considerable interest was evinced in the secondary market in CPs during the last week of October. NSE screen showed that Rs 43 crore were done in four CPs towards the last two weeks of the month. The papers traded were those of SAIL, Hoechst, Philips, Tube Investments and Voltas.

[Statistical compilations and graphs for this note have been done by V P Prashant. Paramita Debnath has prepared background notes on private debt instruments and money market ratios.]

INSTITUTE FOR FINANCIAL MANAGEMENT AND RESEARCH, Madras

Faculty Positions

Institute for Financial Management and Research (IFMR) invites applications from suitable candidates for full-time faculty positions. Appointments will be made at the level of **Professors, Associate Professors** and **Assistant Professors**. A few research positions are also available.

Now in its 25th year, IFMR has been a pioneer in financial management education and research. It offers executive development programmes for Indian and International participants, Part-time Postgraduate Diploma in Financial Management (Equivalent to MBA in Finance) approved by AICTE and prepares students for the Ph.D. degree of the University of Madras. It supports research by its faculty in finance and economics, funds for which come from both national and international organisations.

Persons selected will be joining a team of multi-disciplinary faculty members and will need to participate in all activities of the Institute. Those with interest and commitment to research will be preferred if they have adequate and proven teaching abilities.

QUALIFICATIONS

Ph.D. with specialisation in Finance / Economics / Management. Persons with industrial experience and with MBA in Finance or CA or ICWA would also be considered.

EXPERIENCE

Applicants should have a minimum of five years teaching, research or industrial experience. Those joining at the Assistant or Associate Professor level will be evaluated for promotion based on their performances. Faculty members have annual work plans and annual increments are based on merit.

SCALES OF PAY

Professor	Rs. 7500 – 11000
Associate Professor	Rs. 5800 – 9500
Assistant Professor	Rs. 4300 – 7200

- ◆ These scales which include cost of living components are being revised and will be competitive with other prestigious Management Institutions.
- ◆ In addition, HRA, Contributory PF, Gratuity, Pension, Medical benefits and Leave Travel Allowance as per Institute's rules are also available.
- ◆ All appointments will be on contract for three years and will be renewable depending on performances.

Apply in confidence with detailed CV, three references and list of publications to :

NEW DELHI

Liberalisation Chicken Coming Home to Roost

B M

The fragility of the external payments position, exposed by the market-driven devaluation of the rupee and the depletion of foreign exchange reserves, has shown that the priority assigned to external liberalisation in the government's economic policies is wholly misconceived and is fraught with tragic consequences.

CONTRARY to official claims, the rupee is still very much under pressure and is likely to sink further before it stabilises at about Rs 40 to a US dollar. Stabilisation at that level too is likely to result in substantial drawing down of the exchange reserves. The reserves are reported already to have been eroded by over two billion dollars from the peak level touched early in 1995. The fund maintained by the Reserve Bank of India to contain losses on account of fluctuations in the value of the rupee in relation to foreign currencies in the open market has come down from over Rs 7,500 crore in June 1995 to about Rs 4,000 crore. The balance of payments position has come under strain at a time when the current account deficit is widening and the debt service obligation is large and pressing.

The build-up of exchange reserves, from a low of \$ 1.1 billion in June 1991 to \$ 20 billion at the end of 1994-95 was claimed by the government as a great achievement of its economic policy and management. That the burgeoning exchange reserves were putting a burden on the overall economic, and in particular monetary, situation was played down. That such measures as partial convertibility of rupee in early 1992 and abolition of dual exchange rate system later that year resulted in further devaluation of the rupee was also dismissed as not worth notice. The assertion of commerce minister Chidambaram that after the latest 'correction' of the exchange parity to neutralise the effect of inflation in the last two years "the rupee can only appreciate now" lacks credibility. It may not be amiss to recall a similar assertion in July 1991 of finance minister Manmohan Singh, immediately after the two-step devaluation of the rupee, that the "rupee can henceforth only gain". Chidambaram is going to be proved as glaringly wrong as Manmohan Singh.

When the exchange reserves were burgeoning, the governor of the Reserve Bank had claimed that "while earlier the loans taken [from foreign sources] had been

spent, they have now been consolidated and this reflects in the forex position". An RBI expert group has recorded that over \$ 24 billion were purchased from the market during 1993-95 which resulted in the foreign currency assets of \$ 20 billion. This was the reason for the stability of the exchange value of the rupee during this period. The inflow of foreign exchange in various forms tended to strengthen inflationary pressures which surfaced sharply in 1993-94 with a return to double-digit inflation even as growth impulses in the economy, especially growth of industry, remained sluggish and the fiscal position of the government deteriorated. Even the World Bank in its country report on India referred critically to the problems thrown up by the build-up of exchange reserves in this fashion. It also frowned upon the low level of imports by India in spite of the liberalisation-globalisation policy accepted by the government.

After quantitative restrictions on imports were lifted, there was to begin with, what the *Economic Survey* of the finance ministry called, "normal growth of imports". The trade gap widened to over three billion dollars. Subsequently, however, imports began to dip and the negative trade gap shrunk in 1993-94 to less than one billion dollars. There were noises that the RBI was artificially keeping the rupee 'stable' while costs of production in the economy were rising. There was a demand in some quarters for measures to depreciate the rupee to attract foreign capital, step up investment and promote exports, though there are also fears that inflationary pressures might become unmanageable.

After the government floated the rupee and made it convertible on trade account early in 1993, there was every possibility of the rupee suffering further devaluation. This would have been welcome to exporters but was bound to have adverse impact on supplies and prices in the domestic market. The value of the rupee was kept 'stable' by 'sterilising' exchange reserves but this was by itself not

adequate to check inflation, step up investment or impart a thrust to exports even as the problem of servicing of the country's huge foreign debt became more intractable. This compelled the government to be cautious in rushing into full convertibility of the rupee. But it has not been able to withstand the pressure for opening up the Indian market for import of consumer goods, even as a meaningful way of utilising the accumulated exchange reserves for productive purposes and expansion of economic infrastructure has eluded the government. It is not surprising, therefore, that as soon as signs of industrial production picking up emerged after a prolonged hold up, a piquant situation has appeared in which both the exchange reserves and the exchange value of the rupee have come under pressure.

The pressures on the rupee and exchange reserves have been attributed to shortage of dollars in the market to finance the import needs of industry. The speculative rush of importers for dollars is supposed to have aggravated the position. The RBI, anxious to prevent depletion of exchange reserves, is thought to have made matters worse by the decision that foreign exchange for servicing the outstanding foreign debt not only of the corporate sector but the government too would henceforth have to be raised from the market and would not be paid out of the reserves held by it. This is said to have triggered the slump of the rupee. While finance minister Manmohan Singh has been unusually reticent, the minister of state under him said that the rise in industrial output and implementation of new projects entailing large-scale imports of equipment and raw materials had created a huge demand for foreign exchange. This had also activated "strong lobbies" for disturbing rupee-dollar balance, according to him. The problem, it is admitted by exchange dealers, will be compounded because of the concomitant rise in the rupee costs of imports and fall in foreign exchange earnings from exports. Either way the impact on the domestic market of the devaluation of the rupee is bound to be inflationary. Exporters, at the same time, have tended to park their earnings abroad, as they believe that rupee will fall further. The current account deficit is widely expected to be over \$ 5 billion this year. Combined with further devaluation of the rupee, there is bound to be a sizeable depletion of exchange reserves. This will add to the political woes of the Rao government in the election year. The government will be forced to revert to the policy of deflating domestic economic activity and a slump in the industrial sector is very likely. The periodic devaluation of the rupee is bound, in popular perception, to expose the vulnerability of the Indian

economy as a result of its mindless exposure to global market forces

The problem may not have yet acquired crisis proportions as in 1991. But the so-called economic liberalisation and globalisation policy, misconceived and misdirected of the Rao government if persisted with will surely lead to a similar denouement. The indicators are already ominous. Deterioration of the external payments position may also create a situation where there may be large scale flight of capital from India. The much advertised bid to attract foreign capital especially portfolio investment in stocks and shares to step up investment for the growth of the economy expansion of infrastructural facilities is losing momentum. This is not happening because of the fishy Enron deal which has been questioned and exposed. The loss of international confidence in the ability of the Indian market to absorb profitable foreign investment is really the problem because domestic savings and investment have not picked up.

It is not fortuitous that foreign trade gap is again widening. The drive launched with much fanfare to accumulate foreign exchange reserves and open the Indian market for foreign capital, technology goods and services while it has increased external debt has neither augmented resources for investment nor stimulated efficient economic activity and competitive strength of Indian enterprises in the domestic or the global market. On the contrary multinational corporations have secured special privileges and a commanding position to turn Indian business interests and skills technological managerial and marketing into their commission agencies. The chief of the Confederation of Indian Industry pompously declared the other day in a press interview that majority shareholding in so called joint ventures was passing into the hands of foreign companies and this what he called 'strategic alliances' was the way to the future for Indian business. In this arrangement the Indian partners provide their distribution networks in the domestic market plus of course political contacts and the foreign partners bring in capital and technology.

The fragility of the external payments position exposed by the market driven devaluation of the rupee and depletion of exchange reserves has clearly shown that priorities given to liberalisation in the official structural adjustment process is wholly misconceived. Domestic liberalisation which must be a well planned and well directed easing of the discretionary bureaucratic control system to activate domestic enterprise and skills to promote savings and efficient investment must be the first concern of the state even as external liberalisation or what is euphemistically called globalisation of the

economy has to be carefully regulated. To supplement domestic investment with foreign inputs to improve the efficiency of domestic business enterprise in the public and private sectors. The examples of Japan and South Korea are often cited in this context. It was in some countries in South America that external liberalisation was given priority in the economic policy package. This had disastrous consequences as in Mexico. India too is being attempted to be pushed on to the disastrous Mexico route.

The Rao government not derived proper lessons from the Mexico fiasco. The key issue that the Mexico experience throws up is that failure to undertake efficient mobilisation of domestic resources human and material and helpless reliance on foreign capital is dangerous. The upshot of the Mexico crisis has the plan for pumping in of further billions of dollars as credit to bail the country out of the external payments crisis. This involved mortgage of the oil wealth of Mexico its prime national asset to US corporations which further weakened Mexico and its ability to get out of the payments crisis and return to the growth path. The position of Mexico is only worsened in the last one year after the ten year long so called reform of its economy. The point is that the concessions already offered by the Rao government and more in the offing to attract foreign capital especially in the energy and infrastructural sectors are tending to be the beginning of the process of going the Mexico way. The build up of exchange reserves by foreign borrowing and inflow of foreign capital huge as they may appear to be at some point of time is no assurance that a relapse of the balance of payments crisis and flight of capital cannot be suddenly brought on by manipulating capital movements to and out of India. But the government even in the midst of the growing pressure on the rupee and the emerging payments crisis has chosen to go for large scale CKD and SKD import of luxury cars for assembly in India is applauded in some interested quarter as

a move to expand the auto industry in India. Just as in respect of foreign power plants which guaranteed high returns on investment, the move for foreign cars and consumer durables to be imported or assembled in India will entail a huge drain of foreign exchange, not only in the future and put India under severe external payments strain and periodic foreign exchange crisis.

The secretary in the finance ministry, while tracing the background to the latest fall in the exchange value of rupee, admitted that investment was low in 1993 and picked up only in 1994 which at once brought pressure on the rupee. The deficit on current account is growing and is expected to be 1 per cent of GDP in 1995-96 against 0.5 per cent in 1994-95. A current account deficit of 1.5 per cent of GDP may appear to be within manageable limits. But a pick up in investment and growth in India has already got linked to rise in current account deficit and pressure on rupee. This is clearly the implication of Montek Singh's statement sets not only a limit to the growth prospects of the economy but also portends serious payments problems in the event of growth picking up. The finance secretary smugly talked of India not facing a Mexican plight. But the Mexico experience must be taken seriously as a warning bell for India and its self-styled reformers and globalisers. After all as Montek Singh stated Mexico embarked on its reform programme early in the 1980s a decade before the Rao government was pushed to tread a similar road. It took nearly a decade and half for the Mexican economy to plunge into crisis. The globalisers abroad and in India have begun to canvass with even greater vehemence after the external payments problem has become more difficult that the opening up of the Indian market for the entry of foreign capital especially in the infrastructural sectors on a still bigger scale than so far the only solution of the payments crisis. The prescription would be laughable if it were not so fraught with tragic consequences.

'Private Banking' and Depreciation of the Rupee

Kannan Srinivasan

The recent volatility in the foreign exchange market has been discussed almost entirely in terms of the Reserve Bank of India's behaviour, whether it intervened 'in time' or in the right way, and so on. But considering the scale on which portfolio funds and 'other capital' have entered India in the last two years, the recent developments need clearly to be looked at in the context of international capital flows

THE current panic in India's foreign exchange markets ought to alert us to the fragility of the base on which the liberalisation programme has been erected. The single demonstrable achievement of the 'reforms' programme has been the build up of the foreign exchange reserves, but that build-up has taken place due to inflows of hot money – portfolio investment, the entry of funds through the havalas route, and such mysterious channels as the 'other capital' head in the capital account of the balance of payments. Such capital is particularly prone to fly abroad again whenever there is a foreign exchange crisis.

The press has reduced the discussion of the recent volatility in the foreign exchange market to one of the RBI's behaviour, whether it intervened 'in time' or in the right way, and so on. But portfolio funds of the order of \$ 7 billion entered India during April 1993–March 1995, and other capital accounted for another \$ 4 billion or so during the same period. So we clearly need to look at the recent crisis in the context of international capital flows.

In the last three years, there has been much comment on the increased volatility of such flows. But one aspect has been neglected. That is the increased importance of 'private banking' to the international banks. This is particularly relevant in the case of India. It is well known that most of the portfolio investment and NRI deposits are the funds Indians have taken abroad. Another avenue for such flight capital's entry and exit is through the under-invoicing or over-invoicing of trade (the 'havalas' route). It is the movements of such flight capital that will determine whether and how fast the rupee will depreciate.

DEBT CRISIS

The global phenomenon of such flows of money arose from the rescue operation for the international banks performed after the LDC debt crisis. Contrary to popular perception, this debt has been no disaster for the international commercial banks. Their

losses may be outweighed by the returns of the original loans to the third world combined with the important new business opportunities which have arisen as a direct consequence of that lending.

During the years 1972–1982, sovereign long-term lending was significantly more profitable than most OECD business. As countries borrowed amounts they were unlikely to repay, short-term lending at very high interest rates earned handsome returns. The management of flight capital boomed in 1982 when Latin American countries stopped repayment. It has flourished ever since.

As the Fund Bank restructuring gathered pace, banks launched asset management companies to invest in third world stock markets. They developed profitable stock market, consumer and merchant banking businesses in those countries. LDC profits have constituted a major portion of overall banking profits. Some banks have made money nowhere else.

At hearing of the Senate Subcommittee on International Finance and Monetary Policy, when asked (February 8, 1989) whether 'a lot of our banks really made money on the front end of these loans, a lot more money than a lot of us realise', Jeffrey Sachs – not known to be excessively tenderhearted to the third world – replied

all of the banks, everything (sic) in this country is (sic) out of the crisis right now. They did get the large front-end fees at the time. Indeed in the early reschedulings, the name of the game was when the country got into trouble, raise the spread for a few years. Finally that's been whittled down, but you know it is interesting with the hundreds of commercial bank restructurings, there hasn't been a single case of a submarket interest rate, not one single case. There's been a positive spread on every single restructuring that has been made. That is for 42 countries, each of which have (sic) had two or three rounds at this point.

For some years after 1982 it seemed that third world borrowers might default. From

this the banks have learnt the importance of avoiding long term commitments. All five important areas of LDC business done today – consumer finance, merchant banking, institutional investment, private banking and short term lending – involve limited and very temporary exposure to the uncertainties of world trade and third world economies, and provide great flexibility of entry and exit. Today's boom in emerging markets, and other swift flows of international capital is a direct outcome of that original involvement in LDC activity – modified to minimise risk.

PRIVATE BANKING AND CAPITAL FLIGHT

A significant part of this swift global movement of capital has been intermediated by the private banking operations of international banks. Private international banking – as Columbia University professor *Karin Lissakers* calls it, – the banking community's euphemism for the solicitation and investment of flight capital.

Money borrowed by third world countries returned to the international banking system even when – indeed especially when – countries defaulted. Inflows of flight capital from wealthy private individuals in defaulting LDCs have more than offset the amounts of money lent to those countries. Such capital has generally been taken out of a country in evasion of foreign exchange regulation. Often it has been criminally acquired from trade such as narcotics, or in bribes and commissions for contracts. These funds are re-lent or reinvested. Flight capital may even serve the same purpose in providing liquidity to the international banking system as did OPEC funds during the 1970s and 1980s.

Asia and Latin America provide the major growth in private international banking for these banks worldwide, not the OECD economies. In virtually every country in southern and central America, political and economic uncertainty persists. In Asia such risk is most strongly evident in the Philippines and south Asia.

To the banks, the first benefit is one of liquidity. For instance, such client assets exceeded \$ 52 billion for Chase Manhattan Bank alone in FY 1992. This is an amount equivalent to nearly its total deposit base of \$ 53.7 billion.

Now private bankers estimate that between 20 per cent and 40 per cent of such assets managed by a bank end up in its own deposit base. Private bankers recommend a prudential ratio of diversification of investments between real estate, bonds, money market funds, stocks and bank deposits. A significant percentage would also transit through the bank's deposit base as it must be deployed in one or other of these investments.

Chase's Annual Report (1992) points out that a dramatic growth in client assets – of 10 per cent every year – puts "us in the top 10 largest financial institutions serving the money management needs of the wealth market... The global private banking business has tremendous growth opportunities, particularly in Asia and Latin America." It estimates the private international banking market worldwide at "\$ 10 to \$ 15 trillion and no single institution can claim a dominating share". Its 1991 Report says: "Because private banking clients come from all over the world, Chase's private bankers are multilingual. The Chase approach to private banking is to build trusting relationships, ensure confidentiality..."

Similarly, in the case of Citicorp, such private banking clients provided funds of \$ 75 billion for investment – equivalent to nearly half of its deposit base of \$ 146.47 billion. Its 1992 Report says: "The Citibank Private Bank provides an integrated wealth management service through long-term, personal client relationships serving wealthy individuals, their families and, as appropriate, their businesses. In 1992, the Private Bank's worldwide client base expanded by 5 per cent to 74,000, and total assets under management rose 7 per cent to 75 billion ... The largest non-Swiss private bank in the world .. with 91 offices in 28 countries". The Private Bank claims to deliver Citi's global expertise in the process of "protecting and enhancing its clients' real wealth". In 1991 Citibank noted that "... private banking activities in Asia and Latin America achieved record earnings... private banking combined net income for these regions increased 15 per cent over 1990 results".

Bankers Trust manages \$ 25 billion in private banking assets. Salomon Brothers says in its analysis of BT (March 1992): "the company's network extends beyond its four US offices – in New York, Chicago, Miami, and Los Angeles – to London, Hong Kong and Switzerland. The target market remains cross-border money flows" which can be "serviced from a limited number of locations".

American Express Bank (AEB) has seen capital flight money increase at rates of 15 per cent to 18 per cent through the late eighties early nineties. Such 'client funds under management' have actually exceeded the total deposit base of the bank. Five years ago (1987) its Annual Report declared that: "Private banking is the cornerstone of the American Express Bank strategy, in line with the bank's focus on low-risk, fee-generating services... private banking client holding grew 18 per cent to \$ 12.2 billion." By the following year such 'client funds under management' rose to \$ 14.29 billion. As the chairman boasted, these had actually tripled in five years – from \$ 4.5 billion

in 1983. As in the previous year, this exceeded the bank's entire deposit base – 'customers' deposits and credit balances' which amounted to \$ 13.035 billion. That "strong growth pattern" continued. By December 1989, capital flight money increased 18 per cent to \$ 16.4 billion. By 1990, however, the bank had become more coy. No specifics were provided (in numerical terms) of private banking clients or their assets.

The bank restricted itself to advertising its services. That Annual Report begins: "American Express Bank will become the world's pre-eminent exclusive global financial institution for wealthy individuals. We will meet their needs 24 hours a day, seven days a week, anywhere in the world, for wealth accumulation, wealth preservation and prestige convenience by providing the personal financial services they need to manage their wealth and to ensure access to it wherever they may be..." Appropriately enough this manifesto is called its *Vision Statement*.

Indeed this and other third world business have offset the losses that Amex and other banks have made in the OECD. Its \$ 205 million loss in the third quarter of 1992 was the direct outcome of US consumer credit card defaults. Similarly, the last time American Express posted a loss (of \$ 628.5 million in the first quarter of 1990) that arose entirely from OECD business.

FLIGHT CAPITAL TO THE RESCUE

Yet banks provide no account of what portion of the flight capital they manage actually ends up in their own deposit base. And the balance sheets of the important Swiss and English banks – which depend significantly on flight capital – contain little or no discussion of this activity. The US banks are relative newcomers to this business, having only developed it seriously in the last 20 years. But London and Zurich are very old centres of capital flight money. They do not need to advertise. National Westminster discreetly guides such clients to the international private banking business of its subsidiary Coutts and Co, headquartered at Zurich.

The Bank for International Settlements (BIS) maintains data on all deposits with BIS-reporting banks made by nationals of any country. But it does not list fiduciary assets (managed funds) or other assets such as real estate. So it is difficult to make assessments of the capital flight specific to a particular country. BIS data showed (1992), for instance, outstanding Brazilian debt at \$ 61.563 billion, but deposits with BIS reporting banks at only \$ 24.257 billion. Similarly, Mexican deposits are stated to be \$ 27.995 billion when private

Mexican funds abroad are believed to exceed \$ 70 billion. BIS data excludes trust funds and the majority of assets are in such trusts.

Such capital has been significant in economies such as the US and the UK both as a source of invisible earnings and of investment in government securities. Low taxes for non-resident investors encourage flight capitalists to take money out of heavily-indebted countries, third world flight capitalists whose countries have to reschedule their loans to US banks, play the ironical role of being lender to American banks, and to the US government, financing its budget deficit.

In both the case of the OPEC crisis and the LDC debt crisis, a perceived threat to capitalism became a significant asset. OPEC profits would, it was claimed, wreck the international financial system. Petrodollar funds flooded the banks beginning in 1974. Yet recycled, they provided the basis for great financial expansion. The same has been true of flight capital from the third world.

FLYING DUTCHMAN

This is what I had written in a newspaper in January 1994 when reviewing a research paper produced by Barings Plc: "So now India's foreign currency reserves and balance of payments depend critically on the perception of foreign institutional investors about this country; and how this fits into their overall logic of deploying their funds around the world." Quoting from the Barings' paper: "Two separate and parallel spheres of money exist – an industrial circuit and financial circuit... The more cash that exists in one circuit the less there is available for the other. Consequently, strong economies do not always have strong stock markets and weak economies do not always have weak stock markets; relative liquidity levels are important."

I summarised the paper as saying that "the single most important concern in this model is global flows of liquidity. Investors should then ride the tide of liquidity flowing into one economy after another in different places in the world. And they should exit when international capital flows out... The short-term nature of such capital flows should warn Indian policy-makers. Is this a reliable source of investment that will develop India's economy?"

"...International investment has recovered from the LDC debt crisis, the leveraged buy out crisis, the consumer finance and real estate disasters. It is now trying its luck with the emerging market funds. Bad news for India."

Personal Laws: Promoting Reform from Within

Imtiaz Ahmad

In the face of the enormous difficulties implicit in the enactment of a uniform civil code, the appropriate course would be for the communities themselves to undertake to rationalise those aspects of their personal laws which stand in conflict with constitutional provisions or fail to pass the test of equity, justice and good conscience. Both the initiative for reform as well as the creation of institutional structures for building consensus over such reform have to come from within the different communities.

UNIFORM CIVIL CODE (UCC) has become a contentious issue. The protagonists divided among a number of different positions insist that UCC should be enacted. The antagonists, among whom Muslims are the most vocal and articulate, are adamant that the democratic framework guarantees them the freedom and right to adhere to their personal laws and consequently remain opposed to enactment of UCC.

Even though a constitutional directive the enactment of UCC is fraught with problems. For one thing, little clarity exists as to the contours of UCC: whether it would be limited to issues of inheritance, marriage and divorce etc. or cover other aspects as well, including the discriminatory HUF tax provisions. Second, the legal diversities existing in the country are so massive (in some places the law changes every two hundred kilometres) that any attempt to enact UCC will generate widespread resentment and strife. Third, the existing laws are founded on at least four clearly distinct jurisprudential philosophies. Enactment of UCC cannot be based on any arbitrary selection of one jurisprudence over another (there is no basis for presuming, for example, that one jurisprudence is superior to another, or that Anglican jurisprudence should be the basis for all personal laws – Hindu, Muslim and tribal). It will involve reconciliation of the different jurisprudences, a basis for which still remains to be worked out. Finally, personal laws of some communities, particularly tribal communities such as the Nagas, Mizos, etc., enjoy constitutional or political sanction. Enactment of UCC would entail constitutional amendments which would not be easy.

Even as UCC has to remain a far cry on these counts, tension areas between the different personal laws and the law as evolved by the Supreme Court in civil matters have been thrown up. For example, to consider an instance on the Muslim side,

the law as laid down by the Supreme Court is that there can be no capricious and arbitrary divorce. Yet Muslim personal law as widely understood and applied so far by the courts contains provision for arbitrary pronouncement of divorce by a Muslim husband (customary law of certain scheduled caste communities in Uttar Pradesh also allows arbitrary divorce). Likewise, the right allowed to a Hindu father to disinherit one heir from share in acquired property which heir in present social conditions would invariably be a daughter, tends towards arbitrariness and would be infirm on grounds of denial of equality.

Against this growing tension between certain provisions of the personal laws of the different communities and the constitutional laws, the argument of the antagonists of UCC that within a democratic framework communities ought to have the right to adhere to their personal laws cannot be pushed too far. While the principle that the democratic framework should allow space for existence of personal laws is unexceptionable, it cannot by the standards of that very democratic logic be allowed to degenerate into a licence for the different communities to deny sections of their members rights to which they are entitled as citizens. In other words, the democratic principle that communities should enjoy space for practising their personal laws has to be subordinated to the internal restriction that the external protection to the personal laws would not be used to dominate the weaker groups within the communities. For, unless consensus exists on such internal restriction, the very idea of autonomous space for communities to follow their personal laws would stand in jeopardy. Any member within the community who feels aggrieved or oppressed would be free to approach the court that his or her fundamental right is being infringed and this cannot be allowed merely because the community is

assured an autonomous space in respect of practising its personal law. We would then return to square one and the state would have little option except to foist an imperfectly articulated UCC.

Enlightened public opinion has recently begun to veer round the view that in the face of enormous difficulties implicit in the enactment of UCC, the appropriate course would be for the communities themselves to undertake to rationalise through entirely internal initiative those aspects of their personal laws which stand in conflict with the constitutional laws or fail to pass the test of equity, justice and good conscience – a doctrine of Roman law followed in India. This course is recommended as it vests the right to rationalise or even to reform their personal laws within the different communities and upholds the principle imperative to a democratic polity that culturally distinct communities possess a degree of autonomy to exist alongside a majority nation.

The fundamental question in the pursuit of this course of action would be how the internal initiative within the different communities should be activated to translate itself into concrete action. Since the orientation to look towards the state for initiating any kind of public action is strong in our country, one course would be for the state to create an institutional framework within which such internal initiative might take effect. For instance, the state could set up a consultative machinery within the different communities to bring about consensus around the rationalisation of the different questionable provisions. Such a course would be wholly counter-productive if not downright self-defeating. It would contradict the principle of autonomous space for cultural communities which rests precisely on the argument that in a polyethnic society the state stands in danger of becoming the carrier of the values of the dominant community. It would also contradict the principle of separation of the sacred and the secular upon which the idea of a secular state is founded. Therefore, quite irrespective of the nobility of intentions, a secular state cannot take upon itself to promote reform within the different communities and were it to do so its intentions would remain eternally suspect.

Under these circumstances, both the initiative for rationalisation and reform as well as the creation of appropriate institutional structures for building consensus over such rationalisation or reform have to come from within the different communities. Since the different cultural communities in India are at varying stages of social development, it is to be expected that the possibility for emergence

of such initiative and for a consensus to be eventually evolved would be varied. Even so a beginning has to be made somewhere and this beginning has to be made by concerned sections in the different communities. These concerned sections would first have to create an institutional structure for rationalisation and/or reform and then go about dialoguing with the different segments of their community to work out a consensus.

There can be no uniform prescription for the process the concerned opinion in the different communities should follow. Allowance for variation in this respect has to be made depending on the advancement level of the communities. For the Muslims with whose problems I happen to be better familiar it appears that two alternative possibilities exist. One course can be for concerned Muslims to begin lobbying for codification of Muslim personal law. The other course can be to work for piecemeal reform and take up on a priority basis those provisions where the contradiction between the constitutional law and the personal law is severe or the law as understood and applied at present is clearly in dissonance with the principles of equity, justice and good conscience.

Undoubtedly codification can go a long way towards removing the existing contradictions between the constitutional and personal laws as well as making them consonant with the principles of equity, justice and social conscience. However there are two catches in this. First, codification led from the top often ends up creating unforeseen difficulties which are subsequently difficult to rectify. Second, codification can only follow emergence of an agreed upon draft code of Muslim personal law. Such an agreed upon code will present the same difficulties as those implicit in the rationalisation and/or reform of specific provisions. Indeed there is every possibility that the difficulties may be greater as the process of codification of their law may be seen by the community as a wholesale change of Muslim personal law against which a strong sentiment already exists. Therefore since social reform is a piecemeal process the appropriate course would be to make a small beginning and work towards an eventual codification of the entire corpus of Muslim personal law.

Concerned Muslims or any group of them of whatever persuasion or bent of mind – progressive, conservative, fundamentalist or modernist – should first begin by identifying those specific areas where tensions between the constitutional and Muslim personal law are already evident. On the basis of general impressions it is possible to suggest that the areas relate to inheritance, marriage and

divorce, but saying this alone would not do. One would be required to take a harder and more detailed look at the whole corpus of Muslim personal law to pin down very narrowly and pointedly the specific provisions which need rationalising.

Once identification of the specific provisions that need rationalising has been made, the second step would consist of finding out the Koranic position on them. Since Muslims argue that their personal law is divinely ordained (which contention for the time being need not be contested), it would help matters greatly if it can be shown to what extent the specific provisions as understood and applied in India are actually at variance with the Koranically ordained position. Such scrutiny would actually strengthen the legitimacy for rationalisation and/or reform.

After both these exercises have been completed an attempt would have to be made to ascertain whether and to what extent the provisions in question as understood and applied in India are responsible for creating hardships for the different sections within the Muslim community. This is necessary in that a great deal of what hardships are alleged to be caused as a result of the provisions as practised at present are based on hearsay and popular beliefs which may not really be entirely true on the ground. For instance it is often alleged that easy divorce renders the plight of Muslim women, especially in the poorer families, extremely difficult. Yet it may turn out on close empirical study that the hardships on this count may not be quite as severe as is often projected. It may be the case that the provision for remarriage existing under Muslim personal law and absence of social stigma to a divorcee actually mitigate considerably the vulnerability of a divorced Muslim woman.

One is not saying that this is indeed the case. In the absence of adequate and sound empirical research on the social aspects of Muslims any such assertion would be extremely erroneous. Nonetheless if one is serious about promoting legal reform from within whatever is suggested by lay opinion would have to be matched with realities on the ground. Provisions which lead to widespread hardships should be addressed first; action on those provisions which do not result in extensive hardships should be postponed until later.

After these preliminary exercises have been gone through a campaign specifically addressed within the community should be mounted to enlist popular support for rationalisation and/or reform in the desired direction. This campaign should have two thrusts. On the one hand it should attempt

to approach the sections which are directly affected by the existing provisions in order to convince them about the necessity of rationalisation and/or reform from their viewpoint and to enlist their support in favour of such initiative. On the other hand, it should try to create a framework for dialogue and debate between the protagonists and antagonists of contemplated rationalisation. Given the hardline position of the large majority of the ulema and leaders of conservative Muslim opinion who find and use the Muslim personal law issue as a means of consolidating the community and whose political interests and source of patronage such rationalisation would threaten substantially, strong opposition and resistance from them against any attempt towards rationalisation and/or reform is to be anticipated. Hence, also the necessity for a dialogue.

As this campaign is under way concerned Muslims as a collectivity or any group among them should set up a committee of Muslim jurists, lawyers, willing ulema, law teachers, social scientists, professionals and members of the middle classes to work out in detail the precise form the rationalised provisions should take. In other words, the precise wording of the provisions should be worked out. The provisions could then be codified. Once such piecemeal codification has been achieved, the groundwork for codification of the entire corpus of Muslim personal law would have been laid.

Russian Elections: No Exit from the Labyrinth

Dev Murarka

The elections to the Russian State Duma, scheduled for December 17, will not mean very much. The Duma is an institution pre-castrated by the constitution. It is powerless to do anything legally or constitutionally against the whims and will of the president. These in-built weaknesses have been made worse by the behaviour of some groups and individual members of the present Duma, who have done their best to discredit the institution.

ON December 17 elections will be held for the Russian State Duma, the legislative body of the country, following the expiry of its first two-year term. The present Duma was elected in December 1993 for a two-year period only, half of its constitutional term, under the shadow of the October 1993 shelling and dismissal of the Supreme Soviet by president Boris Yeltsin. The next one will be for the normal four-year period. The election campaign has been virtually in full swing for several months, though it is in violation of the rules, and the political temperature has steadily climbed. Those contesting the elections are in a state of rising high fever. The people, on the other hand, remain cool, by and large even indifferent. They do not feel that the elections will change anything.

Some doubts still persist if the elections will take place at all. Despite repeated assurances by Yeltsin that the elections to the Duma, and to the presidency in June next year, will be held on schedule, a few observers remain sceptical and fear that under one pretext or another these will be postponed, particularly the presidential one. These fears are exaggerated and the Duma elections will certainly take place. It is another question whether Yeltsin will respect the results and what kind of political map of Russia is likely to emerge from the elections.

The election system is rather complicated and not really conducive either to fully representative or constructive results. The Duma has 450 members. Of these, 225 are elected on the basis of direct territorial simple majority voting, the country being divided into equivalent number of constituencies. With some exceptions, all constituencies have an equal number of voters. These are known as Single Mandate Territories. In order to qualify for the contest each candidate has to submit a list signed by a minimum of 1 per cent of registered voters supporting his candidacy. If less than 25 per cent of the registered votes are cast, the election is considered null and void and re-polling must take place.

The remaining 225 members are elected by a countrywide single constituency, called the Federal Election Territory. Candidates to the Federal constituency can be nominated only by a group or party. No group can nominate more than 270 candidates. However, each group, to be accepted as valid, must submit a list of 2,00,000 signatures of voters supporting it. But no more than 7 per cent of these signatures can be from one territorial constituency, which means that a group must gain support for registration as a contestant in no less than 15 constituencies at least. This is to ensure that a group has a wide range of geographical support. Of course, there is no satisfactory way of verifying such large numbers of signatures and the system is liable to abuse by all sides, including the Central Election Committee, the body in charge of supervising the elections, which can arbitrarily reject a group's application under one pretext or another. Moreover, the committee is appointed by Yeltsin and not everybody is certain of its absolute impartiality.

All the votes cast in the Federal Territory are divided by 225, establishing a coefficient. The number of votes received by each group are then divided by this coefficient to determine how many Duma members a group will be entitled to. If a party list receives less than 5 per cent of the total votes cast in the election, it does not qualify for members in the Duma. Seats thus remaining are distributed proportionately among the winning groups.

At present there are no recognisable political parties in Russia in the proper sense of the term except for the Communist Party of the Russian Federation (CPRF). Opinion polls consistently suggest that it will be the largest group in the new Duma, its rating ranging from 14 to 25 per cent. This impression has become stronger following the recently held local elections in Volgograd where the communists did extremely well on a rather low poll of 40 per cent. In general, a low poll will favour

them while a high poll will reduce their share of votes.

However, although it derives from it, the party should not be taken as a monolithic successor to the old Communist Party of the Soviet Union. It is not the only party which identifies itself as communist. Secondly, even within its ranks the authority of its leader, Gennady Zyuganov, is not unchallenged. As for its ideology, it has moved closer to social democratic concepts with greater emphasis on social justice. Critics, of course, maintain that this is merely the new image projected by the party and its substantive ideology has not changed. The negative and tendentiously selective approach of the party to recent history also keeps alive strong suspicions against it.

Yeltsin recently raised alarm and called for intensive propaganda against the communists. Of course, he understands perfectly well that such diatribes can be only counter-productive. However, the Duma elections are a crucial prelude to the presidential election. It can be taken for granted that Yeltsin will be a candidate and play to win any way he can. So, in reality it will suit Yeltsin, firstly, to have a large number of communists and radical extremists in. This will help him in mobilising all the anti-communist votes in his favour. It also suits him to have as many fragmentary groups as possible so that the Duma remains ineffective compared to the huge presidential-administrative structure, which virtually duplicates and in reality overrides the executive office of the prime minister. In 1993, to create a scare-crow, he had helped Vladimir Zhirinovskiy and his group. Now also a predominantly communist-extremist Duma will ensure continuing western support for Yeltsin.

There are three other groups which are certain to follow close on the heels of the communists. One of them is prime minister Viktor Chernomyrdin-led Nash Dom Rossia (Our Home Russia) or NDR. It is an artificial creation, made on the orders of Yeltsin who conceived the idea of forming two centrist blocs. The other was formed by Ivan Ribkin, the speaker of the present Duma. It has failed to gather much momentum.

The third group included in top rankings is YaBLoko led by Grigory Yavlinsky, a bright young economist and liberal reformer. He is celebrated as the author of the 500 days economic reform programme during the Gorbachov period which was not adopted. The name of the party is a concoction of the surnames of its three founding leaders. One of them has left the group but Vladimir Lukin, a former ambassador to the US and specialist in foreign affairs, remains. The name of the party, which essentially appeals to the intelligent middle class, has caught

**ACHIEVING
EXCELLENCE**

Editor:
 Tarjani Vakil

168 pp	Hardbound	Rs. 300/-
--------	-----------	-----------

Achieving Excellence, encapsulates success stories of six Indian companies, who have taken on challenges, have achieved a measure of success and are indeed continuing forward in their effort to join the world economy. The case studies of entrepreneurship and exports of six Indian companies, spanning a wide spectrum of industries from auto-ancillaries to herbals, and sewing needles to hygiene products, present insights into their growth strategies. The interesting story lines and helpful tips all through this book, would be indispensable reading material amongst students, academicians and leaders of small and medium sized companies wishing to take on the world.

Publishers: Tata McGraw-Hill Publishing Company Ltd., 4/12, Asaf Ali Road, New Delhi 110 002

The book which covers a wide spectrum of industries and provides an insight of case studies of marketing successes based on developing country experience is available and priced at Rs. 300/- each at the address given below:

on because it is the Russian word for apple. Also, it has attracted attention because of its rational and principled opposition to the president and the government.

The fourth in the ranking is the Kongress Russkikh Obshchin (KRO) or the Congress of Russian Communities. Its leader is Yuri Skokov, who has strong connections to the military industrial complex. He is considered by many to be Yeltsin's favourite as a future prime minister. However, it is Alexander Lebed, the deputy leader of the group who is the charismatic figure. He is a former general who opposed the war in Chechnya and was removed. He is enormously popular with the army as well as the public. This fits in with the Russian tradition of going after strong and martyred personalities.

According to some analysts the NDR will come second. Because of Chernomyrdin's close connections to the gas and oil industry, many ironically call NDR as Nash Dom Gasprom or Our Home Gasprom. Of course swings in public opinion or other unexpected events with a bearing on politics may render these estimates wrong by the time balloting takes place. The YaBlok and KRO groups will vie for the third, even second place.

It is difficult to say with certainty which other groups will manage more than 5 per cent of votes. One of them will certainly be the group called Zhenshchiny Rossii or the Women of Russia which is becoming influential. In any case, such groups are not likely to number more than three or four, their votes varying between 10 and 5 per cent. If it is assumed that the three top groups could garner something like 50-60 per cent of total votes cast, of course this does not mean that disqualified groups would have no representation in the Duma. But in this case they will be represented only by those elected from single mandate constituencies with their endorsement. Very often candidates standing from single mandate constituencies are also on group lists. So if a group fails to negotiate the 5 per cent barrier, it has the chance to ensure its representation through the single mandate constituencies. If a group wins more than 5 per cent of votes in the Federal Territory it has the choice of nominating those members who have not won in the single mandate voting.

By midnight on October 23, when the time for presentation of documents to the Central Election Committee expired, 43 groups or parties had succeeded in doing so. Originally 69 groups had notified their intention to register. But the rest of them failed to fulfil all the requirements laid down. Of the 43 groups, some might still be disqualified after further scrutiny.

The prevailing proportional election system certainly vitates against the formation of bigger parties. All those leaders or groups

which believe and strive for power want to achieve it independently and not as part of a bigger entity. After all, the Russian party system is still at a stage of formation and as yet not conducive to stable proportionate representation. Even Russian political figures have come to realise that the system is cumbersome and most likely it will be changed and simplified before the next round of elections to the Duma, most favoured being single constituency direct voting with some safeguards.

In the reality of Russian politics, the elections to the Duma by themselves do not mean much. It is an institution politically pre-castrated by the constitution. Intentionally and structurally so. It is virtually powerless to do anything legally or constitutionally against the whims and will of the president. These in-built debilitating weaknesses have been made worse by the behaviour of some groups and individual members of the Duma who have done their best in this manner to discredit it. Most notorious and destructive of them have turned out to be Vladimir Zhirmovsky, the leader of the Liberal Democratic Party of Russia (LDPR) and a fellow member from his group Valery Marichev. Clowning endlessly, Marichev turns up at the Duma in all kinds of outfits, treating it as a circus venue. In general, the two and their group have conducted themselves in the most brazenly scandalous fashion, even physically attacking other members in the chamber, including women, creating scenes and diversions disrupting the work of the legislature, bringing public ridicule upon it. Besides, there is widespread corruption among its members. Thus, the elections are taking place when the public is greatly disillusioned and dismayed. That it has not become agitational and remains silent only confirms the depth of its feelings, though some hold the view that despite its shortcomings the Duma has served as a safety valve keeping people off the streets.

As Ramazan Abdulatipov, a deputy chairman of the Council of the Federation of the Federal Assembly of Russia (the upper house of parliament) has observed: "Today Russian parliamentarism is not so much the political lever of democratic transformation of political institutions and economic system, as a tragicomic decoration in the absence of democracy."

The people see it all. The lack of Duma's political muscle as well as its less than worthy conduct. No wonder they are displeased and unimpressed with all this and cynical about the usefulness of the institution. Worse still, the opinion is widely held that in qualitative terms the new Duma will be no better than the present one. Because of the dual system of electing the members, all the mischief-makers will be back in the chamber, even

if their present group strength is diminished. This disinclines a large section of the electorate from voting at all.

Some analysts are of the opinion that not more than 50 per cent, at best 60 per cent of the electorate will bother to vote at all. In single mandate territories it might be even below this level. Besides, there is a persistent feeling that voting is unlikely to be very honest, there will be manipulation of voting boxes and even of the counting procedures. The standard of morals in public affairs in Russia today is so low in general that nothing can be or will be done about these abuses. If past experience is anything to go by. Another discreditable aspect of the situation is that some criminal elements, among the candidates on party lists and on their own in single mandate territories.

Even before the elections have taken place, reports of malpractice from all sides have come in. It begins with the collection of signatures. According to an *Izvestia* (October 18, 1995) report, these signatures were being bought freely, the price of a single signature ranging from the equivalent of one dollar to five dollars. In the recent elections for the post of the governor in Ekaterinburg (former Sverdlovsk) about one and a half dollars was paid for each signature. In some places wheat flour or vodka was distributed, the level of pauperisation being such.

This is not all. Other sorts of abuses have been practised elsewhere. For instance, details of households were bought from organisations having them. And every area has many such organisations who look after houses and buildings. The names in their records were signed on the list of signatures for this or that candidate. There are no effective means of checking these signatures or of the methods used to obtain them. For each such group details 4-5 thousand dollars was the asking price. Besides up to 20 per cent of signatures were affixed by the groups and parties themselves even before they went out collecting other signatures. Only limitation of funds keeps the maximum price level down to 3-5 dollars for such signatures. For instance, it appears that NDR, which has run the most extensive campaign of all, has paid only the equivalent of about 20 cents.

Also for sale are places on the list of candidates. To be on the list of the more promising parties a candidate may have to pay \$ 2,00,000. Being on the list of a less powerful party may be somewhat cheaper. It is also estimated that election campaign expenses in a single mandate constituency may be up to \$ 3,00,000.

A striking feature of the present election campaign is the absence of any serious programmatic discussion. Every group, even the most right wing one, promises reforms, though it interprets the concept in its own

idiosyncratic way. They mean different things when swearing by reforms. The dominating, if not the obvious, issue of the elections is the nature of the state: of what sort it should be and what role it should play. This is an unavoidable fundamental issue in the wake of the not so distant trauma of the collapse of the Soviet state which still touches mass consciousness.

Roughly speaking, four basic approaches characterise all thinking. The first two approaches have at their centre the idea of restoration, though of different kinds and of varying shades. In the first place are those imbued with the spirit of the restoration of the pre-communist past. They want a return, if not to all the past institutional forms, then at least to its spirit of national and imperial glory, akin to the spirit of romantic nationalism, increasingly touched by slavie and the Orthodox Church philosophy.

The second approach favours restoration of the communist past. But only a few want it back in its full panoply. Many of the older generation want it back in a modified form with emphasis on state guaranteed welfare. This argument mostly appeals to those impoverished by reforms and those who believe in a strong centralised state. Their attitude also incorporates some elements of nationalism but by and large their concern is with materialist aspects of relations between the state and society.

The third approach is that of radical-extremists, no matter by what name they call themselves. Some like Zhirnovsky, even attach a liberal, democratic tag to themselves. These elements also play with a more aggressively racist slavie tag. In the present-day context their concept is closer to a totalitarian state than that of the communists and some of them are openly fascist.

Lastly, there is the vast, amorphous spread of thinking which perceives Russia as a modern, democratic, liberal but powerful state. It covers most of the political groups which are not included in the forementioned categories, and to a moderate extent might even include some of them. Where they differ is in their concept of a modern state and even more strongly on economic policies to be followed. And apart from the communists it is the groups in this category which are centrally predominant in politics. It includes the NDR, YaBLoko, Yegor Gaidar's Demokratcheskii Vihor Rossii (the Democratic Choice of Russia) or DVR, and others. They are not particularly concerned with religion or slavie nationalism though the more establishment-minded of them are inclined to toy with them.

Underlying this question of the kind of state people want to see are problems of everyday life, of law and order, of social justice, of growing levels of poverty, and

so on. They want a state which can successfully deal with them. However, no party or group has any really concrete proposals for overcoming these problems.

One of the consequences of this preoccupation with a powerful state at the heart of mounting election fever has been the worsening of relations, at least temporarily, between Moscow and Washington. As the accusations of a sell-out to the west by Yeltsin and his foreign minister Andrei Kozyrev, not only by the radical nationalist and chauvinist elements but even some of the liberals, have mounted, Yeltsin has adopted a shrill, strident tone of asserting Russian greatness and parity as a superpower.

A particular issue has been made of the Yugoslav situation. Imagining that a pro-slav position will simultaneously please a section of the Russian public, blunt the thrust of the domestic opposition and put recognisable distance between Russia and America, Yeltsin began to make a great show of supporting the Serbs and condemned what he termed the pro-Bosnian position of Washington and NATO. The NATO bombing of the Bosnian Serb military positions in September-October provided an obvious pretext for Yeltsin's histrionic hysterics in public on the matter.

Unfortunately, it turned out that the Russian position was more pro-Serb than that of the Serbs themselves and devoid either of subtlety or realism. Yeltsin and his advisors failed to recognise that the bombing was a consequence of prolonged obduracy on the part of the Serbs and tactical in intention, aimed at making them agree to a compromise and peace in Bosnia. By and large this proved to be so. The Serbs relented under pressure.

While continuing to protest against the western approach, in the end Russia had to accept the new reality created by the American determination and pressure to put an end, at least for the time being, to the interminable conflict in former Yugoslavia.

As if to draw attention to its wrong-footed approach to the bombing of Bosnian Serb military positions, the question of command of new Russian and NATO troops to be stationed in Bosnia as part of the new peace deal has made into a bone of contention. Russia wants joint command by rotation to which the NATO seems unable to agree. At the time of writing, the issue still remains unresolved.

There is, of course, the more important issue of the extension of NATO membership to some of the east European states to which Russia, not without reason, objects.

However, whatever its effect on the Duma and later the presidential election, with such antics all that the Russian leader has succeeded in doing is to reawaken distrust of Russia in the west, particularly among the former Warsaw Pact members some of whom

have increased their pressure for joining the NATO. As for Russia's status in the world a veteran Russian observer, Stanislav Kondrashov, has pointed out, "Mystifying millions of Russians by its superpower gestures, the Kremlin plays upon their still surviving superpower consciousness and thus puts brakes on their acceptance of the new changed status of Russia in the world arena" (*Izvestia*, October 13, 1995).

This lack of real status was underlined by foreign minister Kozyrev himself, who wistfully pointed out in a television interview that the American representative to the peace initiative, Richard Holbrooke, was everywhere accompanied by two plane loads of assistants and advisors, including a cartographer and up-to-date communication facilities. In contrast, Russian representatives in twos or threes, had to travel by scheduled flights. Curiously enough, this financially unsustainable role of Russia as a 'great power' was hinted at by Yeltsin himself at a press conference on October 19, 1995 when he intimated that the cost of maintaining Russian troops for peace-keeping amounted to three billion dollars annually, which was too much for Russia. It almost seems that Russia wants to maintain its superpower status on the strength of monetary support by others.

This did not prevent Yeltsin from publicly humiliating his foreign minister by undertaking at a press gathering to sack him as soon as a suitable replacement could be found. True, he changed his mind the next day. However, it provided a fascinating glimpse into the prevailing feudal quality of personal-political relationships when swallowing all the denigration heaped upon him by the president, a smiling Kozyrev turned up at the air port to join the 'vozhd' (the supreme leader) on official visits to France and the US.

Whatever the election results, in the light of all the difficult domestic and foreign policy problems which are becoming grave by the day, the new Duma and the president will have to learn to reconcile themselves to realities and attempt to bring some order to the house of Russia. It is more than an open question whether they will prove capable of doing so, given Yeltsin's penchant for keeping all power in his own hands, and a powerless Duma determined to demonstrate that it possesses some semblance of authority. It may once again turn into a dialogue of deaf and unequal branches of power, without an exit from the foggy labyrinth. This will increase the risk of some new political crisis flaring up in the period between the Duma election this December and the presidential election next June. The conflict, most likely will centre on the question of presidential election, though the latest bout of illness has weakened Yeltsin's position.

On Contempt, Contemners and Courts

Vinod Vyasulu

For a society to grow and develop it is essential to build suitable institutions. The success of the east Asian 'tigers' is largely attributable to their ability to foster such institutions. On the other hand, this country's record in creating and nurturing institutions has been very poor. The issues raised by the recent order of the Supreme Court holding a principal secretary to the government of Karnataka guilty of contempt are a reflection of this general institutional decline and decay.

THE recent order of the Supreme Court holding the principal secretary, housing and urban development of the government of Karnataka guilty of committing contempt of court by wilfully not implementing its order in a service matter has opened up a Pandora's box of issues.¹ There have been many articles in the press, but most of them have either applauded the court for its firm action, utilised the opportunity to criticise the bureaucracy for which there is surprisingly little goodwill, or sympathised with the concerned official for the plight he unwittingly found himself in.² Everybody has been busy expressing an opinion: the opposition parties have got together to demand the resignation of the government. The assembly has been in turmoil over this issue. Comparisons are being made with the symbolic punishment meted out by the court to the former chief minister of Uttar Pradesh, Kalyan Singh, for his role in the Babri masjid affair. It is a regrettable fact that in much of the discussion, many have cast doubts on the wisdom of the court,³ especially in terms of the severity of the sentence. For the smooth functioning of Indian democracy, this is a dangerous sign. The Supreme Court must not be questioned.⁴ In fact, this judgment should be seen as an opportunity to re-examine our system⁵ and improve upon it, not to cry over spilt milk.

This order must be seen as a contribution by the Supreme Court towards a betterment of our administrative systems by means of a timely warning,⁶ and not as an intrusion into the realm of the executive.

The unusually firm decision of the court has thrown the IAS officers, particularly in Karnataka,⁷ into confusion.⁸ Many, particularly the more honest and sincere ones, are now petrified of working in accordance with the established practices which they feel should have protected their senior colleague, but have not.⁹ There is

a sense of outrage that an honest and respected officer has been thus punished,¹⁰ when others, at high levels, who are suspected to be corrupt go scot-free.¹¹ They admit that the existing practices do not often function well in service matters, and that the engineer who filed these cases may have had a genuine grievance; but argue that the fault did not lie with the officer who has been punished by the courts.¹² There has been failure at many levels. There is also anguish at the fact that the political masters, who effectively wield power, are nowhere in the picture.¹³ All this cannot but be detrimental to the functioning of the administration in the state: hence the need for careful reflection and necessary action without undue delay.

This article does not pretend to be such a reflection, which anyway must come from those who are directly involved in these issues. It is an effort to raise questions that may contribute to a deeper understanding of what is at work here. Thus, from the beginning it must be noted that this is a very limited exercise; and that it is not the intention to apportion blame or to defend any point of view in this contentious matter. But can we learn anything from this event? Can the general public contribute to a process of betterment of systems? If so, how? If this event reveals something of the typical way in which government functions, then it is fair to say that useful lessons can be learned from this experience. Perhaps such questions can contribute a perspective that insiders sometimes lack, but need. It can bring in inputs from the public that government usually does without.

DILEMMA IN RETROSPECT

A perusal of events, to the extent it is possible from the outside,¹⁴ and with the benefit of hindsight, suggests that the

principal secretary of the department of housing and urban development was caught between the devil and the deep sea. He had before him an order from a division bench of the high court that had to be implemented; and there was also then an order from the Supreme Court that was not absolutely clear in what it ordered; and there was a contempt of court petition against him in the Supreme Court. The relevant passage from the Supreme Court order of July 26, 1993 is as follows:

It is clarified that this court does not intend to upset the rights given to the applicant Dhananjaya by virtue of the order passed by this court in the above appeal. He will be entitled to all the benefits flowing from those orders. Under these orders whatever rights have been accrued to the applicant Dhananjaya he is entitled to all the benefits and to effectuate the said rights, if it is necessary, it may be open to the corporation to create supernumerary post for the period in question and give the benefits to the applicant for which he is entitled as per the judgment of the division bench. The state government is directed to issue necessary orders in this behalf.

The key question here is what the rights of Dhananjaya were that were to be protected. Only if necessary was a post of chief engineer to be created: the court used the word 'may', not 'shall'.¹⁵ In its order dated March 31, 1994, the high court had rejected the rights as claimed by Dhananjaya, and in issuing this order the division bench took note of the Supreme Court order of July 27, 1993. On this basis, the government of Karnataka issued an order on July 10, 1995; and it was on the basis of this order that the principal secretary has been found to be guilty of contempt. But until the high court orders were set aside, creation of a supernumerary post may not have been consistent with the spirit of the high court order. It could be argued that the order issued, based on the high court interpretation of the Supreme Court order, did not violate the Supreme Court order because it only said that the corporation "may...create" such a post if needed. When it was found on the basis of the high court judgment that it was not required, creating it would have been wrong indeed.¹⁶

Dhananjaya filed a special leave petition against the high court order in the Supreme Court, but withdrew it on February 28, 1995. But he continued with the contempt proceedings on the ground that the order of July 26, 1993 was not complied with.

The key was in what the entitlements of the engineer concerned were, and in the

complex operation of government bodies, this had to be carefully determined. The principal secretary presumably had no wish to antagonise any court, in the event, he fell foul of the Supreme Court because the reasoning given was not accepted by the court,¹⁷ because of the assurance given to the Supreme Court on May 10, 1995 by the counsel for the state government seeking time [which was granted] for the implementation of the Supreme Court order. What exactly was to be implemented seemed to be clear: benefits as flowing from the high court order, which took into account the Supreme Court order, especially after the affidavit of the chief secretary. The point here is that, in whatever he did, the principal secretary went strictly by legal advice and not by any personal whim in the situation as it prevailed.¹⁸ What is to be done in such a situation is a question that faces any official. And it requires a clear-cut answer.

Article 21 states that no one shall be deprived of his liberty save according to procedure established by law. In this particular case, it has been argued that this has been overlooked.¹⁹ What protection does the system offer for decisions taken in good faith?²⁰ Of course, if the decision were mala fide, punishment is called for. The issue comes up here because everyone, including the chief minister and the leaders of the opposition, are agreed that there was no mala fide involved.

ON SERVICE MATTERS

The issue began about 20 years ago with a case filed by an engineer in the service of the Bangalore City Corporation. There were different courts involved; there were different judgments at different points of time; there was legislation with retrospective effect; there were appeals in the Supreme Court; there were special leave petitions that were filed and withdrawn. There were a number of contempt of court proceedings. It has been noted that the engineer concerned belonged to the scheduled caste, and this has made the issue politically delicate.²¹ The last was the order of the Supreme Court of August 22 finding the principal secretary guilty of contempt.²² On September 12, the principal secretary surrendered to the police commissioner of Bangalore and was lodged in the central jail to serve his sentence.

Those in government service have learned to live with inevitable delays. They have learned with bitter experience that the system no longer seems to work at the level of departmental appeals. Not many years ago, an appeal to the head of the organisation, more often than not, resulted in the dispute being settled. But today, for any number of reasons, discretion is rarely used, and

assessments rarely made. In our large offices, rules are mechanically followed by the petty bureaucracy that deals with the files: sometimes the correct and relevant rules are not referred to, but once something is on record, no one dares point out an error, let alone overrule a lower level official. There is little of what the courts have called 'application of the mind' in many offices.

Today an appeal is seen only as a necessary part of the procedures to be followed before approaching the courts. No one seems to expect that the appellate process will resolve the issue. For many who go to the courts, it is not a judgment, but a stay order that is important.²³ Everyone knows that these things take years to settle. Officials know that even if they win, the government will routinely appeal to the higher courts and so the process is endless and expensive. This has had a pernicious effect on morale in most government organisations, and on all organisations that get funds from government at any level. It is here that the tragedy of the public begins: the way bank officers hold the public to ransom on service matters is only one instance of this syndrome.

Thus the case filed by this engineer was treated in a routine but normal manner. Whatever the merits of this case, the basic problem is one of an inflexible and rigid system that cannot respond in time to grievances. Why cannot we simplify these systems? Why cannot the Bangalore City Corporation be free to create posts as it deems fit, subject to its own resources?²⁴ The buck must stop at a suitable level in the organisation: 'reference to government' must stop. This is clearly a political matter, and one that is likely to be resisted by both civil servants and politicians as neither would like to give up power it has grown accustomed to wielding. The administrative system has far too much of centralisation; even when some delegation is done, the routine is to refer to government. Unless this rigid system is dismantled, such cases will continue to crop up, and officers will continue to face such problems at different levels. This complexity was important in the current case in Karnataka involving the Bangalore City Corporation, in which the Corporation did not have the requisite powers. It is difficult to pinpoint an individual as being responsible when the normal rules of business are being followed. Therefore it is essential to focus attention on administrative reform: on simplification of systems, on autonomy to organisations, on encouraging an application of the mind, and so on. Unfortunately, there seems to be little thought or effort in this direction even after this incident.

Again, one must examine whether the current system, in which service matters reach the courts under Articles 32 and 226,

and the kind of protection that is offered under Article 311, need an reinterpretation.²⁵ Case law over the years has generally established that it is the employee who is right.²⁶ In the resultant environment, those who are sincere find it difficult to work. The result is demoralisation in the service. There are faults on both sides in this process. Can the whole system be made manageable? If not, should it not be dismantled and replaced by a more flexible one?

Thus, unless there is a radical restructuring of the services, not in terms of rules, but in terms of how the system works, such incidents will keep recurring.

OF LEGAL ADVICE

In the current case, the principal secretary, who has been found guilty of contempt acted on the advice of government lawyers. The order that has been found deficient by the Supreme Court bench was drafted on such legal advice; the assurances that were given to the Supreme Court were given by government advocates on the basis of their reading of the law and the facts of the case. The official went strictly by advice from competent bodies in a situation in which the legal orders of the Supreme Court were not very clear. Was the commitment given to the Supreme Court by the counsel for Karnataka in accordance with the administrative realities that the principal secretary had to work with? This is important as it was on the basis of this assurance that the Supreme Court has acted.

The aggrieved engineer had in fact filed a special leave petition in the Supreme Court against a judgment of the high court that found him ineligible for certain benefits and then withdrawn²⁷ it to file a contempt of court proceeding.²⁸ Why was this done? Was the advice given to the principal secretary sound? Was only the principal secretary responsible, or also the chief secretary, who had also filed a similar affidavit in the court? If not, why? Does he have any remedy?

Cannot the advocates who gave such poor advice also be deemed to have committed contempt of court? Just as there is now a system of medical malpractice, has not the time come to go into the question of legal malpractice, if indeed there was any? This is not to say that the lawyers concerned were guilty or deficient in any sense,²⁹ but when their advice has landed an official who has no personal interest in the case in jail, do they not share at least some of the responsibility? What compensation is the aggrieved official, who has had to spend a month in jail, entitled to if he is indeed a victim of events and circumstances? And who can provide it?

Is it desirable that the Supreme Court hears appeals in which no substantive question of law is involved? In all countries, the highest court in the land concerns itself with issues of law and its interpretation. But the Supreme Court in India has over the years, particularly in service matters, become a court of appeal under the writ jurisdiction. Were there any issues of law involved here? Were there any issues of Fundamental Rights?³⁰ What are they? What is the role of the Supreme Court here: to ensure that the high court decision is implemented, or to give a fresh decision?

This provision for writ jurisdiction was included in the Constitution to provide a check against the abuse of power by the state and to protect fundamental rights. In what sense are service matters relating to promotion a protection of fundamental rights? How does the right of equality guaranteed in Article 14 come into the picture?³¹ So far as I understand, promotion is not a fundamental right, and if there are grievances in any organisation, then they should be dealt with at a lower level of the judiciary in accordance with the law of the land. This is how the private sector functions; and this is how, I submit, the public sector should. Even if it is felt that special security of service should be given to a certain section of the bureaucracy, does the Bangalore City Corporation come under that category of institutions? Why?³² And do service disputes here have to be resolved by the Supreme Court on merit, rather than on basic questions of law? Are the lower level courts so deficient in dispensing justice? If they are, then is not the basic issue one of making them work properly?

One has also to recognise the unfortunate fact that the faith in the courts and the judiciary is not absolute today, as it should be. The courts themselves have recognised this recently, and set up a system to deal with erring judges. Earlier, the controversies around justice V Ramaswamy (against whom impeachment proceedings were actually initiated, and which fell through because of large-scale abstentions by members of the ruling party) and chief justice A K Bhattacharya of the Bombay High Court had done little to enhance the image of the judiciary.

A respected foreign scholar³³ has this say about our judicial system:

The proceedings are extraordinarily dilatory and comparatively expensive; a single issue is often fragmented into a multitude of court actions; execution of judgments is haphazard; the lawyers frequently seem both incompetent and unethical; false witness is commonplace; and the probity of judges is habitually

suspect. Above all, the courts are unable to bring about a settlement of the disputes that give rise to litigation.

This, if true, is a deplorable situation. Perhaps the court has chosen this occasion to cut the Gordian knot. What are the consequences of this for all of us?

ON PUBLIC PERCEPTIONS

What came out clearly from the media reports and letters to the editor in many papers was a deep hostility to the bureaucracy, especially to the IAS as a cadre. They have been portrayed as uncaring mandarins who have finally got what was coming to them. Many expressed the view that the principal secretary was indeed guilty of disobeying the Supreme Court, and that he had been appropriately punished. There was great amusement at the picture of 'IAS officers on dharna', and a feeling that at long last they have got a taste of what the public gets all the time. Why is this so? The IAS has to ask itself this question.

That the bureaucracy has lost all touch with the public is a basic truth. The corruption that one meets with in daily life, the bribes to officials to get work done, the collusion between officials and politicians wherever any regulation is involved, is a daily reality that members of the public face.³⁴ Whether it comes to 'buying' a driving licence, or to paying 'office expenses' to register as an organisation that has to pay Profession Tax, or to providing an incentive to get some legitimate work done, this daily irritant is enough to make any one called a government official a hated figure.

And since IAS officers are perceived as the head of this bureaucracy, the hate rubs off on them as well. It is further aggravated by their aloofness from the other services, from the perception that they grab posts from other services,³⁵ and so on.³⁶ Even in the current situation, when the contempt proceeding put all officials in a spot, and they could have found allies in the IPS, the IRS and so on, it was largely treated as an IAS matter. And when finally an appeal was made to other services to show solidarity with the aggrieved officer, he was seen as an IAS officer and not a government servant who was in trouble.³⁷ The IAS officers have also not helped the situation by demanding from the Fifth Pay Commission that they be given 30 per cent more than other services.

ON REMEDIES

The chief minister of Karnataka has made great efforts to set the situation right from its own point of view, which sees the principal secretary as unjustly victimised.³⁸ This included an appeal to the Supreme Court to

show mercy, which was rejected by the court on the grounds that the government of Karnataka was a third party with no interest in the case. The appeal of the principal secretary, apologising humbly and seeking mercy was also turned down. One of the judges asked the lawyer to mention who had responsibility, as then that person would be issued a notice. When this was not answered, the petition was dismissed. The government of Karnataka has also moved a request for a Presidential Pardon under Article 72 of the Constitution. This is pending;³⁹ in the meantime the officer has served out his sentence.

What is surprising at first glance is that no appeal was made to the governor of Karnataka under Article 161 of the Constitution to commute or reduce the sentence imposed on the officer. This would not have offended the orders of the Supreme Court, because the governor also has such inherent powers that stem directly from the Constitution; it would have established the fact that the state government accepted that a failure of the system had taken place for which it was responsible, and it would have led to the officer getting a reprieve that all seem to believe is his due.

Another reason for the pardon being given relates to the severity of the sentence. This is not the first time that a government official is being hauled up for contempt of court.⁴⁰ But it is the first time that the court has awarded such a harsh sentence.⁴¹ While this may have the salutary effect of making officials more circumspect, one is left to wonder why, in this case such punishment has been meted out. What are the factors that weighed with the court? Was the interference of a fellow IAS officer the cause? If so the court has also punished him by having its reprimand included in his personal file. Was there reason for such severe punishment on this particular principal secretary?

In this situation, if a petition was made by the chief minister, it would have been open to the governor to think about it, and if deemed fit, to issue a pardon exercising his own independent powers. This option was not exercised. One wonders why this option was not chosen.

One reason that has been advanced is that powers of pardon of both the president and the governor (under Articles 72 and 161) are limited in that they relate to offenses committed under any law relating to a matter to which the executive power of the union or the state respectively extend. And here the Supreme Court has not acted under the Contempt of Court Act, but invoked its *sui generis* powers inherent under Article 129 of the Constitution as a court of record. And since no law was violated, the question of pardon does not arise.

If so, in seeking presidential pardon for the jailed officer, the government of Karnataka has been poorly advised. This is an example of the way the whole case has been conducted: the system has indeed failed, and the orders of the Supreme Court have brought it out into the public for possible remedy. This is really the last opportunity for reform, and for presenting it starkly before us we should be grateful to the Supreme Court.

BY WAY OF CONCLUSION

The point has been made by many that it is essential for a society to build suitable institutions to enable it to grow and develop. The success of the East Asian Tigers is largely attributed to their ability to foster such institutions.

While India has many strengths, from its vigorous democracy to its long traditions and rich resources, India as a country has been very poor in creating and nurturing institutions. Such institutions as existed suffered major blows in the 1970s, after the deaths of Nehru⁴² and Shastri, in the hands of their successors.⁴³ This decline in institutions is evident in all spheres of life. Neither the bureaucracy, nor the judiciary, nor even the universities and others, have escaped this general fate. Administration has become the routine and mindless application of irrelevant rules in decaying organisations. This poor foundation of institutional functioning is a major weakness that the reform process under way must seriously address.

This is a matter that has implications for the new economic policy. While deregulation is needed and is to be welcomed, what the reforms require is not just less government interference, or even less government, but more of effective institutional regulation on the basis of clear guidelines that are uniformly implemented. The Supreme Court has again raised this issue by stressing the importance of a public regulator for the use of airwaves for TV, in which the government is only one interested party.⁴⁴ The proposed Telecom Regulatory Authority of India is another case in point. There will have to be many more. But these institutions have to function impartially and effectively, if the economy is to move ahead as hoped. Therefore, institutional development is one of the most important priorities today. The decline of the last few decades has to be reversed: and the lessons learned from this episode must be built into the design of these bodies. It is clearly a challenging task. It is instructive that the need for it emerges from an introspection brought on by a contempt case.

The issues we have been discussing, and the incident that gave rise to this discussion, are a symptom of this general institutional

decline. In this situation, a tit for tat attitude will only make things worse. An eye for an eye will only make the whole world blind.

What is required is a great deal of restraint and circumspection on the part of all who are concerned with the nation's development; this is a necessary, but by no means sufficient condition, for us to progress and build. The Supreme Court itself has recognised the need for restraint in invoking its powers of punishing for contempt.⁴⁵ A great deal of tolerance is needed. Several other things, not discussed here will have to be taken care of at the same time. Whether we can rise above petty issues that will dominate us in the guise of major principles, is something that remains to be seen. We have no Mahatma Gandhi today to show the way. Each of us has to be a little Mahatma; and I am afraid, most of us are not up to this task.

Notes

[The comments of N R Madhava Menon on an earlier draft are gratefully acknowledged. Needless to say, he cannot be held responsible for the views expressed.]

- 1 The events have been well documented in notes circulating among the IAS officers of Karnataka. Some of the issues have been brought up in them.

- 2 For an intelligent exception, see Renuka Vishwanathan's articles, 'Court of No Appeal' in *The Sunday Herald*, October 2, 1995, in which she discusses the appeal process in the context of the contempt law in the Supreme Court.

- 3 See for example the write up in *India Today*, October 15, 1995; also the article by B K Chandrasekhar and K Ishwar Bhat in *The Times of India*, Bangalore, October 14, 1994.

- 4 On this basis, the former chief secretary of Karnataka, T R Satish Chandran, a highly respected individual, has suggested that all departments in future have legal cells to follow up on court orders. This is, I understand, the normal practice in the income tax and audit departments.

- 5 The article by the former judge of the Supreme Court, H R Khanna, on judicial activism, in *The Hindu*, September 27 and 28, 1995, are illuminating. He touches also on the question of contempt in this article.

- 6 See the erudite article by N R Madhava Menon, 'Constitutional Balance Between the Executive and the Judiciary and the Exercise of Contempt Power', *National Law School of India*, October 1995

- 7 The IAS Officers' Association has not been able to define a common view on the ongoing events; while the officers share a sense of both fear and outrage, the association has shown a singular lack of leadership.

- 8 Around the same time, there were reports in the press of IAS officers in Kerala and Tamil

M.PHIL ENTRANCE TEST (MET 1996)

For M.Phil 1½ year programme in Humanities and Social Sciences with Specialization in Planning and Development, I.I.T., Powai, Bombay 400 076.

Eligibility : Master's Degree in Arts, Commerce (55% marks), and M.Sc./B.Tech (60% marks with adequate background in Social Sciences). Those appearing for the above exams may also apply.

Application : For Brochure cum Application Form, send **Crossed Demand Draft for Rs. 400/- (Rs. 200/- for SC/ST) drawn in favour of Indian Institute of Technology, Bombay** payable at Bombay with self-addressed envelope (11" x 5") stamped Rs. 4/-

Exam. Date : Saturday, May 11, 1996

Venue : IIT Bombay, IIT Delhi, IIM Calcutta.

Issues of Forms : 2nd January to 30th Jan. 1996

Last Date for receiving applications : 28th Feb. 1996.

- Nadu also being hauled up for contempt of court. Officers of other services, especially the IPS, were hauled up in UP. The Karnataka episode does not seem to be unique: this is clearly a sign of the times.
- 9 The press has been full of reports about the differences among members in the association in its meetings on this affair. It is reported that the secretary has resigned; it is also reported that some have resigned from the membership of the association itself, so fundamental are the disagreements over this issue.
 - 10 In an unprecedented move, around 70 IAS officers in Karnataka, in their individual capacities, sat near the Gandhi statue in Bangalore on Sunday, September 24, 1995, to express their solidarity with the jailed officer
 - 1 A senior officer, V Balu, has openly expressed these views in a meeting organised by the Press Club in Bangalore on September 24
 - 2 This is matter of some controversy, even among legal scholars. See for example the contrasting views of Chandrasekhar and Bhat, *op cit*, on the one hand, and Madhava Menon, *op cit*, on the other, on this specific issue.
 - 3 There is however, a certain amount of respect for the chief minister for the efforts he has made on behalf of the unfortunate official. It must be noted, though, that after the assembly met, the chief minister gave a speech which gave the impression that he was washing his hands of the whole affair. One can only guess at the pressures that he is under.
 - 4 I have drawn on the summary of events referred to above, and on newspaper reports over the issue as the drama unfolded; and several informal papers drafted by various persons in a position to know what was going on. The caste factor has been highlighted in the newspaper reports.
 - 5 It may be noted that the creation of a post of chief engineer entails many things. Apart from the salary and perks of the chief engineer, a whole paraphernalia has to be brought into existence: posts at lower levels, division of work and so on. These are executive responsibilities that stem from an order to create a post. They involve financial commitments, and the government is in the throes of a fiscal crisis. As tax payers, there is concern over the growth of the government bureaucracy. These are dimensions of a judicial order that must not be forgotten.
 - 6 This was the substance of the affidavit filed by the then chief secretary to the government of Karnataka, J C Lynn. A case of contempt had been filed against him also; but it had been dropped after his affidavit. The principal secretary's argument was the same, his affidavit was similar in content.
 - 7 The Supreme Court recorded that it does not attribute any mala fide to the officer, in its order finding him guilty of wilful disobedience.
 - 8 A legal luminary like Madhava Menon does not agree with this view; see his article referred to above. Yet, many have been arguing that implementing the high court order was the right thing to do in this situation. The dilemma of a serving official is clear, when even experts disagree. In the event, the official went by the advice of a senior counsel, Santosh Hegde.
 - 19 B K Chandrasekhar and K Ishwar Bhat, 'The Vasudevan Case: Interpreting an Ambivalent Ruling', *The Times of India*, Bangalore, October 14, 1995
 - 20 This of course has to be conveyed to the court, and the court has to be convinced. But who gets the benefit of the doubt when there is some ambiguity?
 - 21 It is unfortunate but true that a communal/caste dimension has been given to the case, with the official concerned being a brahmin and one of the judges on the bench being a dalit himself. There is also the complication of another IAS officer having tried to 'influence' the court by meeting one of the judges. While caste is a reality in this country, bringing it up in this type of context tends to cloud the issue and make normal administration difficult.
 - 22 There have been developments since: the Supreme Court held that the government of Karnataka did not have the *locus standi* to intervene on behalf of the official. And the official has served out his sentence in the Bangalore central jail as a civil prisoner.
 - 23 It must be noted in passing, with sadness, that this is true even of the so-called superior services like the IAS and the IPS who have had recourse to the courts. In Karnataka, two chief secretaries have been suspended. The rot has set in at the highest levels as well. The IAS Officers' Association of UP has demanded that the power delegated to the state by the union, of suspending officers of the all India services, must be withdrawn. This will have many serious implications, such as centralisation through the backdoor, that need now to be considered.
 - 24 At the centre, the rot started in the 1970s, when Indira Gandhi began to centralise powers, and her successors have continued with the system. For example, the appointments subcommittee of the cabinet must 'vet' all appointments of above a certain level in all government organisations, from the public sector companies to the IITs and IIMs. Why is this necessary?
 - 25 Whatever the protection under Article 311, now the court has shown that officials have no protection when it comes to the contempt provisions, which are the inherent powers of the courts under the Constitution. It must be noted that the legislature too has such powers, and that these have been exercised by some legislatures in recent years. Nothing stops them from hauling up officials, who may then get caught in the crossfire of contempt proceedings by different authorities.
 - 26 For the not unreasonable reason that often government managements have indeed behaved in a high-handed and arbitrary manner. The lack of accountability in the system so long as rules are mindlessly followed has led to this.
 - 27 A puzzle that remains to be explained.
 - 28 I understand that, at the moment, there are around 3,000 contempt cases pending in the Karnataka High Court, which has devoted Mondays only to these hearings. Why are there so many of these cases? I wonder how many are pending before the other high courts and the Supreme Court itself.
 - 29 I would like to refer here to the erudite discussion in NR Madhava Menon, 'Law and Ethics', B V Narayana Reddy Memorial Lecture, Indian Institute of World Culture, Bangalore for such a plea from a legal luminary.
 - 30 Many judgments of the Supreme Court have in the past led to constitutional amendments. Therefore, it is desirable, in the present case, to examine this aspect as well, as it may lead to helpful changes in the larger interest.
 - 31 Of course, if this is concerned, then clearly it must be defended, if needed all the way to the Supreme Court.
 - 32 I would like to refer to the erudite discussion of the Article 12 question in Ramaswamy R Iyer, *A Grammar of the Public Sector*. Rawat, Jaipur, 1990.
 - 33 Oliver Mendelsohn, 'The Pathology of the Indian Legal System', *Modern Asian Studies*, Vol 15, 1981.
 - 34 I have discussed these problems in articles in the *Indian Express* and *The Hindu*.
 - 35 For example, the post of comptroller and auditor general has been given to IAS officers; look also at the Election Commission, or many public sector enterprises, universities, research institutes, etc. to see the basic truth here.
 - 36 The Indian Revenue Service officers are up in arms about the fact that an IAS officer is the member-secretary of the Fifth Pay Commission, and are planning to go to court to seek his removal from this post as they do not believe he will be objective in his work in the commission.
 - 37 In this specific case, there was widespread support from officers in many of the other services.
 - 38 One wonders whether the chief minister met the chief justice in this connection, and if so, whether this is correct. If not, would it also qualify as interfering with the course of justice, as the intervention of Swatantra Rao was seen by the court?
 - 39 It is being rumoured that the government of India finds it not possible to make a positive recommendation to the president. If this is so, it raises another question, why does the president have to go by the recommendation of the GOI in this matter? Does this come under the limitations imposed on the president by Article 74? On what matters can the president act on his own?
 - 40 Secretaries to the government of India and chief secretaries to the state government have in the past been in the dock, and their apologies have been accepted by the Supreme Court.
 - 41 And after it, in the case of officers from Kerala and Tamil Nadu, the court has been much more lenient.
 - 42 It can be argued that it began in Nehru's time. It was he who introduced the Ninth Schedule into the Constitution, it was he who began the misuse of Article 356 by dismissing the Kerala government headed by E M S Namboodiripad, and so on.
 - 43 Even the Supreme Court was not spared, as the Emergency experience of supersession of senior judges in the appointment of the chief justice shows.
 - 44 Secretary, Ministry of Information and Broadcasting vs Cricket Club of Bengal, 1994.
 - 45 This has been pointed out at great length by Menon, *op cit*.

SECURITIES TRADING CORPORATION OF INDIA LIMITED

Regd. Office

Statement of Shri D. Basu, Chairman of the Board of Directors of Securities Trading Corporation of India Limited at the First Annual General Meeting of the Company held at Bombay on October 30, 1995.

I have great pleasure in welcoming you to The First Annual General Meeting of your Company

The setting up of the Securities Trading Corporation of India Limited (STCI) as a distinct entity dedicated to the task of promoting the development of an active secondary market for Government dated securities marks a significant event for the gilts market. The Company commenced its operations in three segments, viz. Government dated securities, Treasury Bills and call/notice money market during the year

Performance of the Company

The report of the Directors and the audited accounts of the Company for the year ended March 31, 1995 are already in your hand. I therefore propose to briefly touch upon the highlights of the Company's operations.

The Company commenced trading in Government dated securities from the third week of September 1994 and extended its operations to repo transactions from the last week of December 1994. The turnover achieved by the Company in Government dated securities and Treasury Bills was of the order of Rs. 39,631 crore and Rs. 310 crore, respectively. The Company's borrowings and lendings in the call/notice money market aggregated Rs. 18,825 crore and Rs. 7,593 crore, respectively.

The Company's income before depreciation and taxation amounted to Rs. 3,451.25 lakh on an average paid up capital of Rs. 186 crore approximately. Being a dealer in Govern-

ment securities, the Company, unlike banks, is required to 'mark to market' its entire portfolio of securities. After making adequate provision in this regard as also for depreciation on fixed assets and taxation, the net profit amounted to Rs. 414.67 lakh. Your Directors are of the view that taking into consideration the risk factors associated with the business of Government securities, it would be prudent to build up reserves at the early stage of the Company's development. Hence the Directors do not recommend any dividend for the financial year ended March 31, 1995.

During the current financial year (up to October 27, 1995), there has been a significant increase in the turnover of the Company in each segment of its activities which would clearly indicate that the turnover in Government dated securities and Treasury Bills for the full financial year 1995-96 would reflect a satisfactory growth of activity.

The Company's turnover in Government dated securities and Treasury Bills was nearly 32 times and 13 times the averages of month end stocks held during the first half of 1995-96 of which the turnover on outright basis was nearly 2 times and 12 times respectively. The Company has been regularly participating in the primary auctions in both Government dated securities and Treasury Bills. Its success ratio at the auctions during the current financial year so far (upto October 28, 1995) has been 42 per cent in the case of Government dated securities and 51 per cent in the case of Treasury Bills. These ratios are well above the ratios indicated by the RBI guidelines for Primary Dealers in Government securities.

Recent Market Developments

Pursuant to its efforts at product development in Government securities market, the Government of India issued for the first time in September 1995 floating rate bonds (FRB) of four year maturity, with half yearly coupon rate linked to a base rate, viz. the average rate of the implicit yields at cut off prices of 364 days Treasury Bills auctions during the previous six months ending August and February, plus a margin of 1.25 per cent, but with a floor coupon rate of 13 per cent. This new product is a welcome addition as the FRBs provide a hedge against interest rate risk. The cut-off yields at the auctions of both 91 day and 364 day Treasury Bills reached a peak of 13 per cent and 13.20 per cent, respectively in July/August 1995 and moved southward till the middle of September 1995 whereafter they resumed their northward movement in tandem with the tight conditions in the call money market. The call money market of late has been witnessing tight conditions culminating in the call rate touching 20 per cent on certain days. What is worrisome is the fact that the call rates have shot up despite the recent relaxations in the refinance facilities made available to banks by RBI against the

collateral of say that you intermediaries operations discourages in Government secondary market, therefore, o

ent securities. I am happy to say is one of the principal by the RBI for money market in the call money rates tivity in the secondary market ties. For developing an active gilts, stability in call rates is, important conditions

of Treasury Bills in the system y reduced since the middle of n a large volume of Treasury olume of competitive bids put 1 day Treasury Bills has been imes. As a result, a relatively n competitive bids has been RBI at the auctions. As ders are usually holders till ck of Treasury Bills available for eplenished and this does not g. It is hoped that the volume t in at the auctions will go up 'time, may I also urge the RBI ite measures to encourage e auctions for 91 day treasur will facilitate more active

ondary market

ware, several measures have nt times to develop an active Government securities. The company is but one of the / the RBI in this regard for an institutional framework of the market. RBI announced Dealers (PD) in Government any has applied for registration ent securities. It would be nalise the PD system by an bligations cast on PDs to offer o achieve a minimum turnover arket in Government securities a further fillip. There are, is of concern which need

to effectively perform their ons, the cost and availability ne crucial. As it is, the market l in terms of buying and selling unding source for stocks held is well as the availability of Government dated securities. In this context, a gradual market with more participants e mechanisms through which meet a part of their funding as requirements of securities ities. A fear is expressed in n active repo market would e of outright sales/purchase opinion, however that in the

early stages of the development of the market when only a handful of PDs would be in place, the repo market should turn out to be a good mechanism for meeting the funding and scrip requirements of dealers, which would encourage increased trading in Government securities on outright basis by providing holders the flexibility of choosing the time for such trading. I would therefore, suggest that RBI may consider widening the repo market both in terms of participants and the eligible Government dated securities. In this context, it is an encouraging sign that a large number of dated securities, now being offered by RBI in the primary market are declared as eligible to repos.

Secondly, with regard to funding sources for the PDs, while they will have access to such lines of credit as the RBI may provide, they will need to raise additional resources from the commercial banks and other sources. In this context, it is important that the commercial banks be freed to lend to PDs at such commercial rates as may be negotiated between them even below their prime-lending rates. Unless this is done, the cost of borrowings of PDs may become exorbitant for the purpose of financing the holding of gilts.

Thirdly, to add depth to the secondary market, it is necessary to widen the base of the primary market for Government securities. With the Government's willingness to borrow at market related interest rates since June 1992, a beginning in this direction has already been made. However, a large section of the non-captive investors would be motivated to access the secondary market if such investors are provided with satisfactory custodial services by banks. Although a few banks have already moved in this direction, a larger number of banks may have to take up this activity in the interest of investors in the retail market. In this context there is a view that PDs could themselves establish a network of satellite dealers who could access Government securities for the retail investors. While this idea is certainly worth pursuing, it may however, take somewhat longer time to fructify. Furthermore, with the growth of the mutual fund industry, it should be worthwhile to set up separate mutual funds dedicated to gilts as is the trend in many developed markets. This would enable a large section of individual investors interested in risk-free assets yielding steady income to invest in Government securities without procedural hassles. I would urge the mutual fund industry to look to the gilts market for accessing top quality assets with reasonable yields more actively than they have so far done.

A large volume of Government dated securities continues to be held by captive investors like banks and financial institutions, most of whom tend to hold on to them till maturity though trading opportunities are now available. In regard to banks, whatever their limited buying and selling interests arise is mainly on account of SLR

adjustments. To some extent, the present norms for valuation of Government securities by banks do not motivate them to trade in them. Once banks start marking to market their entire portfolios of Government securities, which they will need to do sooner or later to achieve full balance sheet transparency, interest in trading in Government securities is bound to receive a stimulus.

Achievements and Prospects

Since the commencement of trading activity by the Company from September 1993, an enormous good interest has been generated in the Government securities market. The daily releases by the RBI of transactions put through Subsidiary General Ledger accounts (SGLs) in Bombay indicate that the volume of turnover on outright basis in Government dated securities is gradually picking up. The daily opening indicative two-way quotes being released by your Company since the last week of June 1993 for a few benchmark Government dated securities have been well received by the major players in the market and has created a sense of transparency in pricing as well as improved marketability. In the coming months, the Company's thrust would be in the direction of achieving a larger turnover in Government dated securities by continually narrowing spreads between its bid and offer prices. It is also the intention of your Company to widen gradually the list of Government dated securities in which it makes indicative two-way quotes.

It must be recognised that the business of dealing in Government dated securities involves far greater interest rate risk than that in the short-term money market instruments. Furthermore, when the PD system is in place in full strength, the market would become more competitive resulting in pressure on the Company's margin. As such, the Company would need to be cautious particularly in the initial stage of its operations. It would however be the earnest endeavour of your Company to work towards achieving a high volume of turnover and earn sufficient income so as to ensure to its shareholders adequate return on investment while also building up its reserves.

Acknowledgement

I take this opportunity to thank the Government of India, Government of Maharashtra, the Reserve Bank of India, commercial banks and co-operative banks and all India financial institutions for their co-operation and support.

I would like to place on record my deep appreciation of the sincere and dedicated efforts put in by the officers and staff of the Company for stabilising the operations of your Company in a short span of time and at the same time earning a profit in the very first year of its operations despite difficult market conditions.

Discourse of Difference

Nira Wickramsinghe

Ideologies of the Raj, The New Cambridge History of India, III 4 by Thomas R Metcalf, Cambridge University Press, 1994; pp 244.

THE original *Cambridge History of India*, published between 1922 and 1937 did much to formulate a chronology for Indian history and describe the administrative structures of government in India. Needless to say, it has been overtaken by mass of new research published over the last 50 years and stands today solely as a source or as a testimony of how the Raj historians wrote history, and constructed a historiography where the past was always the present. The massive six volume *Cambridge History of India*, writes Thomas Metcalf, 'sought to comprehend all of India's past in a single narrative that led inevitably to the Raj' (p 155). The *New Cambridge History of India* series, to which Thomas R Metcalf's book belongs, is designed to take full account of recent scholarship and changing conceptions of South Asia's historical development.

Thus, *Ideologies of the Raj* examines the ways in which the British sought to justify and thus legitimate their rule over India. Indeed from the mid-18th century, as the East India Company embarked on its career of conquest, the British had to confront the question of how a people steeped in the ideas of nationalism and liberalism, could claim the right to control a vast Asian continent. Thomas Metcalf demonstrates eloquently that the British devised two divergent strategies to justify their authority: one defined essential characteristics which the Indians shared with the British themselves, while the other emphasised the presumed qualities of enduring 'difference'. Over time, however, it was the differences – differences of history, race, gender and society – which embedded themselves most deeply in the British idea of India, and so became predominant. Since the British constructed few explicit ideologies of empire, the author explores the workings of the Raj through a study of its underlying assumptions as revealed in policies and writings. This timely book fills an enormous gap in scholarship as the author, drawing from his own research as well as from the writings of younger scholars in India and elsewhere, provides us with a synthetic view of the ideologies of the Raj during the years of uncontested British supremacy from 1858 to 1918. As the British did not explicitly construct an ordering system of ideology for their imperial enterprise, Metcalf has attempted to tease

out information from an array of sources ranging from the census to the layout of British Indian residential areas, in addition to works of political theorists such as James Mill or Henry Maine and works of imaginative literature. The result is a rich bounty of insight and documentation. Of course, those familiar with the writings of B S Cohn or David Arnold will not be surprised or provoked by the argument put forward by Metcalf but the purpose of the author and of the series is not to be absolutely original, rather to present the most important findings in Indian history of the last few decades.

One of the greatest merits of Metcalf's approach is that it acknowledges the changes that took place in the ideological justifications of empire in the 18th, 19th and 20th centuries and does not paint a uniform and static picture of a Raj guided by one overarching ideology or theory of governance. As the author writes, "At no time was the British vision of India ever informed by a single coherent set of ideas" (p x). This book shows the subtle contradictions that informed these ideologies and the manner in which they were dealt with.

Chapter one examines the intellectual foundations upon which, during the 18th century, the British constructed their rule in India. The author surmises how in the last decades of the 18th century, shaped by notions of 'Oriental despotism' together with a belief in an India once magnificent but now fallen, the British began to put together what was to be an enduring vision of this land. Fundamental categories of analysis were set in place, a comparative philology was constructed and the enduring structures of what were to be 'Hindu' and 'Muslim' law were established. The contribution of Hastings and William Jones to forging an ideology for the new Raj, followed by that of the Romantics which include such figures as Thomas Munro, John Malcolm and Mountstuart Elphinstone who challenged much in the Cornwallis system with its faith in impersonal laws and limited government, is clearly explained in this introductory chapter.

Chapter two entitled, 'Liberalism and Empire', shows how with the coming of Lord William Bentinck as governor-general in 1828, free traders, utilitarians and

evangelicals created a distinctive ideology of imperial governance shaped by the ideals of liberalism informed by the thought of Adam Smith and Jeremy Bentham. But after 1857 the ideal that India could somehow be made over in the image of Britain had to contend with newly powerful, alternative visions of empire. After the 1857 mutiny and the establishment of the crown rule in India, liberalism witnessed a period of crisis. A form of authoritarian liberalism encapsulated in James Fitzjames Stephen's *Liberty, Equality, Fraternity* (1873), linked with parallel theories of scientific racism and historical jurisprudence powerfully reshaped Britain's imperial ideology where difference between Indian and Briton was emphasised.

The third chapter examines the persisting tensions between the claims of similarity and those of difference as they informed the ideology of the late Victorian Raj in the arenas of history, race, and gender, where the motif was the decline of India from an ancient aryan glory. Metcalf examines in a particularly innovative manner how India's downward trajectory – in the British view – was most visibly manifested in its art and architecture. The construction of gender within the empire did not take shape in an explicit formulation. Metcalf examines the British ideas of their own masculinity as they sought to 'rescue' India's 'degraded' women, at the notion of India as a 'feminised' land, at once seductive and dangerous, at the presumed 'effeminacy' of Indian men and the ambiguous position of the white woman caught up in the centre of hierarchies of race and gender.

Chapter four assesses how, in the light of their understanding of India's past – and its present – the British devised structures for ordering its society. Indeed the strategies devised by the British to comprehend India were never simply intellectual exercises, nor were they meant only in some general way to justify British rule over the subcontinent. Through them what the British conceived of as India's enduring difference was given shape in administrative practice. Indian ethnography asserted rigorously its scientific claims. Its categories, embedded in censuses, gazetteers and revenue records, became even more closely tied to the administrative concerns of the colonial state. The valorisation of caste difference as fixed and immutable found perhaps its most striking expression in the creation of the two opposed groups of 'criminal tribes' and 'martial races'. Further the notion that there existed distinct 'Hindu' and 'Muslim' communities in India took on a fixed shape. The British came to believe that adherence to one or the other of these two religions

was not merely a matter of belief but defined membership more generally in a larger community To be Hindu or Muslim by itself explained much of the way Indians acted

The fifth and last chapter explores the British response to the crisis of the Raj in the late Victorian and Edwardian era. It begins, in its first two sections, with a discussion of the cultural and psychological mechanisms the British used to cope with a land of both danger and desire. The last two sections, returning to politics, look first at the construction of constituencies meant to bulwark a vulnerable Raj, and then at a frontal assault, from within the ideals of British liberalism, upon the ideology of difference itself.

The epilogue looks at the ideology of differences during the era of contest between the Raj and nationalism in India and concludes that the enduring contradictions between the ideologies of liberalism, and of difference, have come back home as Britain copes with the multiculturalism of the 1990s.

The epilogue is followed by an excellent bibliographical essay which is both chronological and thematic.

This is in short an excellent book well argued and well written. One hopes that it will be complemented by another volume which will look at some issues which this book eludes. Indeed Thomas Metcalf willingly avoids examining the Indian response to the ideologies imposed upon them by the British and focuses exclusively on the ways in which a system of knowledge about the British and the Indian was created to sustain the British Indian Empire (p xi). His argument based mainly on currently fashionable theories of overwhelmingly dominant colonial discourse where western categories and modes of analysis are held responsible for the cutting-up of Indian society into distinct often mutually opposed blocs of caste, tribe or religion leaves this crucial question unanswered: how and to what extent did this colonial discourse of difference really dominate the subcontinental mind?

author ends up with a new insight into the issues involved.

From pre colonial time the land tenure system in Bengal included the categories of superior landlords (actually revenue collectors) and the actual cultivators (commonly known as *raiyats*). The Permanent Settlement of 1793 lent this structural pattern in enduring life followed by different legislations of 1794, 1812, 1822 and 1844. Subsequent history witnessed at least two important developments: the growth of subinfeudation (thanks to regulation of 1819) as a response to superior landlords' failure to grapple with the timely implementation of revenue collection responsibility; and the unbridled exploitation of the cultivating *raiyats* by all categories of landed interests by dint of absolute control accorded to them over the toiling masses [Sen 1982]. The scores of surrogate developments witnessed capitalist incorporation of Bengal agriculture with the outer world through the introduction of cash crops (e.g. jute, indigo) and the institutional mechanisms embracing marketing network. However, the predominance of peasant production unit survived for a long time to come. In the words of one perceptive writer on the period, "The typical unit of production which was preserved rather than transformed during the colonial and immediate post colonial periods was the peasant small holding" [Bose 1993: 68].

Successive developments also witnessed the rise of intermediate classes at the cost of those occupying the peak of the structure, commonly known as zamindar. Particularly the rise of the jotedar class preserved the pre-capitalistic niches of the colonial agriculture. Dwarfed peasantries were gradually forced to resist unrestrained exploitation by the superior landed interests with the result of a series of enactment of tenancy laws in favour of the actual cultivators. In fact the oscillation of the tenancy laws towards the interest of the cultivating peasants began from 1859 pronouncedly with the enactment of the Act. It intensified with the promulgation of Bengal Tenancy Act of 1885. The acts of 1928 and 1940 were the concluding steps to the strong grounding of the peasants' rights before the ultimate demise of the zamindari system in the early 1950s of the present century, at least in legal terms. However, whom we are calling peasants were not a homogeneous body and one of the major thrust of the book under review is to bring home a fact that the peasants themselves were differentiated and inclined to exploit each other. In the wake of enactment of Bengal Tenancy Act of 1885 the transfer of land among the cultivators or *raiyats* became widespread. Already they were accorded with the

Agrarian System in Eastern Bengal, C1870-1910, by Nariaka Nakazato, K P Bagchi and Company 1994, pp xxiii+337 Rs 330

DEVELOPMENT of the agrarian structure of Bengal in the last several decades encountered complexities of unfathomable depth. In point of fact the complexities were the outcomes of, *inter alia*, various development and changes that occurred in the land tenure system and the advent of colonialism was an important moment among them.

Agrarian System in Eastern Bengal C1870-1910 authored by Nariaka Nakazato, a Japanese social historian, dwells at length on the structural development in agriculture by way of focusing on the events in the land market that took place at the close of the 19th century and the early years of the following century. Its span is between 1870 and 1904. Against the backdrop of disparate findings and perspectives of previous studies on the development of the agrarian structure in Bengal during the colonial period the present study sets out its own agenda of inquiries – in author's words, 'a consistent analysis of agrarian system in eastern Bengal during the height of British colonialism' (p vii).

At the opening of the book the author is seen to confront the major views formulated on the nature of structural changes in the agriculture of Bengal during the period of colonialism, a part of which is the focus of

Nakazato's own study. Incorporated views include the 'continuity' thesis of Ray and Ray, depeasantisation and differentiation thesis of Chaudhuri, 'semi-feudal' characterisation by Chatterjee and differential structure thesis of Bose. He departs from what others surmise and in course of the book comes up with his own. His attention is limited to eastern Bengal constituting of the districts of Dacca, Fardpur, Mymensingh and Barisal.

The methodology of the book bears a distinct feature. The author sifted through land transfer records of the settlement offices. The settlement records prepared by the Registration Department began to be published from 1865-66 bearing the title *Report on the Administration of the Registration Department in Bengal*. Accounts of land transfer in terms of possession and ownership are featured here with specific information on tenurial category, amount of land, its value, etc. The author stresses the reliability of the records he used in the following way: "The most authentic published source materials on the land market are the annual administrative reports of the Registration Department" (p 7). Weaving together disconnected information derived from a plethora of settlement records in an investigative and rigorous manner the

occupancy rights with a few preconditions, the 1885 Act reached the point of approving them of selling the rights of cultivation to others ensuring conformity with the local customs. The author examines the implication of such vigorous transfer of land by the peasant cultivators on the agrarian structure vis-à-vis that of the superior landlords, and contends that the process produced a new class of upper raiyats.

The book consists of three major parts of the depiction of two important planks of the colonial Bengal—the peasant and the landlord. Part one with the focus on land market consists of seven chapters; part two consists of eight chapters laying pivotal emphasis on the features, process and the operation of zamindari system derived from the official records of the estates. The third part encapsulates the conclusion of the book.

For the purpose of the examination of the land market it was divided into two segments. In author's own words—'we should divide the land market into two corresponding segments: the peasants' land market (the market for the landed interests normally held by the peasant classes) and the landlords' land market (the market for landed interests generally possessed by the landlord classes)' (pp 8-9). The author is aware of the limitation of the method he has followed and reminds in the following terms—'our method has not taken account of the fact that a clear line of division could not always be drawn between a landlord and a peasant in eastern Bengal' (p 9). His next step is to verify the magnitude of land transfer in two different markets and it is captured that the most vibrant market was those of the peasants than the landlords. And the quantum of difference is indeed spectacular and widening over time. Nakazato comments—'It will be clear that the land market had rapidly expanded in terms of both number and value. In particular the peasants' land market moved forward at an extraordinary pace. Taking 1875-76 as the base year, it recorded an impressive increase of 6.9 times in number and 10.5 times in value. The landlords' land market by contrast registered only a modest growth—1.4 and 2.2 times in number and value respectively. In 1875 the transaction carried on in the peasants' market accounted only for 22 per cent in number and 10 per cent in value of the total volume of trade. However by 1904 these percentages had shot up to 58 and 34 respectively owing to the uneven development of the two segments of the land market' (p 17). The author notes two diverse trends in the peasants' land market. On the one hand, a group of raiyats rose the structural ladder further while another group slid down. About the constitutive feature of the process it is noted—'a great number of poorer raiyats were

turned into 'bargadars', while the upper strata of raiyats and some sections of landowners transformed themselves into the jotedar-type landlords. The latter exacted produce rent from the former at a much higher rate than the customary rate of rents' (p 279). It is further commented, 'the complex trends in land transfer seen in Dacca around the turn of the century boil down to a pair of sharply contrasted phenomena: the stagnation of the landlords' land market taken as a whole and the vigorous growth of the peasants' land market' (p 27). About the characteristic impact of the change on the agricultural system it is observed, 'the new landlordism (was) semi-feudal landed property because it came into existence chiefly through the stratification of the peasantry which was the paradoxical result of the advancement of the peasants' power' (p 293). It is noteworthy that the author consciously evades the term differentiation. It is reminiscent of the failure of the newly propertied peasant class to advance the production system to a more generative stage similar to the American or the Rich Peasant path of the emergence of capitalism [Byres 1991]. In fact this finding opens completely new perspective for consideration: what were the causes of the failure of the development of capitalism in Bengal during the regime of colonialism. However, it does not come within the purview of the issues the present

study addresses. At the same time it should not be forgotten that the zamindars or the superior landlords did not give up completely their control to extract the benefits. They accepted the peasants' transferable rights of land in return of heavy fees they accumulated from the peasants [Islam 1988: 38].

In the second part the book dwells on different aspects of zamindari system. Although such attempt does not entirely match with the kind of things carried out in the first part of the book, it bears certain pertinence insofar as agrarian system remains the central focus of the book. Forty-one estates of varying sizes are subjected to investigation. The largest estate emanated an annual rent and cess demand to the amount of Rs 11,59,641 and the smallest one Rs 568. Discussions and analysis provide fascinating details about their social dimension, property implication, managerial approaches as well as the system of coercion. But what is lacking is the exploration of the changing features of the land system of Bengal at a particular period which happens to be the cardinal theme of the book.

Of the 41 estates chosen for examination one has been investigated at length. Among other dimensions, the emergence, operation, nature of tenures, management of financial affairs, geographical distribution and the

economic base of the Kanakshar estate from the Faridpur district are probed. The estate originated with Jagabandhu Chatterjee who happened to be 'a petty official of some government office related with revenue business'. Regarding the zamindari status of the estate the study notes: 'The main portion of Kanakshar consisted of various intermediate tenures. The Chatterjees therefore had more of intermediate tenure-holders than of zamindars or independent 'talukdars'. However the colonial authorities treated them as 'proprietors' because they owned proprietary rights, that is shares in some independent 'taluks'. The Chatterjees virtually were 'patnidar' of Kali Krishna Jagore of Calcutta' (p. 117-26). The selected estate was of medium sized 5459 acres of land with an annual rental of Rs 20307. Jagabandhu's grandson embraced educational career to become 'bhadralok' or a member of educated middle class leaving behind zamindari. The development of the estate was on the other hand full of events with tussle between the landed interests reaching to the point of clashes and employment of intrigues like caste politics to expand and consolidate the zamindari. This particular estate consisted of a wide ranging array of tenures. It included 22 independent taluks, 47 intermediate tenures and 4 rent free tenures.

The communal and ethnic composition of the landlords was 31 Hindus, five Muslims and five Europeans while the caste composition was 11 brahmans, two baidyas and three kayasthas. Others' caste background could not be ascertained. About the longevity of the zamindars the book says that only three out of 41 existed before the appearance of the colonial rule, seven existed or appear to have existed since British rule and the rest emerged after the British assumed power in Bengal. Regarding the landed property of the estates it is noted, 'there were a class of landlords who built solid landed properties with a higher degree of direct contacts with the raiyats by means of concentration of landed interests in one area as well as by dint of the buying of tenures of lower grades. It was this type of landlords that constituted the mainstay of landlordism in eastern Bengal' (p. 195). Regarding the management system of the estates, a brief historical background of the land management system during the pre-colonial period is sketched to identify the major changes that took place with the emergence of colonialism. In the former system the village authority and the 'mandal' used to play exclusive role in regard to revenue collection and land management which gradually went into the hands of 'tahsildar' or revenue manager. Of course, there were management systems like 'khas', farm and

'patni', however, the predominant form was tahsildar.

Pre-capitalistic inclination of the landlords got surfaced with their use of indirect coercion on the cultivators to collect rent and maintain control. Sometimes they maintained mercenaries for this purpose. The author recalls the special role played by *abwab*. 'In Bengal rent consisted of two parts, viz. legal rent and illegal cesses. The latter were usually called *abwabs* and the landlords were strictly prohibited by the colonial government from imposing them under pain of penalties. None the less it was an open fact they never stopped exacting *abwabs*' (p. 238). A number of case studies on the estates and reports are used to verify the issues of rent. Rent collection was pretty complicated. The factors like quality and kinds of crops, size of lands and others which under planned fix rent were hardly taken into account in Bengal. However, the author feels that the pitch of rent was moderate. For instance, survey and settlement operation estimated average pitch of cash rent paid by the settled raiyats at the rates of Rs 48/10, Rs 29/2 and Rs 2/13. One acre in Bakerganj, Faridpur and Dacca at the end of 19th century. But for the non-occupancy cultivators like the 'bargadars' it was pretty high. If 50 per cent of the produce was to be paid as rent then what is left for the consumption and investment for the cultivators? In the same vein it is to be remembered that there was frequent *abwab* to be exacted from the settled cultivators. The second part of the book thus gives an appraisal of zamindari's 'thickly feudal character' although various things of it do not conform with the common notion of feudalism (p. 294).

What do we learn from the empirical details and analysis presented in Nakazota's study? The study is about a set of new dynamics and its consequences for the land market in eastern Bengal during the concluding phase of the British colonialism. The book has significantly enriched the debate. Still we come across conflicting views about the nature of agrarian structure and its dynamics of change in contemporary Bangladesh. Does the rise of a new peasant class as mentioned in Nakazota's study differ significantly from the class of 'jotedar', if the former are a class of men who owned sizeable portions of village lands and cultivated their broad acres with the help of sharecroppers, tenants-at-will and hired labourers [Raj and Ratna Ray 1975: 82]. Of course the 'jotedars' were a class unacquainted with the plough but how different are the accumulating peasants of Nakazota's study who grew rich on moneylending business and distanced themselves from the toiling masses in course of time? Perhaps there were certain deeply embedded structural factors which led the

new owners of the land to assume a feudal semi-feudal character. Or should we accept the kind of interpretations forwarded by Shinn (1972) in the context of Russian peasant mobility pattern or its application by Van Schendel (1986) to rural Bangladesh spanning a period which partly overlaps with the one Nakazota deals with? Bose has emphasised. Social anthropological work on rural east Bengal has suggested that instead of a process of unilinear class differentiation there is considerable multidirectional mobility in peasant society, centripetal trend consisting of the descent of richer peasant households and the rise of relatively poorer ones effectively countering centrifugal forces' [Bose 1986: 156].

This book is an important addition to the corpus of literature dealing with the agrarian structure of the colonial Bengal. It has drawn attention to a new horizon of inquiry, i.e. the enrichment of the Bengal peasants and their subsequent subsumption into a class more interested in unproductive exploitation of pre-capitalist times.

Note

1. Any enthusiastic reader would find not less than four distinct views about the characteristic features and dynamics of changes in the agrarian structure of rural Bangladesh presently [Khan 1995].

Literacy in India and China

Jean Dreze
Jackie Loh

This paper examines recent census-based evidence on literacy achievements in China and India. China is found to be far ahead of India in the field of basic education. In particular, China is close to the elimination of illiteracy in the younger age groups, while India is nowhere near achieving that goal. Educational disparities follow similar patterns in both countries, but tend to be sharper in India. China's lead in basic education was established during the pre-reform period, based on a strong commitment to the widespread and equitable provision of schooling facilities at an early stage of development. This contrast in educational achievements in China and India is crucial in assessing their respective development experiences and reform programmes.

Introduction

COMPARISONS between India and China have often been made in the development literature. These comparisons can indeed be quite enlightening, given the similar challenges faced by the two countries in the late 1940s, and the different routes they have taken in addressing these challenges. Right now, economic growth tends to be the most common focus of comparison, and there is indeed much to learn from China's achievements in this field during the 1980s and 1990s. In assessing that success, however, it is important to take note of the social conditions that have formed the basis of rapid and participatory economic growth in China over that period. One of these social conditions, which is solidly rooted in the 'pre-reform' period, is widespread literacy.¹

The importance of literacy, of course, is not exclusively or even primarily related to its role in promoting participatory economic growth. The diverse social and personal contributions of basic education also include the intrinsic value of activities that require literacy and related skills (e.g. reading newspapers), lower mortality and fertility rates, more informed participation in civil society and political activity, and so on. Even more important, perhaps, is the role of basic education as a tool of empowerment and redistribution. In India, the persistence of widespread illiteracy among disadvantaged groups tends to reinforce diverse kinds of social inequality (e.g. relating to class, caste and gender), and the expansion of basic education must certainly be seen as an essential requirement of more rapid elimination of these inequalities, and of positive social change in general.

Against this background, a comparison of India's and China's experiences in the field of basic education may be of some interest. Indeed, the expansion of basic education at an early stage is an essential

feature of China's development experience, just as the persistence of widespread illiteracy is one of India's most serious social failures. In this paper, we attempt to bring out the main features of this contrast, and comment briefly on its causes and implications.

I

Methodological Issues

1.1. SOURCES AND DEFINITIONS

Recent censuses in India and China provide reasonably reliable sources of information on literacy rates.² India conducted censuses in 1981 and 1991, and China in 1982 and 1990. For convenience, we shall understand the reference year '1981-82' to mean 1981 for India and 1982 for China, and '1990-91' to mean 1991 for India and 1990 for China.

According to the official instructions to census investigators in India, a person is to be considered literate if she or he "can both read and write with understanding in any language".³ In cases where an investigator is in doubt about the reading or writing abilities of a particular person, the investigator is supposed to ascertain her abilities on the basis of simple practical tests: "The test that was applied for reading was the ability to read any portion of the printed matter in the enumerator's instruction booklet (provided the person was familiar with the language used in the booklet) and the test for writing was the ability to write a simple letter". Discussions with census investigators, however, suggest that actual tests of this kind are rarely performed.⁴ It appears that, in practice, the respondent's self-reported literacy status is usually accepted by the investigator.

The absence of objective literacy test in census investigations raises the possibility of two different kinds of reporting biases. First, there may be a systematic tendency

on the part of *respondents* to overstate or understate their literacy status. Second, *investigators* may have their own reasons to overstate or understate. Census investigations, for instance, are often conducted by local school teachers, who may be inclined to exaggerate literacy achievements in their own locality.⁵

It is unlikely, however, that these possible biases lead to major distortions in census-based literacy rates for India. Literacy rates based on census data are highly consistent overtime, and they are also broadly consistent with independent information collected by the National Sample Survey, based on similar literacy criteria.⁶

As far as China is concerned, census publications distinguish between different literacy levels: 'literate' (knowledge of more than 1,500 characters), 'semi-literate' (500 to 1,500 characters) and 'illiterate' (less than 500 characters).⁷ In practice, census investigators are expected to count a person as literate if she or he is able to read a newspaper and to write a simple letter.⁸ This criterion of literacy is quite similar to that used in Indian censuses. Following what appears to be standard practice in official Chinese publications, the literacy figures reported in this paper refer exclusively to 'full' literacy (1,500 characters or more), with the 'semi-literate' and 'illiterate' categories being amalgamated.

As with the Indian censuses, the recent Chinese censuses appear to provide a reasonably reliable source of information on literacy achievements. The general quality and consistency of these censuses have been extensively scrutinised by demographers, and there is, to our knowledge, no evidence of these results being flawed in a major way.⁹ The literacy rates derived from the 1982 and 1990 censuses for different provinces and population groups are themselves highly consistent. While it is important to submit these figures to further

FIGURE 1A ADULT LITERACY RATES IN INDIA AND CHINA (1981-82) FOR DIFFERENT POPULATION GROUPS

Note: The Indian literacy rates apply to persons aged 7 and above, and the Chinese literacy rates apply to persons aged 15 and above. As discussed in the text, 7+ literacy rates in India are usually a little higher than the corresponding 15+ literacy rates.

Sources: CASS (1987) (based on census data) and Government of India (1987).

FIGURE 1B ADULT LITERACY RATES IN INDIA AND CHINA (1990-91) FOR DIFFERENT POPULATION GROUPS

scrutiny, there are no grounds to reject them as things stand.

1.3 COMPARABILITY ISSUES

The comparison of census based information on literacy rates in India and China raises several methodological issues.

First, in order to compare like with like it is important to focus on the same age groups for both countries, as far as possible. The 'adult literacy rate' usually refers to the literacy rate in the age group of 15 years and above.¹⁰ Information on literacy rates for that age group is available for 1982 and 1990 in the case of China, and for 1981 in the case of India. Unfortunately, literacy rates for the 15+ age group from the 1991 census in India have not been released at the time of writing. For 1991 literacy rates are currently available only for the population as a whole ('crude literacy rate'), and for the age group of seven years and above. We will be using the latter, in this paper, for comparison with the 15+ literacy rates derived from China's 1990 census. Similarly, we will be using the cut-off of seven years and above for Indian literacy rates in 1981.

In this connection, we should mention that 7+ literacy rates in India are usually a little higher than 15+ literacy rates (this is because, as one might expect, the literacy rate in the 7-14 age group tends to be higher than the

literacy rate among persons aged 15 and above). For instance, in 1981, the 7+ literacy in India as a whole was 43.6 per cent compared with 40.8 per cent for the 15+ literacy rate. The same pattern can be observed in all Indian states (for 1981), with the 7+ literacy rate typically 2 to 4 percentage points above the 15+ literacy rate. Having said this, the 7+ and 15+ literacy rates are sufficiently close to each other in all Indian states (see Figure A1 and also Tables A1 and A2) to ensure that nothing will be lost in this paper by approximating the latter with the former.

Second, in interpreting literacy rates for the population as a whole, or even for the

TABLE 2 LITERACY RATES IN INDIA AND CHINA IN DIFFERENT CENSUS YEARS

	China 6+	India 5+	India 7+
1961/64*	43.2	78.4	-
1981/82	68.1 (26)	41.4 (19)	43.7
1990/91	79.4 (19)	-	52.2 (17)

Notes: The reference year is 1961 for India and 1964 for China.

The figures in brackets indicate the annual growth rate of literacy since the preceding reported census.

TABLE 1 LITERACY IN INDIA, CHINA AND KERALA

	Literacy Rates, 1981-82				Literacy Rates, 1990-91			
	Adults ¹		Adolescents (Age 15-19)		Adults		Adolescents ¹ (Age 15-19)	
	Male	Female	Male	Female	Male	Female	Male	Female
India	56	30	66	43	64	39	74	52
China	79	51	96	85	87	68	97	92
Kerala	88	76	95	92	91	86	98	98

Notes: * Age 15+ for China, 7+ for India and Kerala (Indian Census data for the 15+ age group in 1991 have not been published at the time of writing). As mentioned in the text, 7+ literacy rates in India are usually a little higher than 15+ literacy rates.

¹ The reference year for India and Kerala is 1987-88; the reference age group for Kerala is 10-14.

Sources: The Indian figures are compiled from Government of India (1987), Table C-2; Tyagi (1993), Table 10; and Sengupta (1991), Statements 3.5, 3.6 and 4.1. The Chinese figures are from State Statistical Bureau (1985), Table 49, and State Statistical Bureau (1993a), Table 5.12. All are based on census data except for the 1987-88 age-specific rates for India and Kerala which are based on National Sample Survey data.

15+ age group, it should be borne in mind that the Indian and Chinese populations have different age structures. For instance, old people represent a slightly larger share of the population in China than in India, and this has the effect of driving down the crude literacy rates (or adult literacy rates) in China for a given profile of age-specific literacy rates. This particular feature, of course, has to be considered along with other contrasts between the Indian and Chinese population structures (e.g. due to differences in fertility rates, or to the demographic effects of the 1958-61 famine in China).

Taking the whole age structure into account, it seems that age-structure effects play a negligible role in the particular contrasts that will be considered in this paper, and can be ignored for our purposes. Consider, for instance, the adult literacy rate (age 15+) in 1980-81. When 1981 age-specific literacy rates for India are combined with the age structure of the Chinese population at that time, they give an average literacy rate of 41.1 per cent for the 15+ age group, this is very close to India's actual adult literacy rate of 40.8 per cent in 1981 (obtained by combining the same age-specific literacy rates with the age structure of the Indian population). Similarly, the Chinese age-specific literacy rates give an adult literacy rate of 65.9 per cent when they are combined with the age structure of the Indian population, again very close to the actual 15+ literacy rate of 65.8 per cent in 1980 (obtained by combining these age-specific literacy rates with the age structure of the Chinese population). In other words, differences in age structure account for a very small part of the observed contrast in adult literacy rates in India and China.

Third, it can be argued that literacy is a more demanding achievement in China than in India. The Indian alphabets typically consist of a few dozen letters (e.g. the most widely-used among Indian scripts, 'devnagiri', is based on an alphabet of about 60 letters), which are relatively easy to assimilate compared with the thousands of characters required for literacy in Chinese languages. The number of characters or letters, of course, is not a definitive criterion of comparison, since literacy in Chinese only requires character recognition while alphabet-based reading involves the additional skill of combining letters into a recognisable word or idea. But the fact remains that literacy skills in Chinese typically take several years to acquire (and can only be retained with regular practice), while literacy in Indian languages can often be achieved within a few months.

Taken together, these different considerations suggest that China's lead over India in the field of basic education is actually a little larger than the literacy figures presented

in this paper suggest. While age-structure effects can be ignored without much loss of precision, the use of an age cut-off of seven years for India artificially raises the Indian literacy figures by a few percentage points. The fact that literacy is a more demanding educational achievement in China than in India also has the effect of making India look a little closer to China than it really is, when their comparative achievements are assessed on the basis of literacy rates. Even then, however, India does look remarkably backward in comparison with China, as will be seen in the next section.

II

Literacy Achievements Compared

II.1 THE BASIC FACTS

China is a far more literate nation than India. In 1990-91, almost half of the adult population in India was illiterate, compared with only 22 per cent in China. Even more significantly perhaps, by that time China had nearly succeeded in achieving universal literacy in the younger age groups, with illiteracy being overwhelmingly concentrated among the older age groups. In India, by contrast, there is still a massive problem of illiteracy in the younger age groups (Table 1).

Another serious aspect of India's failure in the field of basic education is the highly uneven distribution of educational achievements. Illiteracy, in particular, tends to be concentrated among disadvantaged social groups. Literacy rates tend to be much lower among women than among men, in rural than in urban areas, and among scheduled castes and tribes than in the population as a whole. There are, also, striking regional disparities in literacy rates, with Kerala being in the same league as the most advanced countries of the developing world while states such as Rajasthan or Bihar have literacy rates that are more typical of the least developed countries of sub-Saharan Africa. These diverse inequalities,

combined with a low average literacy rate, account for extremely low levels of education among the most disadvantaged sections of the population (Section II.4).

Educational disparities between different regions and social groups can also be observed in China, but these are generally less pronounced than in the case of India. As can be seen from Figures 1a and 1b, the difference in literacy rates between India and China is particularly large for disadvantaged groups (e.g. rural women), reflecting the greater intensity of educational inequalities in India. The rural-urban gap, in particular, is considerably smaller in China than in India. China appears to have been far more successful than India in promoting basic education in rural areas, and this is consistent with the general emphasis that the Chinese leadership has placed on economic and social transformation in the countryside (in contrast with the pronounced 'urban bias' of public policy in India). Similarly, educational policy in China has given overwhelming priority to the expansion of primary education, and this contrasts with the elitist bias of India's educational system, which combines a resilient neglect of primary education with enormous public investments in higher education. Educational achievements are not only much lower in India than in China, they are also much less equitably distributed.

One outstanding exception to the general

FIGURE 2: COMPARISON OF 1982 AGE-SPECIFIC LITERACY RATES (ALL-CHINA) WITH ESTIMATES BASED ON 'BACKWARD PROJECTION' FROM THE 1990 CENSUS

Note The crossed squares indicate the actual 1982 literacy rates in different age groups (the position of a crossed square in the horizontal scale indicates the mid-point of the relevant age group). The crossed diamonds indicate estimated literacy rates based on 'backward projections' from the 1990 Census (see text for further discussion of the projection method).

Source: SSB (1985) and SSB (1992)

pattern of educational backwardness in India is the state of Kerala. In fact, as will be shown in Section II.3, Kerala is not only far ahead of all other Indian states in terms of literacy achievements, it is also ahead of almost all the Chinese provinces (and in some respects, e.g., adult female literacy, ahead of all Chinese provinces). Aside from being a momentous success story in itself, Kerala's literacy record is also a useful benchmark against which to assess both the achievement of China (where educational expansion began much later than in Kerala), and the under-achievement of the rest of India. In the following elaboration of the basic issues raised in this section, this benchmark will be used to inform and supplement the broader cross-country comparisons.

II.2. HISTORICAL PERSPECTIVE

China's 1982 census appears to be the earliest available source of comprehensive information on the country's literacy status, with published figures available by gender, age, province, and residence (rural/urban). Two earlier censuses have been conducted in 1953 and 1964. The 1953 Census, however, apparently failed to produce reliable information on education or literacy.¹¹ The

1964 Census indicates that the national literacy rate for the 6+ age group was 43 per cent in that year (Table 2).

The historical record of literacy in India is far more complete, with fairly detailed and reliable literacy figures being available from decennial censuses from the late 19th century onwards. In comparison to China's 1964

figure of 43 per cent for literacy in the 6+ age group, the all India literacy for the 5+ age group in 1961 was 28 per cent. Thus, China already had a substantial lead over India in the early 1960s.

The rate of progress of literacy rates in India and China before and after 1981-82 may be worth mentioning. The annual percentage increase in literacy rates was 2.6 per cent in China during 1964-82, and 1.9 per cent during 1982-90, the corresponding figures for India were 1.9 per cent in 1961-81 and 1.7 per cent in 1981-91 (Table 2). These figures have to be interpreted with caution, since the growth rate of literacy is only one way of measuring the progress of literacy over time, and alternative measures of literacy expansion can lead to different rankings of the rate of progress in different periods and regions.¹² One reasonably robust observation, however, is that the pre-1982 period was one of particularly rapid expansion of literacy in China. Educational transformation in China, in other words, appears to have been particularly rapid in the period preceding the economic reforms initiated in the late 1970s.

An alternative, indirect way of assessing and comparing the progress of literacy in India and China prior to 1981-82 is to look at age-specific literacy rates in that year. To illustrate, the literacy rate in the 35-44 age group in 1981-82 can be taken as an approximation of, say, the literacy rate in the 25-34 age group 10 years earlier, or of the literacy rate in the 15-24 age group in 1961-62. Obviously, this 'backward projection' method can only be applied to the adult age groups, for which the implicit assumption of static literacy rates for given cohorts is not implausible. Even for adults, the backward projection method tends to overestimate literacy rates in earlier years,

TABLE A1: LITERACY RATES IN INDIA, 1981 AGE 7+

States	U/R Combined, 7+			Rural, 7+			Urban, 7+		
	P	M	F	P	M	F	P	M	F
Total	43.6	56.4	29.8	36.0	49.6	21.7	67.2	76.7	56.3
Andhra Pradesh	35.7	46.8	24.2	27.9	38.7	16.8	61.0	72.6	48.7
Bihar	32.1	46.6	16.5	27.7	42.4	12.4	61.8	73.2	47.5
Gujarat	52.2	65.1	38.5	43.6	57.8	28.8	71.0	80.7	60.2
Haryana	43.9	58.5	26.9	37.3	53.3	18.8	66.8	76.1	55.8
Karnataka	46.2	58.7	33.2	37.6	51.1	23.8	66.9	76.5	56.4
Kerala	81.6	87.7	75.6	80.3	86.7	74.2	86.9	92.0	82.0
Madhya Pradesh	36.6	48.4	24.0	29.3	40.8	17.3	64.6	76.4	50.8
Maharashtra	55.8	69.7	41.0	45.7	61.7	29.5	74.3	82.9	63.9
Orissa	41.0	56.5	25.1	37.8	53.5	22.0	64.8	76.4	50.9
Punjab	48.2	55.6	39.7	41.7	49.6	32.7	65.0	70.8	58.1
Rajasthan	30.1	44.8	14.0	22.5	37.0	6.8	58.0	72.3	41.5
Tamil Nadu	54.4	68.0	40.4	45.0	60.1	29.8	73.3	83.8	62.2
Uttar Pradesh	33.4	47.4	17.2	28.5	43.4	11.7	54.9	64.8	42.7
West Bengal	48.6	59.9	36.1	40.2	52.8	26.8	70.7	77.2	62.5

Note: Tyagi (1993) and Government of India (1992) give somewhat different figures for female literacy in Madhya Pradesh (19.0 as opposed to 24.0); the reason for this discrepancy between these recent publications and the original source (Government of India, 1987) is unclear.

Source: Government of India (1987), Tables C-2 and C-2A.

FIGURE 3 COMPARISON OF 1981 AGE-SPECIFIC LITERACY RATES (ALL-INDIA) WITH ESTIMATES BASED ON 'PROJECTION' FROM OTHER CENSUSES

Note: The crossed squares indicate the actual 1981 literacy rates in different age groups (the position of a crossed square in the horizontal scale indicates the mid-point of the relevant age group). The other symbols indicate estimated literacy rates based on 'projections' from other censuses (see text for further discussion of the projection method).

Source: Census data (Government of India, 1954, 1964, 1976 and 1987).

for two reasons. First, mortality rates are typically higher among illiterates than among literates, so that the literacy rate in a particular cohort can be expected to increase over time even if the literacy status of the surviving individuals remains unchanged. Second, the literacy rate in a particular cohort can increase over time due to adult literacy programmes.

This overestimation issue can be illustrated by comparing the actual 1982 literacy rates in particular age groups in China with the corresponding estimates obtained by 'backward projection' from the 1990 census. The results are presented in Figure 2 (see also Table 3). As this figure indicates, the predicted and actual literacy rates are remarkably close to each other, suggesting that backward-projected estimates are reasonably accurate, at least over a relatively short period. Interestingly, the largest differences between actual and projected estimates are found for women aged 25-34 in 1982, possibly reflecting the effect of adult literacy programmes targeted at that age group.

The extent of overestimation over longer periods can be scrutinised using Indian data for the 1951, 1961, 1971 and 1981 Censuses (as stated earlier, age-specific literacy rates

for 1991 are not available at the time of writing). Figure 3, which is similar to Figure 2, compares actual literacy rates for different age groups in India in different census years with projections from other censuses. Here again, it can be seen that the projected figures are reasonably accurate, even when the projections span a relatively long period.¹⁷

It should be added that, if our interest is not in absolute literacy rates in earlier periods, but in comparing literacy rates in India and China at different points of time, the overestimation problem is not necessarily very serious, as long as the extent of overestimation is quite similar in both countries. In short, there is no serious reason to dismiss comparisons of literacy rates in India and China in, say, 1951 based on backward projection from the 1981-82 Censuses.

In Figure 4, we present age-specific literacy rates in India, China and Kerala in 1981-82. If the backward projection method is valid, this figure allows us to trace the evolution of literacy over time in these three regions. The emerging pattern is quite startling. The estimated literacy rates for the 30+ age group in 1951-52 (i.e. the actual literacy rates for the 60+ age group in 1981-82) are almost exactly the same for India and China, suggesting that the adult literacy situation in both countries was very similar in the late 1940s. At that time, Kerala was way ahead of both India and China. As early as 1961-62, however, China had nearly caught up with Kerala in the younger age groups; for instance, the estimated literacy rates for the 10-14 age group in 1961-62 (i.e. the actual literacy rates for the 30-34 age group in 1981-82) are almost as high in China as in Kerala. By 1981-82, there was virtually no difference between China and Kerala for the younger age groups, while India was left far behind.

A more detailed breakdown of 1982 literacy rates in China by gender and age group is presented in Table 3.¹⁴ By backward projection, this table gives a more detailed picture of the evolution of literacy in China over time. The post-Liberation take-off is evident, for instance, in the large difference in literacy rates between the 40-44 age group (consisting of persons who would have been aged 10-14 in 1952) and older age groups.

TABLE A2: LITERACY RATES IN INDIA, 1981 - AGE 15+

FIGURE 4: AGE-SPECIFIC LITERACY RATES IN INDIA, CHINA AND KERALA (1981-82)

Source: Government of India (1987) and SSB (1985).

Among women, in particular, the 1982 literacy rate in the 40-44 age group (42.6 per cent) was three times as high as the literacy rate among women who were only 10 years older (14.8 per cent for the 50-54 age group).

In short, and subject to the qualifications attached to the backward-projection method, the following observations emerge from the preceding analysis: (1) India and China had very similar adult literacy rates in the late 1940s, while Kerala was far ahead at that time, (2) China's literacy take-off took place during the immediate post-Liberation period, with a particularly impressive leap for the younger age groups, (3) by 1981-82, China had caught up with Kerala in the younger age groups, while India was left far behind.

11.3 LITERACY RATES: 1981-82 AND 1990-91

The high absolute levels of literacy in China in 1982 are also worth underlining. For the 15-19 age group, literacy rates in that year were already as high as 96 per cent for males and 85 per cent for females (Table 1). Although these figures reveal the persistence of a substantial gender gap, they also indicate that China was rapidly moving, at that time, towards universal literacy in the younger age group. As mentioned earlier, this feature of the Chinese experience sharply contrasts with the educational situation in India, where

the eradication of illiteracy remains an elusive goal to this day, even for the younger age groups.

The nature of the India-China contrast in that respect, as early as 1981-82, can be further evaluated from Figure 5, where we present 15-19 literacy rates in that year for individual Chinese provinces and Indian states (the former are identified with lower-case letters, the latter in upper case). As this figure shows, it is not just that China was ahead of India at that time, in terms of literacy rates in the younger age groups, but also that, with two important qualifications,

no Indian state was clearly ahead of any Chinese province in that respect. Even the more educationally progressive states of India, such as Maharashtra and Tamil Nadu, had lower adolescent male literacy rates than the most backward Chinese provinces, and were only marginally ahead of a few Chinese provinces in terms of adolescent female literacy.

The two qualifications concern Kerala and Tibet. We have already noted Kerala's outstanding educational record. In Tibet, the adolescent male literacy rate in 1981-82 was not only much lower than the Chinese average, but also lower than the corresponding figure for any Indian state, the same statement applies to the adolescent female literacy rate, although, significantly enough, the states of Uttar Pradesh, Madhya Pradesh, Rajasthan and Bihar did no better than Tibet in that respect. The persistence of endemic illiteracy in Tibet, even in the younger age groups, stands in sharp contrast with the rapid educational advances that have occurred in all the other Chinese provinces. This localised failure has little effect on the overall Chinese literacy figures, since the population of Tibet is just over two million (1990 census figure), but it is of some political significance. The low level and slow progress of educational achievements in Tibet suggests some lack of political commitment of the Chinese leadership to the development of that region, and illustrates the exceptional dependence of social progress in China on the initiative of the state. If the leadership decides to ignore, or fails to recognise a particular problem, there is little scope for public pressure to challenge that inertia.¹²

Figures 6A and 6B present adult male and female literacy rates in India and China in 1981-82 and 1990-91, respectively. Both figures follow much the same pattern as Figure 5, with most Chinese provinces being well ahead of most Indian states. Comparing

the two figures, we find that literacy rates have improved in both countries during the 1980s (and indeed in all the individual states and provinces, except in the case of rural female literacy in Tibet), with little change in the relative positions.

While the improvement of literacy in China during the 1980s (bringing the country even closer to universal literacy in the younger age groups – see Table 1) is in line with earlier trends, there is some evidence of a significant change in the basis of educational progress in China before and after the economic reforms initiated in the late 1970s.¹⁶ The pre-reform period was a phase of low income levels and slow economic growth, and the transformation of educational levels during that period was less a reflection of growing affluence than a direct result of the firm commitment of the Chinese leadership to the widespread and equitable public provision of basic education. During the post-reform period, it is the rapid growth of private incomes that has formed the main basis of further educational improvement, and there has been less success in the further expansion of public schooling facilities, especially in the slow-growing rural areas. One important reason for the latter development is the eroded financial basis of local public services in the poorer areas, due to the combination of (1) fiscal decentralisation (with local governments being expected to raise their own financial resources), and (2) the transition to the 'household responsibility system' (under which the products of economic activity accrue to households in the first instance, rather than to the collective).

This is not to deny the achievements of the post-reform period in China. The remarkable acceleration of economic growth during that period, and the participatory nature of the growth process, have led to many social achievements of major importance, including a massive reduction in poverty (as measured by conventional income-based measures such as the head-count ratio). In education, health and related fields, however, it is likely that even more could have been achieved had rapid economic growth been combined with a further expansion of public provisioning, rather than substituting for it.¹⁷

II.4 EDUCATIONAL DISPARITIES

A common feature of the literacy situations in China and India is the existence of large disparities in literacy achievements between different sections of population. In both countries, for instance, there are marked differences in educational levels based on gender and residence (rural/urban). The general patterns of educational disparities (including a strong gender bias) are broadly similar in both countries. As noted earlier,

Qinghai	60.0	73.1	45.6	48.5	64.3	31.7	87.2	93.3	80.3
Ningxia	66.5	77.5	54.9	57.2	70.4	43.6	88.3	93.4	82.5
Xinjiang	80.5	84.2	76.5	75.6	79.2	71.7	88.6	92.5	84.4

Note: The 1980 Census distinguishes between three types of residential areas: cities and townships and counties. Urban literacy rates were calculated from the cities and townships data, rural rates from county data. Further, the 1990 Census uses two different notions of cities and townships (see China Population Statistics Yearbook 1992, pp 5 for details); the second notion applies here.

FIGURE 5 INDIAN STATES AND CHINESE PROVINCES LITERACY RATES IN THE 15-19 AGE GROUP, 1981-82

Note: 'C' and 'I' denote the all China and all India figures respectively. Each 'c' denotes one Chinese province ('tb' stands for Tibet). The initials indicate India's major states: AP - Andhra Pradesh, BI - Bihar, HA - Haryana, GU - Gujarat, KA - Karnataka, KE - Kerala, MA - Maharashtra, MP - Madhya Pradesh, OR - Orissa, PU - Punjab, RA - Rajasthan, TN - Tamil Nadu, UP - Uttar Pradesh, WB - West Bengal.

Source: Sharma and Rotherford (1987), SSB (1985) and CASS (1987).

however, these socio-economic disparities tend to be larger in India (see also Figures 1A and 1B).

The ratio of female to male adult literacy in China (in percentage terms) was 78 in 1990, a considerable improvement from the 1982 ratio of 65 (Table 3). This ratio rises steadily with decreasing age, and the ratio for the 15-19 age group was 95 in 1990, suggesting that the elimination of gender bias in literacy among the young is not far off. By contrast, India's female to male literacy ratio was only 53 in 1981, and 61 in 1991. While India's present ratio appears to put it just over a decade behind China with respect to gender bias, the evidence of persistent and strong gender bias amongst younger cohorts in India qualifies this optimistic assessment. The 1981 literacy ratio for the 15-19 age group in India was only 65 - well below China's 1982 ratio of 89 for the same age group.¹⁸

Rural-urban differences represent another crucial basis of social inequality in educational achievements. As mentioned

earlier, residents of rural areas in India experience particularly large disadvantages. In 1981, the rural to urban literacy ratio was just 54, rising only slightly to 61 in 1991. In China, rural-urban disparities are significantly smaller. In 1982, the rural to urban literacy ratio was 76 (much higher than the 1981 Indian ratio), and by 1990 this ratio had risen to 90.

In India, a third important basis of educational inequality is that of caste and related personal characteristics. The 1991 literacy rates for scheduled castes (SC) are much lower than the all-India averages, excluding the scheduled caste and tribe populations (Table 4). SC literacy rates were only 50 per cent for males and 24 per cent for females, compared with 70 per cent and 45 per cent, respectively, for the non SC/ST population.¹⁹ Scheduled tribes are even less literate, with rates of 41 per cent for males and 18 per cent for females. Together, these underprivileged groups make up nearly one quarter of India's total population.

Each of these three major sources of

educational inequality merits attention on its own. Their cumulative effects imply enormous odds against literacy for the most disadvantaged sections of society, particularly in India. To illustrate, while 81 per cent of urban Indian males are literate (96 per cent in Kerala), the corresponding proportion is only 31 per cent for rural females, 19 per cent for scheduled caste rural females, and 5 per cent for the same group in Rajasthan and Bihar.²⁰

The contribution of educational inequalities to the overall India-China contrast in literacy rates can be assessed by noting that for the most privileged group in both countries (i.e. urban males) literacy rates are not all that far apart. In 1990-91, the urban male literacy rate was 91 per cent in China and 81 per cent in India (while the literacy rates for rural females, for instance, was 63 per cent in China and 31 per cent in India). The reduction of educational disparities has played an important role in China's comparatively successful experience of literacy expansion.

Finally, it is worth emphasising that educational inequalities are both a reflection of other social disparities (e.g. those relating to caste, class and gender) and a cause of social inequality. In fact, it can be argued that widespread illiteracy in India is now one of the most fundamental causes of persistent social inequality. Indeed, as mentioned in the introduction, basic education has important liberating and redistributive roles, the suppression of which makes it that much harder to achieve rapid social change. This particular feature of education requires far greater attention than it has received so far, not only from government authorities but also from social movements.

III

Concluding Remarks

A number of significant findings emerge from the preceding investigation. The following are particularly noteworthy.

First, recent census data for both countries indicate that China is well ahead of India in the field of basic education. In 1991, the proportion of illiterate persons in the adult population was still as high as 48 per cent in India, compared with 22 per cent in China.²¹

Second, age-specific literacy rates bring out a crucial feature of the Chinese advantage. While nearly 40 per cent of Indian children fail to learn to read and write, the corresponding figure for China is only around 5 per cent. This implies that China can be expected to move fairly rapidly towards universal literacy as the younger cohorts gradually replace the older age

FIGURE 6A. INDIAN STATES AND CHINESE PROVINCES: ADULT LITERACY RATES, 1981-82

Notes: Same as in Figure 5.

Source: Government of India (1987), SSB (1985) and CASS (1987).

groups. In India, by contrast, there is still a massive problem of illiteracy among young boys and girls.

Third, China's lead was achieved during the pre-reform period on the basis of a strong commitment to the widespread provision of elementary education at an early stage of development. The speed of education expansion in China after Liberation has in fact been quite remarkable. Starting in the 1940s with literacy rates similar to those in India, China almost caught up with Kerala in terms of literacy rates in the younger age groups by the early 1960s, and by the early 1980s China was very close to universal literacy in those age groups. During the 1980s, both India and China made further progress in literacy with their relative position remaining more or less unchanged.

Fourth, aside from having higher average literacy rates, China has been more successful than India in reducing disparities of educational achievements between different social groups. Rural-urban disparities are also significantly lower in China, where infrastructural and institutional expansion in rural areas has

been a major goal of public policy after Liberation.

Fifth, female literacy rates are well below male literacy rates in both countries. The gender bias is particularly striking in India, where 61 per cent of females above the age of seven are illiterate, and where only one girl out of two learns to read and write. The gender gap is rapidly narrowing in China (due to near universal literacy in the younger age groups), but not in India.

Sixth, there are wide inter-regional disparities in literacy rates in both countries. The regional contrasts are largely driven by differences in female literacy. The persistence of high levels of female illiteracy in particular states or provinces is a matter of special concern in both countries.

Seventh, in spite of sharp regional contrasts within each country, most Chinese provinces have much higher literacy rates than most Indian states. The state of Kerala in India stands out as the main exception to this pattern. With universal literacy among adolescent males and females, and near-universal literacy in the adult population, Kerala is not only well ahead of all Indian states but also in the same league as the

most advanced Chinese provinces (in fact, for female literacy, Kerala is ahead of all Chinese provinces). This remarkable achievement reflects more than a 100 years of creative interaction between state commitment to and public demand for the widespread provision of elementary education.³

Likewise, the other striking exception to the general lead of Chinese provinces over Indian states is Tibet. Literacy rates in Tibet are not only abysmally low (even lower than in the educationally backward states of north India), they also show little sign of significant improvement over time. While the interpretation of census data for Tibet requires further scrutiny, there is a strong possibility of Tibet having been comprehensively neglected in the efforts of the Chinese leadership to promote basic education.

IMPLICATIONS

China's lead over India in the field of basic education is one of the pre-reform social achievements that have permitted and sustained participatory growth in China after the reforms. Other achievements of this type, rooted in the pre-reform period, include (1) land reform, (2) the elimination of endemic hunger and morbidity, (3) the establishment of a basic social security system, (4) the expansion of rural infrastructure, and (5) the institution of a credible (though authoritarian) system of local governance.⁴ Understanding these pre-reform achievements is crucial for a correct assessment of China's successful economic development after the reforms, and of the lessons arising from that experience. India is nowhere near achieving the initial conditions that have made the Chinese reforms so successful.

The contrast between India and China in matters of basic education also fits in a general pattern of educational backwardness in India. Literacy rates in India are not only lower than in China (or, for that matter, lower than literacy rates in China in the late 1970s), they are also lower than the average literacy rates for all poor countries other than India and China, and also lower than estimated literacy rates in sub-Saharan Africa.⁵

This sobering aspect of India's development experience calls for radical changes in public policy, giving much greater priority to the widespread and equitable provision of basic education. Admittedly, public awareness of the need to address the problem of endemic illiteracy in India has significantly grown in recent years. Even in official circles, much attention has been paid to this problem. Many pronouncements have been made expressing the government's intention to give basic education a higher priority in

FIGURE 6B. INDIAN STATES AND CHINESE PROVINCES - ADULT LITERACY RATES, 1990-91

public policy, many new programmes have been launched (more often than not in response to international criticism or pressure), and many glossy publications extolling the new initiatives have been produced. But these pious statements are still to be matched with bold measures to ensure the universalisation of primary education in the near future.

2 On the methodology and basic findings of these censuses, see Li (1992) for China, and Bose (1991a, 1991b) and Premi (1991) for India. The issue of comparability between the Chinese and Indian census-based literacy figures will be addressed in the next section

3 Instructions to investigators, 1981 census (see, e.g., *Census of India 1981, Series-1, Part II B(1), Primary Census Abstract, General Population*, p. xiv). The passage cited in the following sentence is from the same source. The literacy criteria used in other recent censuses, including the 1991 census, are the same as those described here for the 1981 census (see, e.g., Government of India, 1992, p. 49)

4 This statement is based on discussions with school teachers (who are often recruited as census investigators) in Andhra Pradesh and Uttar Pradesh.

5 A third issue is that some census investigators may be filling the forms at home, without actually interviewing the respondents (according to one expert from the Indian Statistical Institute, who used to conduct census investigations himself, this practice is not uncommon). If so, census-based literacy figures may partly reflect the subjective perceptions of the investigators, rather than actual literacy achievements. This is likely to lead to large biases in literacy rates for particular villages, but not necessarily for regional aggregates, if the perceptions of investigators are reasonably accurate 'on average'.

6 Useful comparative data on literacy rates from census and National Sample Survey

sources can be found in Visaria et al (1993); see also Sengupta (1991). The official literacy criteria used by the National Sample Survey are similar to those of the census. Literacy estimates based on NSS data tend to be a little higher than the corresponding census estimates, and it has been suggested that this difference reflects the fact that NSS investigators, unlike census investigators, are not required to test the respondents' claimed reading or writing abilities [Sengupta 1991]. Since the actual performance of literacy tests in census investigation is in doubt (as discussed earlier), there may be other reasons for the observed differences between NSS and census estimates. In any case these differences are small and can be ignored for our purposes

7 See, e.g., Zhang and Wei (1987). The same criteria are confirmed by the State Statistical Bureau of the People's Republic of China (personal communication)

8 Personal communication from the State Statistical Bureau of the People's Republic of China. Zhang and Wei (1987:17-18, also state that people "who cannot read a newspaper, write a letter or a receipt" are considered as illiterate or semi-literate

9 See, e.g., the demographic studies of Coale (1993) and Banister (1992a, 1992b)

10 This is, for instance, the age cut off used in both *World Development Report 1994* (World Bank 1994) and *Human Development Report 1994* (United Nations Development Programme 1994)

11 The listing of basic statistics from the four post-liberation censuses (1953, 1964, 1982 and 1992) in the *China Statistical Yearbook 1993* (Table 3.4) does not present any data on education for the 1953 census (while education data are reported for each of the other census years)

12 To illustrate, it is quite possible for country A to have a larger annual growth rate of literacy than country B and yet a smaller rate of decline of illiteracy (an alternative measure of progress)

13 For convenience of presentation, Figure 3 is based on 'forward projection', i.e., predicting literacy rates in later census years from earlier census data. But the principles are exactly the same as with the 'backward projection' method

14 Figure 4 is constructed around age groups for which literacy rates are available for both India and China from the 1981-82 censuses. Unfortunately, the 1981 census publications for India do not give age-specific literacy rates within the 35-59 age group

15 For further discussion of this aspect of Chinese politics, see Dreze and Sen (1995), chapter 4

16 For further discussion, see Dreze and Saran (1995) and Dreze and Sen (1995)

17 In some respects, the progress of social indicators in China during the post-reform period has been surprisingly slow, considering the pace of economic growth in that period. Life expectancy, for instance, has only expanded by 1.6 years between 1981 and 1991, compared with about 2 years in Sri Lanka, four years in South Korea, 4.6 years in Kerala and 5.3 years in India as a whole

FIGURE A1: COMPARISON OF 7+ AND 15+ ADULT LITERACY RATES IN INDIA (1981)

Notes: The all India figure is denoted by 'i', and the initials indicate India's major states.
Source: Government of India (1987).

(see Dreze and Sen 1995, chapter 4) The comparison with Kerala is particularly instructive, given that China and Kerala had very similar demographic indicators in 1981, since then, Kerala has surged ahead of China in this respect, in spite of very slow economic growth

- 18 The ratio of female to male literacy rates is only one possible measure of gender bias, and the comparisons made in this paragraph should be interpreted bearing in mind the 'cardinalisation' issue mentioned earlier (see footnote 10). The general observation that gender bias is particularly pronounced in India is, however, quite robust. Similar remarks apply to the rural-urban comparisons made in the following paragraph.
- 19 All the literacy figures cited in this paragraph relate to the 7+ age group.
- 20 Tyagi (1993), pp 24-30, based on the 1991 census. The reference age group is seven years and above.
- 21 As explained earlier, the gap is even larger when a similar age cut-off of 15 years is used for both countries (as opposed to using the age cut-off of seven years for India, and 15 years for China).
- 22 This statement is inferred from the figures on literacy in the 15-19 age group in 1990-91 (Table 1).
- 23 On this see, e.g. Jeffrey (1992) and Ramachandran (forthcoming).
- 24 The last achievement has been based, to a large extent, on an authoritarian political structure, with the party exercising an extraordinary degree of control over individual lives. This is not a pattern that India would be well advised to emulate, but the Chinese experience does draw attention to the crucial role of effective local governance in economic and social development.

Mental Illness among Indian Women

Bhargavi V Davar

Community surveys, done roughly between the 1970s and the 1990s, provide information on the socio-demographic profile of a mentally ill person in Indian communities. However, these studies do not treat the aspect of gender, nor are there other independent studies on women and mental illness. In order to fill a noticeable lacuna in women's health studies, information about mental illness in Indian women has been obtained from the primary data available from these studies. As gender has been used as a socio-demographic variable in all the studies, it was possible to cull out gender relevant data and re-analyse them from the gender perspective. This work is a secondary analysis

IN the mental health scenario, professional and institutional attention has so far not focused on the mental health needs of Indian women. Planning for mental health in the country, and also, planning for women's health have altogether neglected the question of the mental health of women. In the west, since Phyllis Chesler's (1972) classic work on *Women and Madness*, at least two dozen professional studies and various committee and planning reports, including a recent report (Linderstein et al 1993) of WHO have been published. However, in our own context, we are yet to see a comprehensive academic work in the area, not to mention the complete lack of policy or programme addressing the issue, though scattered material, anecdotal and academic, are available that requires reviewing and analysis.

This paper is one such attempt and tries to provide some information on the occurrence of mental illness among women. Early epidemiological studies in the country, done during the 1970s and the 1980s, give us a picture of the mentally ill in the community. These studies, totalling about a dozen or so, relate mental illness to several socio-demographic variables, such as marriage, education, age, income, etc, so that, in general, the social profile of a mentally ill person may be obtained. These studies, not being gender-specific, gloss over gender differences in the expression of mental illness. That is, even though the studies provide a general idea about the socio-demographic characteristics of the mentally ill in the community, they do not give information about gender differences in the expression, prevalence, cause or course of mental illness.

Gender has been used as a variable in many of these studies. Therefore it was possible to approach these studies from the perspective of gender, culling out gender-relevant information from them, and making independent associations with the other variables, such as marriage, age and education. This approach, being a secondary analysis, has obvious limitations, such as discrepancies in methodology, the diagnostic categories used, the varying cultural contexts of the different studies, etc. However, I have

adopted criteria that will overcome at least some of these problems. For example, only those studies with comparable methodologies and diagnostic categories have been used. It has been assumed that the different studies from different parts of the country are representative and will give an approximate, if not accurate, picture of a mentally ill woman in our culture. From this analysis, it has been possible to obtain information about mental illness among women and respond to important questions such as the frequency of prevalence of mental illness among women and their proneness to certain types of disorders. I have been able, to a limited extent, to associate the occurrence of mental illness in women with other socio-demographic variables such as marital status, age, education, work, etc.

GENDER IN HOSPITAL AND EPIDEMIOLOGICAL STUDIES

Some of the studies, such as those by Brij Mohan (1970), Sethi et al (1978), Bhattacharya and Vyas (1969), Weismann and Klerman (1977), all record a male preponderance of psychiatric disorders, particularly depression. Bhattacharya and Vyas observed an equal number of male and female depressives in their sample. Weismann and Klerman also noted a greater prevalence of mental illness among men. This trend is not in keeping with studies from the west, where, it has been noted especially in the case of depressive disorders that "women predominate in all countries and all time periods" [Guttentag 1980:73].

It is noteworthy that the above studies have been based on hospital samples and not community samples. These studies have used data on utility as if they were prevalence data, which is highly questionable, especially in the Indian context. In the west, there is parity of access to health care by both the sexes, and so there is some justification in subjecting hospital based samples to prevalence analysis. Comparisons of community survey rates of mental illness and hospital rates do not grossly differ in the western context. But, in our country, there is gross

gender based inequity of access especially to hospital care and so, making any conclusion about the comparative prevalence of mental illness in the two sexes based upon utility data gathered from hospital samples is both methodologically questionable and politically misleading.

Such a methodologically dubious conclusion is politically misleading for the following reason: The naive explanation some of the above studies offer for the supposedly greater prevalence of mental illness among men is that it is men who carry the burden of responsibility in a patriarchal system, with other family members, such as women, contributing very little. Sethi (1978), for example, explains the greater frequency of illness among men in his study by noting that "the obligation and responsibilities that a male must fulfil are full of challenge and stress" (p 204). Venkoba Rao observes "the patriarchal system of the population may possibly explain" the male preponderance in his sample of depressives. By making this assumption, these studies altogether ignore crucial issues women's movements have been raising such as, the unequal decision-making power, unequal work distribution, work overload, unpaid labour, rigid role functions and stereotyping, all of which are dehumanising and stressful for women. These studies thereby provide a facile and easy explanation for the greater prevalence of mental illness among men, showing a distinct gender bias in their supposedly professional perspective.

It is not the case that the point about inequity of access to health care by both the sexes have altogether escaped some of these authors. Sethi (1978), for example, writes, "While it has been reported that a higher percentage of male population registered at psychiatric facilities in India, it is by no means indicative of a higher morbidity in males. Lack of education, superstitions and reluctance on the part of the womenfolk and the social stigma and bleak chances of matrimonial placement in our culture are significant determinants" (p 206). But, even in this caveat that the author adds, we see the responsibility for being mentally well

and seeking mental health care is somehow thrust upon the woman. The author clearly implies that if women do not seek mental health care, it is because of their "lack of education, superstitions and reluctance", whereas the social reality of most women is that decision-making about her own health needs rarely rests with her.

As all these studies are based on hospital data, they have not been considered in the analyses of the prevalence of mental illness in women. Instead, we turn our attention to the available community surveys.

Epidemiological studies show the prevalence rates of mental disorders in the community to vary from between 23.79 [Dube 1970] per thousand and 129 per thousand [Chakraborty 1990]. A perfunctory note of explanation is invariably appended to each of these studies, citing the cultural, demographic, methodological and diagnostic variance of the studies. Rural and urban samples show variance, some studies include all kinds of disorders, such as suicide, psychopathy, alcoholism, drug addiction, speech and behaviour disorders of children, etc, while others do not; criteria of inclusion or 'caseness' varies from study to study, depending on the diagnostic tools used and the method adopted for case-identification. With an almost audible sigh of helplessness in deciding how useful these data are and how exactly one must treat them, it is now understood that mental illness in the community is of the order of 11 per cent, of which 3 per cent require "active rehabilitation" and 1 per cent require hospitalisation. Table 1 shows different studies in the country since 1970, and the prevalence data that they provide.

Some studies, such as by Sethi (1974) and Thacore (1975) do not show any significant correlations between gender and prevalence. Indeed, in their data presentation, they have not disaggregated for gender, simply noting a lack of significance between mental illness and gender. Both these studies include alcoholism. Sethi's study includes childhood disorders whereas Thacore's study includes personality disorders, social maladjustment and suicide. The ICMR and DST sponsored (1987) study on severe mental morbidity also did not show any significant relation between prevalence of illness and gender. This study focussed only on the severe mental disorders.

Other studies, such as Shah (1980), Nandi (1975), Dube (1970), Verghese (1973), Issac and Kapur (1986), Carstairs and Kapur (1976), Chakraborty (1990), show that mental illness is more common among women. Nandi's study which includes enuresis and addiction, shows no overall significant difference in prevalence of illness between men and women. However,

disaggregated data shows considerable difference in prevalence between genders with respect to both diagnostic category and age. All studies, except Issac and Kapur (1986) and Carstairs and Kapur (1976) exclude alcoholism and personality disorders. These latter two studies show greater female morbidity despite including alcoholism.

The factors which contributed to a lack of significance between gender and illness in some studies are the diagnostic criteria. Studies which have included personality disorders and alcoholism consistently show lack of significance. Studies which have included alcoholism alone have not made an overall impact on the relation between gender and illness.

Table 2 presents the disaggregated rates of prevalence of mental disorders for men and women in India. Prevalence among men is around 11 per cent and among women, about 15 per cent. This has been arrived at by averaging out the data presented in all these studies. Only those studies have been included which have presented disaggregated data on gender. All these studies give only point prevalence of illness and not rates of incidence.

Using a similar method and comparable diagnostic categories, Goldberg and Huxley (1992) compute from various community surveys in the west, that the rate of prevalence for women is around 202 per thousand or around 20 per cent; for men, their analysis showed a rate of about 12 per cent. It is

widely noted that the prevalence rates of mental illness in the west is much higher than that in the developing countries. But higher prevalence of mental illness in women is a global phenomenon.

My inference that there are more mentally ill women than men must be further qualified. As noted earlier, most studies which show female preponderance have also excluded typically male disorders such as alcoholism, drug addiction and personality disorders. There is a debate about the inclusion of these under the category of mental illness, though all diagnostic manuals do include them. These are considered to be deviances rather than disorders. Personality disorders are argued to be not really disorders, amenable to therapeutic change but rather enduring traits or profile of a person who is socially deviant. Goldberg and Huxley (1992) while writing on the 'common mental disorders' note that they will not include personality disorders because "these are ways of describing people who differ from the majority in a stable way - except in fairly rare circumstances, one does not usually suddenly develop a personality disorder; and, once one is present, it is unlikely to go away" (p 8). However, if one were to take the opposite view in this debate, it may turn out that inclusion of these disorders would show a different distribution of prevalence of illness in the two sexes. But this needs further corroboration through research, because, most of the studies have excluded these disorders.

TABLE 1 PREVALENCE OF MENTAL ILLNESS IN COMMUNITY RATE/THOUSAND

Source Study	Place of Study	General Prevalence	Prevalence		Remarks
			Male	Female	
Dube, K C (1970)	UP Urban	23.8	15.7	33.3	Excludes alcoholism, personality disorders
Verghese, A (1973)	Vellore Urban	66.5	60.4	72.9	Includes alcoholism, personality disorders, drug addiction
Sethi, B B (1972)	Lucknow Rural	39.4	52.5	24	Includes alcoholism, personality disorders
Sethi, B B (1974)	Lucknow Urban	67	-	-	Includes alcoholism, personality disorders
Nandi, D N (1975)	W Bengal Rural	102.8	90.6	114.6	Excludes alcoholism, personality disorders, Includes addiction
Thacore, V R (1975)	Lucknow Sub-urban	82	85	78	Includes alcoholism, personality disorders
Shah, A V (1980)	Ahmedabad Urban	47.2	39	56	Excludes alcoholism, personality disorders
Chakraborty, A (1990)	Calcutta Urban	129	92	225	Includes personality disorders
Carstairs, and Kapur (1976)	Kota Rural	370	320	400	Includes alcoholism
Issac and Kapur (1986)	Rural	161	94	228	Includes alcoholism
Total		109	94.35	147	

COMMON MENTAL DISORDERS

Next, I address the question whether women are prone to certain types of disorders. I do this by categorising mental illnesses into the 'severe' type and the 'common' type, an established distinction in literature. Disorders such as schizophrenia, depressive psychoses, mania, epilepsy, mental retardation, and organic brain disorders are usually treated as severe mental disorders. Neurotic disorders, major depression, hysterias, obsessive-compulsive disorders, anxieties and phobias, somatisation disorders are classified as being common mental disorders. The clinical picture between these two categories of disorders varies remarkably. The degree of cognitive, personal and social impairment is very high in the case of the severe mental disorders. In the case of the common mental disorders, even though personal distress may be very high, there is no complete cognitive breakdown. Often manifestation of illness is physical, such as in hysteria and somatisation disorder. Usually social functioning is seriously impaired, and family discord and maladaptive family interactions may be common.

It is important to note that calling a class of disorders as 'common mental disorders' does not necessarily imply that they are mild or that they cause very little personal suffering. They can cause enormous suffering, including chronicity. They often cause irreparable social alienation, loss and damage.

Some important implications follow for the gender perspective from this distinction. This distinction has profoundly influenced the mental health programme in the country, with a distinct bias of policy being in favour of the severe mental disorders. It is well known that the common mental disorders are more frequent in the community and that the percentage of population being severely ill is only 1 per cent. The alleged justification is that the severely mentally ill suffer more, but this is questionable if 'suffering' is understood to include the social aspects of mental illness also. This is particularly pertinent in the case of women where psycho-social distress is very high, sometimes high enough to lead to social isolation, violence and self-destruction. This suffering cannot be measured, evaluated nor treated with the same clinical standards of the severe mental disorders. In another paper [Davar forthcoming] I have argued that the national mental health policy is based on cost-effectiveness rather than on community need in its prioritisation of the severe mental disorders. I have noted here that the policy, even though it is hailed as a landmark in the health policy of the country, ignores fundamental issues in mental illness and its

treatment, such as the medicalisation of mental illness, particularly in the context of women's mental health.

Table 3 presents data collated from the different epidemiological studies on the prevalence of different mental illnesses in the male and the female populations. I have classed data pertinent to psychoses, organic brain syndrome and epilepsy as belonging to the category of severe mental disorders and all neuroses as belonging to the class of the common mental disorders. I have used only those studies which have presented disaggregated data on gender and prevalence of psychotic and neurotic disorders. As is evident from the table, almost all the studies show that there is no significant difference between the two sexes on the prevalence of the severe mental disorders. Nandi's (1975) study found no significant difference in the prevalence of psychotic depression, but found significantly greater number of women afflicted by epilepsy. But this finding is peculiar to this study and is not corroborated by other studies. Chakraborty (1990) finds greater psychotic illnesses among women. Only in the personality disorder group, male preponderance is seen. Carstairs and Kapur (1976) on the other hand note a greater prevalence of psychotic symptoms among men. However, the overall gender difference is not significant. This is true of mental retardation also, where prevalence is distributed almost equally between males and females.

But the picture changes dramatically with respect to neurosis. All studies invariably show that psychoneuroses is significantly more common among women, with most studies noting at least a 1.2 ratio in the frequency of its occurrence between males and females respectively. The overall gender based difference in prevalence of the psychotic disorders is negligible, compared to the overall difference in the prevalence of the neurotic disorders. Even those studies which did not find an overall significant difference of prevalence of illness in the two sexes, such as Sethi (1974), Nandi (1975), Thacore (1975), and Sethi (1972), which found overall male preponderance of illness, note a very high frequency of occurrence of neurotic illnesses in women.

Special studies on depression give us a better idea about the prevalence of the illness among women than that obtained from the community surveys. Sethi and Rudraprakash (1979) found a higher prevalence of depression among women, the frequency of occurrence being almost double that of the males in a community based sample. The greater susceptibility of women to this disorder has been recorded the world over. Singh (1968), Ponnudurai (1981) and Bagadia (1973) all found a very

high occurrence of hysteria among women. The male-female ratio of frequency of illness of hysteria is 1.3. Dube (1970) too found an excessive representation of hysteria among women. Issac and Kapur (1986) found a 1.4 ratio between men and women in the frequency of occurrence of hysteria.

Gender difference in the rates of suicides cannot be conclusively stated. Studies in Bengal [Banerjee 1990, Nandi 1979] particularly found a preponderance of woman suicides consistently over the last 100 years. Other studies, such as by Ponnudurai and Jayakar (1980), have also reported higher incidence of suicides in females. It has been noted that "female suicide due to harassment, dowry problems and other problems related to her family roles is high in India" [Mane 1993:137]. However, studies from other parts of the country do not show gender difference, and many of them note a male preponderance. So, as far as prevalence of suicide is concerned, no gender relevant pattern emerges from these studies.

But in terms of the profile of suicides, gender differences may be noted. Kodandaram's (1983) study notes that more women than men complete the act of suicide. In this study, it is the younger women who more often commit suicide, and among these, attempted suicides are more among the unmarried, while completed suicides were more among the married. In Kodandaram's

Total	13.10	11.50	68.0	103.50

sample of women suicides, 71.23 per cent of completed suicides and 90 per cent of attempted suicides were below the age of 30 years. The highest incidence of suicides are among housewives. Venkoba Rao (1989) had reported that of his sample of 100 cases of female burns, 70 per cent were suicidal and 74 per cent were married. Major problems reported by these women were having an alcoholic husband, wife beating, extra-marital relations and 'adjustment' problems with the husband. This study, like others, found the highest number of suicides among young, married women. It appears that financial problems, economic deprivation, and quarrel with parents lie at the root of suicides among males, whereas family discord, violence and harassment are more commonly associated with female suicides.

Recently, Agarwal (1989) in his editorial on 'Law on Bride Burning' writes, "Suicidal thoughts as well as depression are common due to adjustment problems amongst a large number of young brides. Also many psychiatric illnesses especially schizophrenia are likely to be precipitated during early years of marriage" (p 1). Agarwal's message is that bride burning is not as important a problem as suicide among young married women and that law should focus more on the latter rather than on the former. Other than the questionable politics of the use of the dubious concept of 'adjustment' here, Agarwal underestimates the gravity of the problem of bride burning. His stance is provocative, especially in the context of the reality that most cases of bride burning tend to be reported as cases of depression and subsequent suicide. The simplest way of masking a case of bride burning has been to claim that the woman had 'adjustment' problems with the husband's family, was depressed and suicidal. This view has social sanction and no legal hassles are involved in reporting death due to depression and suicide. And, reporting bride burning as depression shifts culpability from the harassers to the victim, for, until very recently, suicide was a punishable offence. The point is that women's groups and other professional groups need not underestimate either the bride burning problem or the problem of suicide among young married women, as Agarwal seems to assume. Both are important requiring research, social consciousness and reform.

A neurotic disorder very common among women is somatisation disorder, where, bodily complaints such as aches and pains, headaches, dizziness, etc, have no discernible physical basis. This disorder must be distinguished from psycho-somatic illnesses, where, there is a physical component of the problem along with associated psychological complaints. Chadda et al (1990) found high

prevalence of this disorder among women. But his sample was hospital based, and does not probably reflect true prevalence in the community. Issac and Kapur (1986), Carstairs and Kapur (1976), Chakraborty (1990), all found greater numbers of somatisers among women in their community surveys.

Table 4 shows the relative occurrence of neurotic disorders among women from data available in the different studies. Approximately up to 75 per cent of a population of disturbed women will very likely be suffering from neurotic disorders. If we take it that 15 per cent of women in the community suffer from mental illnesses at any point of time, then up to 11 per cent of women in a community are likely to be suffering from the common mental disorders.

There is the doubt often expressed whether the reported greater prevalence of mental illness among women is not because of greater reporting of illness by women. This point of view has been put forward in the west, and it has been found that women remember their symptoms and are more willing to acknowledge their illness, whereas men forget their symptoms [Goldberg and Huxley 1992:19]. An early review by Guttentag et al (1980) as well as the Linderstein et al report (1993) noted that women reported more distress, but they concluded that this was because they were also more frequently ill. Studies show that there is a positive correlation between stressful life events and symptom intensity in depressed patients. Women do not necessarily experience greater life events than men and they rate stress equally objectively. There is commensurability between distress and the reported severity of symptom. This is true in the western as well as the Indian contexts, as Mahatme's (1989) study shows. The prevalence rates of hospital samples and that obtained from community surveys are approximately the same in the west. All these reflections show "The female predominance of depression is therefore not an artefact of treatment seeking" [Linderstein et al 1993:9].

In the west, treatment seeking patterns differ markedly from that in India. All treatment settings show an overwhelming majority of women clients in the west, the ratio between men and women sometimes reaching as much as 1:3. Therefore, it was justified to wonder whether women were reporting more illness than men. But even in the west this 'reporting syndrome' among women has been questioned and seen as a typically male bias, used to undervalue women's suffering. However, in the Indian context, treatment pattern is the reverse of that obtained in the west. Women have very negligible access to mental health care and

the only setting where there is gender parity in access to health care is the community setting. In India, men are reporting more illness than women, unlike the west, so the question whether the illness rates in women is an artefact of reporting is an irrelevant one. Our Indian reality is that both men and women report less at the different psychiatric facilities, compared to the actual prevalence of mental illness in the community; and further the number of women reporting illness at any of these facilities is much less compared to men.

PSYCHO-SOCIAL MODEL

I have so far made two inferences, one, that women are more frequently ill than men; and secondly, that women predominate in the common mental illness category, where as prevalence of illness is homogeneous across gender in the severe mental illness category. It is appropriate to now consider the issue of choosing the model that best explains the greater prevalence of common, specifically neurotic and depressive illnesses among women. Earlier, in the history of psychiatry, there was the belief that illnesses could be understood in biological terms. But this belief has proved to be more or less illusory. Current perspectives on mental illness prefer a bio-psycho-social model of causation of mental illness. Different types of illnesses may be conceived of as lying at different points on this multi-axial model. Different combinations of biological, psychological and social factors contribute towards the causation of different illnesses. To simplify matters, we might imagine mental illnesses on a straight line, with a strong biological aetiology limiting one end and a strongly psycho-social aetiology limiting the other end of the line.

It is interesting that the severe mental disorders, which show no gender difference in terms of prevalence of illness, lend themselves more towards a bio-genetic interpretation of illness, whereas the common mental disorders, which are more common among women, are explained better on psycho-social terms. Disorders such as

TABLE 4: PREVALENCE OF PSYCHOSES AND NEUROSES AMONG WOMEN
(Percentage)

Source Study	Psychoses+ Other Organic Disorders	Neuroses	Total
Dube, K C (1970)	31.41	68.59	100
Sethi, B B (1972)	63.30	36.70	100
Nandi, D N (1975)	56.45	43.55	100
Carstairs and Kapur (1976)	5.91	94.91	100
Chakraborty, A (1990)	10.00	90.00	100
Total	33.41	66.59	100

schizophrenia, pure states of anxiety, MR, organic brain disorders, manic types of depression and some types of psychoses show strongly bio-genetic modes of transmission. This is not to say that social factors are not involved at all in the course of treatment of these illnesses, but only that they are not invoked in explaining the cause of the illnesses.

Gender difference in severe mental disorders was until recently unresearched, but recent studies show that in terms of age of onset, the role of social support, illness expression, precipitating factors and outcome of illness, there are definite gender related differences. In schizophrenia, for example, onset of illness happens earlier in men than in women [Lewis 1992; Thara and Rajkumar 1992]. Women show positive symptoms, such as depression and dysphoria, whereas men show negative symptoms, such as social withdrawal, substance abuse and anti-social behaviour. Women seem to have a better treatment outcome than men. Rehospitalisation for relapse was more common among men than women, though, gender effects of readmissions became diluted after two years of follow-up. Suicide and loss of social and economic status was more common among men than women, according to Thara and Rajkumar's study. Men often show more brain structural abnormalities leading to schizophrenia than women. Lewis notes, "On a range of measures there is now good evidence that antecedent deficits are more common and more severe in boys going on to develop schizophrenia than in girls" (p 446). Life events heralding onset of illness were more common among women.

However, social support and psycho-social factors do not play a major role in the aetiology of psychotic and other severe mental illnesses. Even though animal, genetic and bio-chemical studies have been carried on in the case of many forms of mental illnesses, especially schizophrenia, different forms of depression and anxiety, evidence in favour of a bio-genetic model has come only for the severe forms of mental illnesses. Goldberg and Huxley, after reviewing work in bio-genetic studies in the area of depression, note "Although there is good evidence for genetic factors being important for severe forms of depression like manic-depressive illness, for the common forms of depressive illness it is difficult to show that genes have more than a non-specific effect in making disorder more likely" (1992:83).

Common illnesses, especially neuroses, major depression, somatisation disorders and hysterias, which are frequent among women, are better explained using a psycho-social model of mental illness. There is growing literature about the frequent recurrence of

common, especially neurotic illnesses, in families with no evidence of genetic transmission. These illnesses are caused sometimes by a family's peculiar, often dysfunctional ways of interacting. Sharma et al's (1980) study on neurotic disorders in children noted that illness in the child, especially hysteria, which is common among women, closely resembled illness in the mother. The authors suggest that "... family factors play an important role in the development of childhood neuroses" [Sharma et al 1980 365]. Rutter (1985) noted that family discord, especially when the hostility directly involves a child in the family, causes a range of emotional and conduct disorders in adult life. Especially in the case of neurotic depression and peripartur depression, common among women, the depressives consistently reported over-protective and less caring mothers, implicating the role of rigid sex-typing techniques in the aetiology of mental illness. 'Affectionless control' [Parker 1983] is often cited as an important cause of the common depressive disorders. It is easy to speculate that this explanation of depressive illness is pertinent to our own culture, where rigid parenting and sex-stereotyping is the dominant model of socialisation of children [Malhotra and Malhotra 1985].

The psycho-social origins of common mental disorders, especially depression in women has been extensively studied in the west. It is unfortunate that there is no available study in our own context comparable to Brown and Harris' elaborate studies on the social origins of depression (1978). It is difficult to review this entire literature within the scope of this paper and indeed, unnecessary to do so. The upshot of the discussion so far is simply that women seem to be more prone to those disorders which have a psycho-social origin rather than a bio-genetic origin. It is telling that where aetiology is strongly bio-genetic, no gender difference is seen in the prevalence of illness; whereas, those disorders with a strong psycho-social origin show a gross difference. Therefore, gender difference in the prevalence of mental illness is to be explained

psycho-socially rather than bio-genetically. A purely bio-genetic model of explanation of mental illness in women will be inadequate, as it will altogether ignore the issues related to the social status of women, the psycho-social stressors associated with their status, the social effects of their illness in their relationships, and a vast number of other important issues which are of equal social consequence as they are of clinical consequence.

Table 5 shows the total psychiatric disturbance of women grouped according to their developmental stages: childhood (up to 14 years); reproductive years (between 14-40 years); menopausal (between 40-49 years); and finally, old age (beyond 50 years). It must be cautioned that this grouping is a re-classified, qualitative one and does not conform to the agewise grouping of data in the primary studies. This re-grouping of data had to be adopted because the studies did not all always conform to a standard age-grouping. Also, this qualitative re-grouping threw up some telling patterns of occurrence of illness, in terms of developmental stages of a woman's life. This approach also made it possible to expose certain pseudo-explanations commonly offered by professionals for the greater prevalence of mental disorders among women, notably, 'the menopausal theory of mental illness', which I shall attend to below. It seemed more significant therefore to re-group the data qualitatively rather than retain the original quantitative grouping.

It was sometimes difficult to fit the agewise grouping of data from the primary studies into this qualitative grouping. I have had to make some intuitive choices about the inclusion of certain age groups in the studies under particular developmental descriptors. Thus, for example, in Nandi's (1975) study, women between 12 and 14 years have also been included in the 'reproductive years', as these years fall within the age class 12-35 of his study. In the same study, the 36-47 class has been included in the 'menopausal years', even though the years 36-40 would still be reproductive from the qualitative classification.

TABLE 5: AGE AND PREVALENCE OF MENTAL ILLNESS IN WOMEN

Source Study	Childhood	Reproductive Years	Menopause	Old Age	Total
Dube, K C (1970)	18.04	66.37	9.13	6.46	100
Nandi, D N (1975)	11.30	50.00	20.96	17.74	100
Chakraborty, A (1990)	-	67.70	13.70	18.50	100
Total	9.78	61.39	14.60	14.23	100
<i>Neuroses</i>					
Dube, K C (1970)	6.17	79.22	9.74	4.87	100
Ponnudurai, R (1970)	19.50	80.50	-	-	100
Kodandaram (1984)	34.64	52.43	7.42	5.51	100
Total	20.10	70.72	5.72	3.46	100

From the table, it is evident that the prevalence of mental illness is phenomenally high during the reproductive years. The menopausal years and beyond 50 years do not show very high prevalence in comparison to the reproductive years. Prevalence of mental illness in women increases to steep levels after childhood until the age of about 40 and falls off steeply during the menopausal years and later. This trend is consistent in all the studies noted, and especially so for the common mental disorders. The difference in age-wise occurrence of illness is not so graphic in the case of prevalence of all disorders as it is in the case of neurotic disorders, as is evident from the data presented by Dube (1970) and Chakraborty (1990) on neuroses, and Ponnudurai (1973) on hysteria.

Dube's sample of women showed that 79.2 per cent of neurotic illness occurred in the 15-34 age group. Chakraborty's sample showed that 53.6 per cent of mental illness occurred in the 14-39 age group. In Ponnudurai's sample 80.4 per cent of hysteria belonged to the 16-35 age group. Suicides are also highest in the 21-40 age group. Kodandaram's (1983) study on suicide could not be appropriately represented in the table, because the lowest age-class in his study was 'below 20', and hence this had to be included in the childhood group. Therefore, in this study, only 52 per cent of total suicides and 54 per cent of completed suicides fall between the 21-40 years group, which is in itself high enough. But I suspect that some cases which could have been legitimately included in the class of reproductive years has now been lost to this group and has gone under the childhood group. This explains the fact that the 'childhood' group in Kodandaram's study shows 35 per cent of total suicides and 31 per cent of completed suicides. This gives us a distorted picture of high rates of suicides among girl children.

Though Verghese (1973) found no overall difference in the prevalence of illness between the two genders, he did find a significant age-related gender difference. He writes, "Our study show that women are more prone to get psychiatric disturbance both psychoneurotic and nonpsychoneurotic during the 31-45 years period" (p. 616). Nandi (1975) notes, "... males and females, according to their age-groups, show remarkable difference in their rate of morbidity. Females show a galloping rise in their rate of morbidity till the age of 36-47 years and then it drops appreciably in the higher age-groups. But males show a gradual rise in the rate of morbidity with a slight drop in the 24-35 years age group till the age of 36-47 years and then it sharply shoots up in the higher age-groups" (p. 95).

In explaining the greater prevalence of mental illness in women, Verghese (1973) writes, "This vulnerability of women to have psychiatric disturbance is difficult to explain. The social stresses of women and the factors associated with the menopause may contribute to this vulnerability" (p. 616). Shah et al (1980) notes that the greater prevalence of mental illness "is positively linked with universal phenomena of physiological and psychological changes occurring in females after menopause, making them more vulnerable..." (p. 387).

The connection posed between menopause and greater mental illness in women needs to be thoroughly questioned. That this view is permeated by myths is documented in recent reviews of literature [Mathews 1992]. The Linderstein et al (1993) review also showed that any increase in rates of depression in menopausal women is not explained by hormonal changes occurring at menopause. Mid-life changes, such as physical problems, loss of spouse, change in career options, and other psycho-social stressors are related to illness rather than menopause *per se*, though hysterectomies and other gynaecological problems associated with menopause might create distress. From our own data, it is very evident that morbidity rates in women fall off after 40 years or so, thereby throwing serious doubt on the 'menopausal' theory of mental illness in women.

Causal attributions of mental illness to women's progenerative capacity is not a new phenomenon. There was a time in America as recent as the 1870s when insanity was commonly 'cured' by performing bilateral ovariectomies [Grob 1983: 122-23]. To grasp at cliched and socio-culturally metaphorised pseudo-explanations is to be relieved of a deeper commitment to scientific objectivity and to social change. Once it is stated with professional authority that women's mental

illness is caused by her sex hormones, further critical inquiry is rendered unnecessary. This casualness, this strange urge to link all disorders to woman's reproductive system that is so prevalent in health studies reflects only the unconscious fear that the system, with its present male-contracted power equations, might change with new knowledge.

Table 6 shows the variance of mental illness with respect to marital status. Carstairs and Kapur's (1976) study at Kota did not find any significant relation between marital status and case rate. Nandi (1975), Sethi (1972, 1974) and Thacore (1975) have not presented disaggregated data on gender and marital status. In these studies, except Sethi (1972), it is evident that in general, being married is more stressful than being single. Sethi (1972) shows a greater frequency of illness in the 'single' category only because 67 per cent of the disturbed population belong to the 0-10 years age-group and MR was over-represented in the sample. All these studies, except Sethi (1972) also show that being widowed, separated or divorced is the most vulnerable group for mental illness.

All other studies [Dube 1970; Verghese 1973; Chakraborty 1990] consistently show higher frequency of illness in married women as compared to married men, and greater frequency of illness in single women as compared to single men. That is, in all categories related to marital status, women are more stressed than men. Married women are more prone to illness than single women, though divorced/separated/widowed women show the highest frequency of illness. In the west, contrary to our own experience, divorced and widowed women show lower rates of mental illness than married women, on par with single women. No conclusions may be drawn about the frequency of illness in men with respect to their marital status from these studies alone, though divorcees

and widowers show very high rates of illness.

No studies are available in our context to inform us as to why stress is very high among the divorced/separated/widowed women in our culture. But one may speculate that this might have to do with the cultural imperative that a family is complete only when headed by a male. Also, a woman who has not been allowed the minimal skills of manipulating her world and resources would now find it extremely difficult to fend for herself. She would also have difficulty finding employment and her choice of employment would again be limited by various factors, such as her age, experience, etc. It is well documented that women-heading households show greater frequency of mental illness. Another factor associated with stress among widowed women could also be the loss due to the bereavement itself, as the emotional investment by women in the marriage and family is very high in our culture. In the case of divorced or separated women, high frequency of illness could be because of the stressors associated with the earlier marriage particularly problems relating to dowry harassment, domestic violence, alcoholism and extra-marital relations, which are very common in relationships. A separated or divorced woman is also socially stigmatised, frequently has to bear economic responsibility, and often has to put up with unsolicited sexual advances because she is seen as 'available'. These reflections, it must be cautioned, are not offered as explanations, but only as possible hypotheses, which require further study.

What is surprising about the data is not that divorcees and widows are highly stressed, but rather that married women are equally highly stressed. All the surveys show that among the occupational groups, housewives figure at the top of the list showing the highest prevalence of illness, comparable only to unskilled labour and unemployed persons. Suicide rates are also the highest among housewives: single women do not as often complete suicides as married women. Dube's (1970) classic paper noted very high frequency of illness among those involved in 'household affairs', presumably a majority of them being housewives. Chakraborty's (1990:123-26) detailed analysis throws more light on the impact of household occupation on the mental well-being of individuals. Importantly, her study showed that females were more affected by household work than males. Women are often bound to the culturally compelling image of blissful marriages and the comparative existential sterility of being single. Data suggests otherwise. In this case of the widespread saleability of marriage as the single most beneficial option for women, we are dealing with another cultural myth

that begs deconstruction from the mental health angle.

As to the possible stressors associated with marriage, one is again compelled to make intelligent guesses, for there is no comprehensive research in the Indian context. The western studies show that certain social factors, such as long-term social adversity, role-overload, having more than three young children, loss of parent before 11 years of age, long-term breast feeding, lack of intimacy with the husband, and stressors related to pregnancy and childbirth, migration and social change, among other factors, can cause psychiatric disturbance, specifically depression, in women. In our own context, we can extrapolate the causes of illness from these studies, though, with caveats, for the cultural difference must surely introduce significant modifications in the explanation of illness. For example, in the western context, lack of intimacy with the husband might mean the conflicts arising out of disengaged ways of conjugal relationships in which the spouses fight to retain their separate individual identities. In our own context, however, lack of intimacy with the husband would mean just the opposite, where conjugal relationships are matrixed so intimately within tightly bound kinship structures of family life that intimate interaction between the spouses is minimised, and often discouraged. It is also doubtful whether factors such as 'long-term breast feeding' will be stressful for the Indian woman.

To explain the greater frequency of illness among married women, we need programmatic research in the area. Sociological studies do provide some idea about the stresses of socialisation of women in different cultures, however, these studies are by and large speculative and theoretical. Clinical work in family and marital therapy is also a well-established tradition in the country, but the question remains as to whether clinical experience can validate specific empirical hypotheses. Well designed empirically bound studies relating marriage with mental illness must be pursued, to identify the stress points of marital relationships.

Violence against women, especially childhood sexual abuse, wife beating and rape have pathological sequelae. Women respond to domestic violence by becoming depressed or committing suicide. The most frequently observed disorder in the case of rape victims is post-traumatic stress disorder (PTSD). Hysteria and somatisation disorder might well have to do with childhood sexual abuse. Recent writers on the subject stress that general practitioners must inquire into this aspect, especially in the case of chronic pelvic pain which is unmitigated by medication.

Other associations thrown up by this analysis are with respect to work, education and economic status. It is difficult to assess the relationship between women, work and mental health in the Indian context, for Chakraborty's study (1990) is the only one to have addressed it specifically. This study shows that women in the low and middle level occupations are more stressed than their male counterparts, whereas, in high level occupations, the reverse trend is seen. Women in the unclassified categories of workforce, such as beggars, prostitutes and household maids show the highest prevalence of mental illness. We must question here another myth that pervades the country's health policy, that the issue of mental health concerns only the affluent elite and requires attention only after the physical determinants of health are fully satisfied. All studies show that mental illness is high among the lower economic classes. Education seems to have a positive effect on mental well-being, the impact being more on women than on men.

The epidemiological studies also present other data, such as the correlation between illness and family structure (extended/nuclear), illness and place (urban/rural/semi-urban/rural). However, treating this data to a secondary analysis is highly problematic methodologically as well as contentwise, and I have not been able to consolidate a perspective on these aspects from these studies.

Summarising, we might say that if one is a woman, in her reproductive years, divorced, married, widowed or separated, is a housewife, in low or middle level occupations, in unpaid jobs, or illiterate, she is high risk for mental illness. I need only repeat that around 15 per cent of women in the community may be suffering from mental illness. The issue is proximal to every woman's life.

It has to be emphasised again that my study is a secondary analysis, and cannot be treated as a substitute for full-fledged empirical work. The studies are gender-blind in their design, and this has probably influenced the questionnaire used for interviewing and the processed results. The diagnostic manuals used in many of the studies, such as the ICD (1965), have gone through several changes, including becoming gender sensitised. The studies date as far back as the 1970s, when social organisation was possibly different. In view of the present political realities and rapid social changes, which have major consequences for the status of women, further research is necessary. I have had the occasion to point out several myths, obfuscations and lacunae in our present understanding of women and mental illness in the Indian context. These lacunae are not

of the nature of detailing or fine-tuning existing research, but rather, of starting entire research programmes. The area of women and mental health needs immediate attention from health researchers, social scientists, women's organisations, professional organisations, health planners and other administrators.

[This paper is based on a report I recently prepared for Anveshi, Research Centre for Women's Studies, Hyderabad, on 'Women in India and Their Mental Health'. I thank friends from Anveshi, especially Veena Shatrughna and Lalitha, for the personal and financial support I have received for this work. I am also grateful to Srinivasa Murthy from NIMHANS for his enduring encouragement and unstinted sharing of information during the course of this work. The responsibility for the views expressed, however, is solely mine.]

NEW BOOK FROM

MD

PUBLISHERS OF THE
HUMANITIES, NATURAL
& SOCIAL SCIENCE

WOMEN IN AGRICULTURE Perspective, Issues and Experiences Edited by R K Samanta

1995, 218p, ref, tables; 22x14cm
ISBN 81-85880-86-7

Rs. 300.00

The book covers relevant issues on women in farming and its allied disciplines projecting multifaceted experiences, in its broad perspective. It enables the policy makers, administrators and scientists to evolve purposeful strategy for agricultural and rural development providing due share to women.

Regional Imbalances in Indian Economy

Caught in Computerised Confusion

S M Vidwans

Subjecting as many indicators of development as possible to multi-variate statistical analysis, researchers define, measure and analyse development to validate economic theories or pronounce policy prescriptions of great import, even though, disturbingly often, the statistical techniques they employ are incapable of supporting the type of conclusions they rush to reach. The present critique attempts to bare such serious infirmities of analysis commonly suffered by many a research endeavour in this field.

I

Introduction

THE EPW published in its issue of March 12, 1994 a long and apparently weighty Special Article "Regional Imbalances in Indian Economy over Plan Periods" by P C Sarker which sets out to attain an ambitious goal of developing measures to assess, "how far maldistribution of resources has been corrected and whether there has been a noticeable reduction in regional imbalances and changes in the relative placement of various states according to the degree of development."¹ Specifically, it attempts to (1) review the strategies adopted in various plans to reduce regional imbalances; (2) examine the impact of plan outlays on the development of states; (3) examine specifically whether the planning process has contributed to the reduction of regional imbalances, and (4) understand the structural changes in the pattern of development in different states. For its purposes, the article carries out a cross-sectional and temporal analysis of data, spread over a quarter century for 15 states in India, by quite sophisticated statistical and graphical techniques.

The article has seven sections including the Introduction in which Sarker makes a grand beginning with a series of simplistic statements about "global imbalances". After arriving on the home scene, he starts the second section with a reference to Indian Constitution and its Directive Principles. The latter, Sarker asserts, imply "removal of all types of imbalances including regional imbalances". The means to do this is the Five-Year Plan (FYP) and, in the third section, he comprehensively summarises all that the government of India (GOI) did in this behalf up to the VII FYP (inclusive), and achieves the first objective of the article. Sarker devotes the fourth section to a review of some studies in regional imbalances, conducted here and abroad, and refers to certain well known hypotheses and findings of famous economists, some of which he would test in his exercise. In the next two

sections, V and VI, he describes his data and his analytical and graphical tools displays the results of his analysis in 11 tables and 10 diagrams, and presents his conclusions which he summarises in the last section. It is difficult not to be impressed by the sweep of the article, by the battery of analytical tools trained at the data, and by the fact that the article benefited from suggestions by four senior professionals in this field.

The subject of my critique is the two sections, V and VI, of Sarker's article which are expected to meet its objectives (2) to (4) and which are the only parts that embody his own work. The main critique deals with major points. The statistical and other notes at the end give statistical results used for the arguments in the critique and deal *inter alia* with some of the several relatively minor flaws in Sarker's exercise. I point out in the critique that most of Sarker's analysis does not support his conclusions for the simple reason that it is incapable of doing so. But the critique is not a mere criticism of Sarker's work, for his failures are common to several other researchers whose work I perused in my study of this field. The critique, therefore, dwells more on the explanation of the issues ignored than on the fact that Sarker ignored them. That is its main purpose.

DATA

Sarker uses two sets of data: (1) Figures of per capita cumulative plan outlay, and (2) the values of 14 development indicators, both statewide for 15 major states of India and for five bench-mark years: 1960-61, 1970-71, 1980-81, 1984-85 the last year of the Sixth FYP, and 1986-87 the latest year for which data were available to him. Sarker's Table 1 shows the first set of data. He offers little explanation about what the cumulative plan outlays (CPOs) stand for except to quote the source and to say that sectors which are fully "under central government" such as the railways and posts and telegraph have been excluded. It is not known whether they cover direct central plan outlays in the states.

The second set of data, on 14 indicators for 15 states for five bench mark years - 1050 data elements in all - is not exhibited in the article, perhaps for the sake of brevity. But it would have been useful had at least the values of the means and standard deviations been given as that would have enabled a reader to understand directly the actual extent of inter-state disparities in different respects in different years and examine Sarker's findings against that information. A crucially important aspect of the number of his indicators (14) - variation over the five bench mark years - 11, 14, 14, 13, and 13 respectively. It would be useful to remember, which Sarker did not, this initially increasing and later decreasing sequence of numbers. Sarker acknowledges that "non-availability of data uniformly for the five bench-mark years and the use of estimates for some data items have introduced certain limitations in the study." But it is worse than that. The varying number of indicators has in fact played a havoc with Sarker's analysis and conclusions.

II

Did Regional Developmental Disparities Increase?

Sarker discusses this question in his subsection entitled, "Did Plans Reduce Inter-State Regional Imbalances?", and answers the question with the help of two statistical measures.²

(a) EUCLIDEAN DISTANCE

The first statistic Sarker uses is the Euclidean Distance, *d*, between the states, based on all indicators whose values Sarker standardises for every bench mark year separately. He gives the average of *d* in his Table 11. For the five bench-mark years, this average is, 5.07, 5.12, 5.20, 4.94, and 4.90 respectively, and thus varies by small margins. But Sarker perceives in the changing values an increasing trend in disparities from 1960-61 to 1980-81, and its reversal later, and

reaches a profound conclusion which I quote verbatim:

This indicates that the disparities between the states had increased till 1980-81, and with the pace of development, the disparities were reduced (*sic*) in the later years. This corroborates the growth model based on the cumulative causation theory of Myrdal (1957), Kaldor (1970) and Richardson (1973); where the polarisation effects are stronger in the earlier stages of development and bring more divergency. It also confirms the theory of an inverted U-shaped curve formulated by Hirschman (1958) and empirically supported by Kuznets (1957) and Williamson (1965)

A neat set of statistics and an exciting experience of witnessing the manifestation of famous theories and models in operation in the real life situation of India! Simple geometrical and statistical relationships, however, spoil the excitement.

If we measure p variables for each unit and calculate the d^2 for all possible pairs of n points representing as many units in the p -dimensional space, then

Average(d^2) = Two times the sum of variances of the p variables ... (1)

If the zero distance of the unit from itself is not reckoned on the LHS, the RHS is required to be multiplied by the factor: $n/(n-1)$. Since Sarker's variables have been standardised, their individual variances equal unity, and we have

Average(d^2) = $2p$... (2)

Therefore, for the five bench-mark years, the average of d^2 will be exactly equal to 26, 28, 28, 26 and 26 respectively.⁴ If Sarker had the necessary data for all of his 14 indicators for all bench-mark years, the average of d^2 would have been constant at 28 for the five bench-mark years, and it would have shown him that Euclidean Distance based on standardised values was an inappropriate statistic for comparing disparities over the years. The average of d might still differ, but that would be of no practical significance.

Sarker thus overlooked several points in this exercise. First, the actual differences in the average value of d are too small to be considered significant. Surely, serious economic theories require weightier evidence than this for their verification. Second, the five averages of d are not comparable as their dimensions differ. As a result, the first, the fourth and the fifth are by construction smaller than the second and the third. The increasing trend and its reversal are thus built-in and do not mean anything more than that. Third, even if full data were available, nothing could have emerged from the measure of Euclidean Distance. Fourth, the average Euclidean Distance (squared) is but

an exotic version of the simple measure of variance. Last, and more serious, since standardised values are used, the distance measure, like total variance, is related only to the number of indicators and not to their substance, and even if the actual indicators measured different aspects of development in different years, but their number remained the same, the average Euclidean Distance (squared) between states would be the same! Euclidean Distance based on standardised values is not thus an appropriate statistic to verify theories of Kaldor to Williamson.

(b) PRINCIPAL COMPONENT ANALYSIS

Based on the Principal Component Analysis (PCA) of standardised values of the indicators for every bench-mark year, Sarker's second statistical measure is the coefficient of variation (CV) of the first principal component (PC) score. From the changing values of this CV, he draws the same conclusion as before which I quote below verbatim.

From Table 3, it is observed that inequality had increased in the first two decades of the study period. For the first principal component scores, the CV increased from 96.59 per cent in 1960-61 to 142.64 per cent in 1980-81, and for the combined scores (CCS) it rose from 63.36 per cent to 102.60 per cent. Subsequently, the magnitude of the CV for both types of scores declined in the last two bench-mark years to around 53.00 per cent and 131.40 per cent respectively (*sic*). The decline in the value of the CV in the last 7 years indicates that the disparity had gone down in 1986-87. [The correct order of the last two percentages is the reverse one with 93.00 in place of 53.00]

This is followed by a reference to the same inverted U-shaped curve and to Williamson's explanation of the curve, and Sarker's observations about variations in per capita plan outlays. All this intellectual labour is really fruitless because, with the variable values standardised every year, a comparison of the CV of component scores over time tells us nothing about changes in disparity.

The statistical measure Sarker uses is an easy one to grasp the meaning of, and for the examination of Sarker's analysis, we need to understand precisely what a PCA achieves and some of its implications. I have highlighted these points in the first statistical note which also deals with Sarker's relatively minor lapses when he overlooked certain aspects of data and his analysis. I summarise them first. My comments refer to the first PC score but they equally well apply to Sarker's combined component score (CCS)

whose basis is also otherwise questionable. (See the second statistical note.)

First, since standardised values have been used, the total variance of the variables every year equals the number of indicators used in that year. The results of the PCA therefore also suffer from the same aberration introduced by the changing number of indicators. Second, all types of scores resulting from PCA have zero means, and a particular type has in addition unit standard deviation (SD). The means and sometimes the SDs of the scores can be set at will. Because of this characteristic indeterminateness of a PCA, the statistic CV lacks meaning. Third, even if Sarker can draw the same conclusion on the basis of the SD of the first PC score, the type of score he has chosen is inappropriate as it exaggerates the variation in the SDs by a power of two giving him a false idea of the inverted U-shape of the curve the SD traces.

But these are relatively minor lapses. Sarker's major error lies in not recognising that the variance (or SD) of the first PC has nothing to do with inter-state disparities in the original indicators, and therefore with changes in them. To see this, let us ignore all other flaws of Sarker's procedure and assume that the indicators and their number and therefore the total variance remain the same in all the years. Even then, the variance of the first PC score may vary over the years depending upon the degree to which the indicators are inter-related. The larger the absolute values of correlation coefficients between them, taken two at a time, the larger will be the variance of the first PC score and better would the first PC be considered as a composite indicator of overall development. Sarker too acknowledges this point but ignores it later. Thus the first PC improves its performance as a composite development indicator from 1960-61 to 1980-81, and keeps it up later. It is the only interpretation of the increasing SD of the first PC score. The increase might have come about because some states which were initially relatively developed in respect of one indicator but not so for some other one, later became relatively backward in respect of the former or relatively developed in respect of the latter – relative always to other states. Whether the change could be taken as a reflection of the theory of 'cumulative causation' at work, economists may ponder; but it does not have any association with changes in disparities in development.

It is easy to prove, in fact, that the change in the variance of the first PC score and the change in disparities are two unrelated aspects of the situation. For example, suppose the initial actual – not standardised – value x of

an indicator increases in the later year to X, given by

$$X = x + k(M - x) + C \\ = kM + (1 - k)x + C \quad \dots(3)$$

where M is the maximum value of the indicator initially, k is positive and less than unity, and C positive and constant for all x values. The model of change means that the smaller the initial value of the indicator, the larger the increase in its value. It is easy to verify that the variance of the later indicator(X) is reduced in the process and by a proper choice of k could be made negligibly small. Suppose further that similar changes took place in all indicators with varying values of k, M, and C. Then the variances of all indicators and therefore the total variance will be less in the later year under this model and could be made negligibly small. But the standardised values of and the correlation coefficients between the indicators would not change and, as a result, there will be no change in the first (largest) latent root and the variance of the first PC score and, following his logic of interpretation, Sarker will conclude that the extent of disparities remained the same in the later year even though we know that it, in fact, was less. Similarly, if the later value: X is given by the model

$$X = x + k(x - m) + C \\ = (1 + k)x - km + C \quad \dots(4)$$

where k is positive, m is the minimum value of the indicator, and C as before a positive constant for all indicator values x, the total variance will increase in the later year; but it will have no effect on the variance of the first PC score and on Sarker's interpretation which would continue to be divorced from the reality.

To conclude about changes in disparities from those in the variance of the first PC score and see in those changes manifestation of economic theories is thus a sheer misinterpretation of analysis, which in the present case is worse than that, compounded as it is by a wrong choice of statistic and its non-comparability over the years.

Thus, Sarker's exercise based on the Euclidean Distance and the PCA fails in its objective of assessing the changes in disparities over the study period. A little statistical derivation, without any analysis of data, was enough to help one foresee that this would happen.

III

Impact of Plan Outlay on Development

Because the first PC does not explain a large enough percentage of total variance, Sarker combines it with the second PC to

work out the CCS as a development index and discusses for every bench-mark year the ranks of the states based on it. Studying its relationship with the per capita CPO he concludes that "the states which received higher per capita cumulative plan outlays could become relatively more developed states." Finding Orissa to be an exception he carries out a regression analysis of per capita CPO (cause) and the CCS (effect), and finds the highly statistically significant R^2 between them to increase from 0.59 to 0.82 over the bench-mark years. He concludes from it that "...planning plays the accelerator role in the overall development of a state. States which were getting higher plan outlays (CPO) continued to develop faster." While the planners should be happy at Sarker's conclusion which might be self-evident to many, his analysis, as I show below, cannot support any such conclusion.

First, a reservation about Sarker's method of combining the first two PC scores into the CCS: the second statistical note explains it. Without endorsing Sarker's CCS, I would use it in what follows but would point out that the ranking of the states does depend upon how one combines the first two PC scores.

Ignoring this point and other inherent limitations of the method of ranking, one would see from Sarker's Table 4 that only Gujarat, Kerala and West Bengal change their positions. Assam too changes position but the state has remained scarcely comparable over the years except in its name. Thus the conclusion from that table would be that Gujarat shot up and Kerala and West Bengal slid down the development ladder in relation to other states. One may not have any serious objection to this finding.

However, Sarker's regression analysis of yearwise CCS on yearwise per capita CPO suffers from two defects ignored by him. One, that the CCS and CPO are timewise on different footing and two, a fundamental defect, that the analysis can only yield yearwise inter-state comparisons but not comparisons over time.

Just as the CPO is a cumulative figure, so are all indicator values but their starting times are different. The first per capita CPO for 1960-61 is based on the total outlays of the first two FYPs. It is unrealistic to relate it (as a cause) to the values of indicators for 1960-61 (as effect) because that assumes all indicator values to be zero at the beginning of 1951-52, i.e., before the first FYP. This is obviously not true for any of Sarker's 14 indicators except perhaps for one of them, X_2 : percentage of villages electrified, whose value might have been negligibly small to start with. To study a development process, one should deal either

with the differentials or changes in both variables, or cumulatives which are on the same footing. To do the latter, the indicator values for 1950-51 should be subtracted from all indicator values for the five bench-mark years.³⁶ Therefore, the very first R^2 which Sarker calculates is a questionable result; it should have been based on the increase in indicator values from 1950-51 to 1960-61. The R^2 values for the subsequent bench-mark years which are not independent of the initial value are all affected by this initial aberration.

The fundamental defect arises because although the per capita CPO, with some limitations such as effect of price changes, is not only comparable across states but also overtime, the CCS is not. Sarker standardised individual indicator values for every year separately and his CCS indicates only the relative development of states for a given bench-mark year, but its value for a state over different years does not represent the development of that state. The regression analysis of CCS with per capita CPO can only point out that the differences in the per capita CPO account for differences in CCS among states for a given year. But it cannot support Sarker's conclusion that planning (CPO) plays a role in the overall development of a state which is essentially a comparison over time for the same state.

To think that Sarker's regression analysis can be used to draw such a conclusion leads to an absurd corollary. Even if, in spite of plan outlays, no development took place, Sarker would still get a large enough R^2 and reach his conclusion! Consider the unlikely situation that plan outlays from 1961-62 and onwards had no effect in any state on the values of the 13 indicators already reached in 1960-61. Sarker's first two PC scores and therefore the CCS will remain the same for the later four bench-mark years as those for 1960-61. I carried out Sarker's regression analysis of these 'data' and those on per capita CPO and obtained values of R^2 equal to 0.47, 0.51, 0.52, and 0.53 for the later four bench-mark years respectively, with R positive and statistically highly significant for all years. If Sarker's logic of interpretation is followed, it will mean that development was positively caused by plan outlays. But we know that in this scenario no development took place at all! And the values of the CCS would not give any clue to this reality! This is proof enough – if one were required – to show that Sarker's analysis cannot meet with the objective of relating development as an effect of plan outlays.

The only, and possibly not an exciting, conclusion that can emerge from Sarker's procedure of analysis would be the simple

The Rediscovery of India

Rs 395.00

Ansar Hussain Khan

The book considers the partition of India in 1947 to have been the most disastrous of political solutions for the sub-continent. Tracing past history, it shows how the Indian leaders were manipulated by the British into seeing partition as the only solution. The author does not accept the official reasons for hurrying the negotiation, nor the claim that partition had become inevitable. The records of the transfer of power and earlier talks do not show the real spring that pounced partition upon the sub-continent. The book sets out to final precisely that.

A provocative book on the historical problems which have acquired a new dimension in the contemporary political scene.

India in a Changing World

Rs 50.00

(Tracts for the Times series)

Achin Vanaik

This tract provides an overview of India's place in the world, and by doing so sheds light on Indian foreign policy from Independence to date. It critiques political realism as a 'way of seeing' the world, especially in view of changing global context before and after the Cold War. Issues taken up include Kashmir, the human rights issue and the impact of Hindu nationalism.

The main focus of the tract is on the nuclear weapons issue.

Orient Longman

Orient Longman Limited, 3-6-272 Himayatnagar, Hyderabad 500 029

obverse one, that the more 'developed' states, that is those with higher CCS, afforded larger per capita plan outlays than what the 'less developed' did. And this comes out more effectively not from the cumulative outlays but from the plan outlays proper. To study this, I worked out the relationship between the per capita plan outlay, equal to the difference between per capita cumulative plan outlays for two successive bench-mark years, and Sarker's CCS for the first of the two years. The results are shown in the table below. I have dropped 1984-85 for the shortness of the intervening period.^{7,8}

x CCS for	y Per Capita Plan Outlay for	r ²
1960-61	1961-71	0.24
1970-71	1971-81	0.63
1980-81	1981-87	0.80

All r-values are positive. The first r² is statistically insignificant, but the other two are large and highly significant. Thus the tendency of more developed states to make larger per capita plan outlays, which was not in much evidence up to 1970-71, became very strong later. This contradicts Sarker's conclusion that "the imbalances in plan allocations started in the initial stage of planning process".

Sarker's analysis is thus incapable of assessing the effect of plan outlays on development of states, but if turned around, it will show that only in the latter half of the study period 1955-87, the tendency of more developed states to make larger plan outlays became stronger.

IV

Structural Changes in Regional Pattern of Development

The title of Sarker's third sub-section given above is enigmatic because of the use of both the words: structure and pattern. A clarification of its meaning or an explanation of his objective in substantive terms was necessary, but Sarker offers none and gets down instantly to the description of the tools of his analysis, namely, the dendogram and the graphical plot of points representing states according to their scores on the first two PCs. (I shall call them, for ease of reference, as the first and the second score respectively.) He also adds one more objective – apparently because that is what his graphical technique can also do – to that in the title: "to form 'clusters of states' according to similarities in their development process" (emphasis added). It would appear from this that his exercise has something to

do with the actual development process of every state. But it is not so.

I consider first the graphical plot of the two scores whose means have been restored to their original zero value by subtraction from them of their respective means both of which Sarker had arbitrarily set at 50 initially.⁹ Leaving aside how well they perform as indicators, one may reasonably consider that the first PC, i.e., the first score, indicates overall development and the second score, which is uncorrelated with the first, indicates the contrast of 'agriculture-SSI' versus 'urban-industrial' development. Sarker plots the first score on the X-axis and the second on the Y-axis. A few points need to be specifically recapitulated and noted.

The characteristic indeterminateness of PCA severely limits the interpretation of its results, especially when the PCA is carried out separately for every bench-mark year. Because the results refer only to variation or differences, it is impossible to understand absolute magnitudes from them because Sarker made mean values of all indicators for every bench-mark year equal to zero. If his first score indicates overall development, it only grades the states on that score, but it cannot tell whether the 'least developed' state on this score is underdeveloped in some real sense, or the 'most developed' by this score is truly quite advanced. This means that the first score would show that roughly half the states are 'developed' and the other half 'backward'. This will hold for all bench-mark years even though all states became developed over the years in some real sense. When a comparison of such relative positions, separately determined for some points of time, is made, it cannot provide any information about the 'development process'. For, an initially 'least developed' state may continue to be labelled so in all years even though it made tremendous progress, and became very developed in some real sense, simply because all others did better than it. By ignoring this basic limitation of his PCA,¹⁰ Sarker fails to see that his analysis cannot serve his objectives and this is equally true when he goes beyond overall development to direct it to structural changes on the basis of the second score.

The second score gives positive marks for the above-average values of indicators of the 'agr-SSI' sector or below average values of indicators of the 'urban-industry' sector. A high positive second score would therefore mean above-average 'agr-SSI' development or below-average 'urban-industry' development or both, and a large negative score will mean the reverse. The development of any state in either of the two sectors is understood only in relative terms, relative either to the average or other states. As a

result, the second score would classify roughly half the states as 'agr-SSI' developed which is the same thing as calling them 'urban-industry' backward, and the other half as 'agr-SSI' backward or 'urban-industry' developed. And this will also hold for all bench-mark years even if all states developed industrially or in agriculture. And like the first score, bench-mark yearwise second scores of any state do not tell us anything in absolute terms about the structural changes over time in the economy of that state. Consequently, for example, a state may take great strides in 'agr-SSI' development over the years but would still get a low second score if other states did better. The net result is that Sarker's analysis will only compare states for every bench-mark year separately but would not tell us anything about the change in the structure of development of individual states.

Let us now consider the comparative picture which alone can emerge from Sarker's analysis and his interpretation of it. We should note first, even for this limited purpose, that while the first PC gains importance over the five bench-mark years, the second PC loses it and as a result, the differentiation of the states, as 'agr-SSI' developed or otherwise, that the second score makes becomes less marked over the years. The conclusion should therefore be that the 'structural differences' between states became less important over the years. Second, the two scores are always uncorrelated. Disregarding both the facts, Sarker concludes:

"The influence of 'agr-SSI' sectors", that is the second PC, "among the less developed states was felt only in the later years of plans, i.e., 1984-85 and 1986-87. So at the end of the Sixth Plan, only Punjab and Haryana remained as highly 'agr-SSI' based developed states, far ahead of others, while Gujarat, Karnataka, Tamil Nadu, and Maharashtra became the 'urban-industry' based higher developed states. The same trend continued in 1986-87 as well."

With some difficulty, I have, I think, understood what Sarker wants to say. It is this. Initially the less developed states were not necessarily 'agr-SSI' developed (i.e., 'urban-industry' backward). Later, the two characteristics, being less developed and being 'agr-SSI' developed (i.e., 'urban-industry' backward), became associated with each other, with the exception of Punjab and Haryana. But Sarker's finding of such an association is contrary to the very fact that the two principal components are uncorrelated. One must explain this contradiction, this wrong impression about the 'influence' of the second PC on the first.

The graph divides the two-dimensional space into four quadrants which are conventionally numbered Q_1 to Q_4 in an anti-clockwise manner, with X and Y both positive in Q_1 . The distribution of states in the five bench-mark years over the four quadrants is seen from Sarker's graphs to be as follows:

	Number of States in			
	Q_1	Q_2	Q_3	Q_4
First score	(+)	(-)	(-)	(+)
Second score	(+)	(+)	(-)	(-)
1960-61	4	4	3	4
1970-71	2	3	4	6
1980-81	2	6	1	6
1984-85	2	7	2	4
1986-87	2	7	2	4

Since in actuality the two scores are uncorrelated in all bench-mark years, one would expect a roughly uniform distribution of the 15 states in the four quadrants as was observed in 1960-61. Later, there clearly appears to be a clustering of states in Q_2 and Q_3 . Even those states which fell in Q_1 , in 1980-81 and later, were either close to the X or Y or both axes, that is, they just escaped being in Q_2 or Q_3 . This means that from 1980-81 onwards less (more) developed states were more (less) developed in 'ag-SSI' sector or less (more) developed in 'urban-industry' sector, all comparisons being purely inter-state and no absolute meaning being attached to the term 'development'. Punjab and Haryana continued to be in Q_1 with increasing high positive values of either X or Y, or both, and that appears to be the only reason why the two scores remained uncorrelated on the one hand and, on the other, of the apparent clustering of other states in Q_2 and Q_3 which led Sarker to discover structural changes. The high skewness of data thus appears to explain the contradiction and with appropriate transformation of original indicator values, the analysis will bring out the lack of relationship between the two scores and of any basis for Sarker's conclusion.

There is little to say about the dendograms which are pictorial representation of the results of cluster analysis. The cluster analysis forms clusters based on internal (relative) homogeneity and external separation. But it does not tell us anything more than that; for example, it does not identify cluster of states as those of developed states, or of backward states, or of those with in-between status, unless they lie in Q_1 or Q_3 . A dendogram has the same weakness and Sarker uses information from his other analysis while describing these pictures. But a dendogram is further ineffective in representing reality because a highly developed state and a

backward state will appear as neighbours in it simply because both are removed from the rest although on their opposite sides. Observe, for instance, from the dendograms that Kerala in 1960-61, 1970-71 and 1980-81, and Orissa in 1984-85 and Assam in 1986-87 appear as neighbours of Punjab and Haryana only because they are quite far from the rest but on the other side of Punjab and Haryana on the development scale. It is informative to identify clusters and nice to draw pictures to represent information otherwise obtained; but it is not clear how, by themselves, these pictures help in telling anything about disparities, development, or structural changes.

V

Concluding Remarks

At the end of it all, we thus have a lot of analysis bearing little fruit. To the question whether disparities increased or decreased, the analysis produces no answer and certainly no evidence to support Sarker's conclusion that they increased up to 1980-81 and then decreased. Sarker sees in the inverted U-shaped curve traced by his statistic of distance a verification of the theories and hypotheses of famous economists. But this curve is only a reflection, in the Euclidean mirror, of the inverted U-shaped curve traced by his number of indicators!

The changing variance of the first PC score, besides being similarly influenced by this changing number, does not tell us anything about the changes in disparities but only about the strengthening of the correlation between the indicators.

The conclusion that the plan outlays have a positive influence on the development process does not need Sarker's involved analysis which cannot cast any light on the operation of this influence, positive or otherwise. The analysis that would be consistent with his procedure can actually establish the converse, namely that, lately, the outlays had a positive relationship with the development status already achieved by the states at the beginning of the respective plans.

And the third ambitious objective of understanding structural changes in the pattern of development in different regions remains unattained despite graphics and pictures. What the visuals provide is a comparison of general development of states – relative to other states – at different points of time but not over time, and of the relative importance, again relative to other states, of agriculture versus industry. But if the term 'structural changes' means the changing importance of the primary, secondary or tertiary sectors in the economic

growth of states, Sarker's analysis cannot produce any information on it.

Of the four, the only objective Sarker attains – and without statistical analysis – is his first one of reviewing the GOI strategies to reduce regional disparities. But I suspect that when he viewed state plan outlay as a causative factor for development and disparities, he laboured under a not exactly correct impression that these outlays were completely determined or allocated by GOI. If he did not, his investigation of relationship between plan outlay and development loses much relevance to his third objective. That misunderstanding also perhaps led him to reverse the roles of the two as cause and effect.

Lastly, some substantive questions. Sarker gives in his Table 2 the results of the PCA, i.e. of the 'loadings' of different indicators which are also the correlation coefficients of the PCs with the indicators. The results show some clear aberrations that needed explanations which Sarker does not offer. One does not therefore know whether he noticed them in his rush to analyse and interpret. For example, one expects a large enough negative correlation coefficient between poverty percentage and the first PC which reflects overall development. This is observed in all five bench-mark years except in 1970-71. Why? The correlation coefficient of the indicator on roads with both PCs is zero in the last two bench-mark years. Sarker concludes from this that roads ceased to be an indicator of development; a strange conclusion indeed! But, why? Because there was later little variation in the indicator value among states? Why are the correlation coefficients, with both the PCs separately, of X_5 : Per capita state income from manufacturing sector, and X_6 : Average daily employment per lakh of population in registered factories, almost identical in all the bench-mark years? Has this something to do with how the two statistics are generated, or because the two are so highly correlated that one of them is superfluous? And if so, would not the inclusion of both in the analysis influence his conclusions because the results of a PCA are affected by addition of variables especially so if one of them is highly correlated with one or more of the already included ones. Why has the correlation coefficient of per capita state income from agriculture with the first PC suddenly dropped in 1970-71? These substantive questions deserved recognition, answers and explanations before the interpretation of an aggregative analysis to compare situations over time was made. Without them Sarker's exercise, although based on sophisticated analysis, tends to lack substance and meaning.

Sarker attempted to answer many questions, about disparities, about planning

and development, about structural changes. He should have spelled out the questions clearly and specifically and established links between them and the type of analysis he would make clarifying the suitability of the latter for the answers to the former. Instead, his exercise is more technique-oriented than subject-oriented. He had a set of tools of analysis and he wielded them to attack the questions unmindful of the efficacy of his tools for the problems at hand. In the process he subjected his data to well known techniques of analysis and then forced a type of interpretation on the results which the analysis could not bear but which his questions needed. This is tyranny of sorts.

A GREEK TRAGEDY

But it fails inevitably and predictably. As soon as the variables were standardised separately for each bench-mark year, the analysis became divorced from a study of disparities and changes in them. His PCA, using variables with zero means, can only make inter-state comparisons at different points of time without reference to the absolute states of development. Because of the characteristic indeterminateness of PCA, there was no possibility of studying the development process or structural changes in real terms which are essentially comparisons over time. Compounded with both these severe infirmities was the variation in the number of indicators which vitiated any other temporal comparison that could be made and which destroyed his analysis. Rather than working out the effects of these realities on the possibility that his analysis would not bear an interpretation relevant to his objectives, Sarker raced through his massive computational exercise and interpreted his results ignoring their true and limited meaning. Confusion and misinterpretation were inevitable. He became a prisoner of the analytical procedures and mechanisms rather than one concerned with their relevance to the substantive issues underlying his questions. The scale of his computational work led me to assume that he used a computer and ready softwares,¹¹ and that assumption made me employ the adjective 'computerised' in the title of this critique. I hope my assumption is correct.

Statistical Notes

(1) Principal Component Analysis (PCA)

It is useful first to dwell upon the point: In a study of developmental disparities, why carry out the PCA and work out the first PC? The general idea is like this. It

is assumed that there exists a quality termed 'development', whose meaning is generally understood but not exactly and independently defined, and which, although not measurable directly, is assumed to be possessed by different units (states in our case) in different degrees. The objective of the PCA is to generate a 'measure' of this quality using several indicators of development on which data are available. It is also assumed that it is the variation in the degree to which states possess this quality of development that dominantly introduces statewide variation in the values of any particular indicator. The PCA generates a linear function of the indicators, called the first PC, which accounts for the largest percentage of the total variance over the states of all indicators. Against the background of the above assumptions the function is interpreted to measure, in some sense, the quality 'development'. The problem of defining 'development' is also thus solved in the process as development gets defined mathematically in terms of a linear function of the indicators themselves. That is a bonus the PCA offers! It follows from this that the larger the variance of the first PC, the better it is as a composite indicator of development. Without the assumption of such a substantive basis for the very analysis, PCA is just a mechanistic approach for reducing the dimensionality of data. And if this basis is ignored, the interpretation of PCA results can go astray.

We now turn to the procedure of PCA. If x_i ($i = 1, 2, 3, \dots, p$) are the original variables (indicators) measured in the same units with variances equal to v_i , and V is the sum of the variances, the PCA transforms the x_i s into a new set of uncorrelated and standardised variables z_i s which are called principal components (PCs). The PCA is carried out in the following stages. First we transform the x_i s to y_i s by an orthogonal transformation so that the variance of y_1 is maximised; variance of y_2 is then maximised subject to the condition that y_2 is uncorrelated with y_1 ; and generally, the variance of y_i is maximised subject to the condition that y_i is not correlated with y_1, y_2, \dots, y_{i-1} , i.e., with the preceding y 's, and so on up to $i = p$. This involves working out the latent roots and latent vectors of D , the covariance matrix of the x 's. In practice, only the first few of the y 's and the linear transformations for them are required to be considered so that a large enough proportion of V is accounted for by them. The z 's are worked out from the corresponding y 's by division of the latter by a scalar quantity to make their variances equal to unity. It is enough for our discussion to consider only the y_1 and the first PC z_1 . We shall denote them by y and

z respectively and drop one subscript throughout in what follows.

To work out the first PC, we find the first latent (column) vector: $a = [a_i]$ which satisfies the matrix equation

$$Da = Ma \quad (5)$$

where M is the first latent root and is a scalar. The algorithm gives simultaneously the elements of a and the value of M . From a , two other vectors u and w are worked out with $u_i = a_i / (\sum a_i^2)^{1/2}$, and $w_i = M^{1/2} u_i$. This, in all, generates three linear functions of x 's.

$$a(x) = \sum a_i x_i \quad (6)$$

$$y(x) = \sum u_i x_i \quad (7)$$

$$w(x) = \sum w_i x_i \quad (8)$$

and from $w(x)$, the first PC $z(x)$ by

$$z(x) = w(x)/M \quad (9)$$

The coefficients of the x 's in the four linear functions thus differ only by a common constant and the proportional values of any two coefficients remain the same. The variance of $y(x)$ is M , of $w(x)$ M^2 , and of $z(x)$ unity, and the sum of squares of w 's is also equal to M . The w 's also give the values of the covariance of the $w(x)$ with the original variables; if the latter are in a standardised form, the w 's give the values of the correlation coefficients of $w(x)$ with the original variables. The matrix D in this case becomes the correlation matrix. The reason for setting down the three linear functions $y(x)$, $w(x)$, and $z(x)$, in addition to $a(x)$ based on the latent root, is to bring clarity to the discussion since the term component score can be applied to any one of the three. If the objective of the analysis is to rank the states for a given set of x -values, that is for a given bench-mark year in the present case, it does not matter which of the three, or even if $a(x)$, is used. But if the objective goes beyond that, as Sarker's does when he compares PCA results over the years, then the distinction among the three matters, as their variances differ. Note that it is the variance of $y(x)$, that is M , which is additive over all PCs (if worked out) and the total of all such M -values will equal the total variance: V , of the original variables.

An important aspect of the PCA is that since it essentially deals with variances, which are unaffected by addition to or subtraction from all observations of a constant value, the mean of the scores can be set at will. For $z(x)$, since it is a standardised value, even the standard deviation (SD) of the scores based on it can be set at will in addition. Interpretation of the PCA results must recognise this characteristic indeterminateness of the PCA. For example, the statistic CV has no meaning when applied to the component scores.

Against this background we now examine what Sarker's analysis actually gives and what interpretations he has put on it.

The total variance of the standardised original variables is 13, 14, 14, 13, and 13 respectively in the five bench-mark years. Sarker gives in his Table 2 the values of what he calls 'component loadings' for the first two PCs. These are obviously the values of w 's. The percentage variance explained by the first PC increases from 37 to 51 per cent from 1960-61 to 1980-81 and stays around 51 in the last two bench-mark years. All that this means is that the first PC becomes a 'better' indicator of overall development from 1960-61 to 1980-81 and maintains that level of quality in the later two bench-mark years.

Sarker gives the values of the component scores in his Table 3. He describes the procedure of their calculation in the footnote to the table. It appears from it that the scores are the values of $w(x)$ with their variance equal to M^2 and not of $y(x)$ with variance equal to M . For the first PC of 1960-61, with $M = 4.8295$, the variance of the w -scores should be the square of this and their SD equal to M . However, the SD of Sarker's first PC scores is 48.30. Further, since he has worked with the standardised values of indicators, the mean of the scores should be zero, but it is 50. It is obvious that Sarker has made a linear transformation of the scores based on $w(x)$ by multiplying them by 10 and adding 50 to the product to work out his scores. Since the mean is thus arbitrarily set at 50, the calculation of CV and its interpretation lack meaning.

In the table below I have attempted to analyse the situation created by Sarker's procedures. The percentage of total variance the first PC accounts for is given in line (3) and from this and line (2) we get the variance of the first PC score in line (4) which is the variance of the function $y(x)$. The SDs worked out from them multiplied by 10 to make them comparable with Sarker's linear transformation of scores are shown in line (5). Line (6) will be explained later. Line (7) gives the values used by Sarker.

The SD of Sarker's scores, given in line (7), increases from 48.30 in 1960-61 to

54.60 in 1970-71 and more sharply to 71.32 in 1980-81, an increase of 48 per cent over its 1960-61 value. The SD then decreases to about 66 four years later and stays there in the last year also, 36 per cent higher than its 1960-61 value. Sarker will still draw the same conclusion: inverted U-shaped curve and all, from these changes in SD.

But these changes have been exaggerated by construction of his statistic. Since he desired to compare the SD over the years, he should have used $y(x)$, whose variance is a part of total variance of the original variables, and not $w(x)$ because its variance, which is not additive over all components, would add to very much more than the total variance if so added (even without the multiplication of the component scores by (10)). The result is that the difference over the years is exaggerated artificially by a power of two; compare line (5) with line (7). The SD actually increases by only 21.52 per cent in 1980-81 over its value in 1960-61. Thus the use of a wrong statistic gives an exaggerated impression of increase in variance of the first PC and, by Sarker's logic, in disparities over this period.

Secondly, the trend in the SDs is partly due to the change in the total variance of the original indicators (line (2) of the table) which in turn is solely determined by the changing number of indicators (line (1)). Thus the increase in the SD from 1960-61 to 1980-81 is due to two reasons: One, the number of indicators increased from 13 to 14, and the percentage variance accounted for by the first PC also increased. It is not possible to make an adjustment for the first factor to make the SDs comparable, for the entire analysis will have to be redone using only the same thirteen indicators of 1960-61 for all bench-mark years. However only to roughly see the possible effect of such an adjustment, I have adjusted the SDs in line (5) for 1970-71 and 1980-81 by multiplying them by square root of (13/14), i.e., by 0.9636, and shown the results in line (6). The SD for 1980-81 is now only about 17 per cent higher than that in 1960-61 and changes very little later. The inverted U-shape of the curve disappears!

(2) Combined Component Score (CCS)

The reason why Sarker combines the two scores is that the first PC accounts for at the most 52 per cent of the total variance in all bench-mark years, which in his view is not large enough for it to be considered an appropriate indicator of development. The first point that arises is whether such a combination continues to be a development indicator, for the second component distinguishes states with the same level of overall development according to the relative development of 'agr-SSI' or 'urban-industry' sectors, the term relative applying to states. Therefore the meaning of the combined component score (CCS) needs to be stated.

Second, if the two scores are to be combined into a CCS, the CCS should account for the total of the variances accounted for by the two components. For this, the CCS should be the total of the two y -scores, which in effect means weighted addition of the two w -scores with weights inversely proportional to the square root of the respective latent roots. And since the CCS is to be used for ranking the states or for regression analysis, it does not matter if instead of the weighted addition, a weighted average is worked out with these weights. What Sarker has done is the opposite when he uses weights proportional to the variance of the respective score, that is proportional to the two latent roots. In the process he has given an unduly large weight to the first PC score. He should have given a rationale for this peculiar system of weights, or if it has been established by some other researcher, should have explained it. His system of weights thus appears arbitrary, and the meaning of CCS a mystery.

Notes

- 1 This is an instance of Sarker's loose terminology. In the preceding paragraph he refers to uneven distribution of natural resources, and after that sentence, he switches, without the reader noticing it, to distribution of financial resources by government of India.
- 2 Given that the situation under study is not expected to change in two years' time, there appears to be little point in comparing it for 1984-85 and 1986-87. Further, the inclusion of 1984-85 in this series does help give a wrong impression about the shape of the curve.
- 3 Ignore the superfluous adjective: regional, and the undefined term: imbalance; the latter, one must assume, is a fancy but misleading synonym for disparity or inequality. The question itself is loaded. It is one thing to ask whether disparities changed over plan periods; it is an altogether different thing to implicitly ascribe changes in disparities to plans as the causal factor. While only the government builds roads, constructs

TABLE

	1960-61	1970-71	1980-81	1884-85	1986-87
1 Number of indicators	13	14	14	13	13
2 Total variance	13	14	14	13	13
3) Per cent variance explained by first PC	37.15	39.00	50.94	50.53	50.54
4 Variance of $y(x)$	4.83	5.46	7.13	6.57	6.57
5 10 times of SD of $y(x)$	21.98	23.37	26.71	25.63	25.63
6 Adjusted (5)*	21.98	22.52	25.73	25.63	25.63
7 SD of first PC as given by Sarker	48.30	54.60	71.32	65.69	65.70

* Line (6) = Line (5) x Sq root of [13/line (2)]

irrigation projects or runs public health services, private investments, initiative and efforts play an important role in other sectors. Only five of Sarker's 14 indicators are directly affected solely by governments' actions. It is thus rather simplistic for Sarker to assume that whatever happened to disparities was due to plans.

4 The averages of d^2 I have worked out using figures from Sarker's Tables 6 to 10 are 26.0, 27.2, 28.7, 26.0 and 25.7 respectively. Their differences from the theoretical values are due to rounding of numbers at various stages in the calculation of the values of d .

5 This would of course mean that one will have to give more serious attention to the substance of indicators which could be quite a difficult but necessary task.

6 It of course assumes that there are no lags between expenditure and achievement, a rather unrealistic assumption. But Sarker also makes it when he says that "... development in a particular year would be the effect of all plan expenditure till that particular year...". So lags would have to be ignored. And if they cannot be, then one should use long enough periods for analysis so that their effects are minimised. But the basic point about increments remains valid.

7 The analysis ignores the reality of the time lag in the availability of statistics which may be of a few years in most cases. Thus the indicators for 1960-61 may not be available at the beginning of the third plan.

8 Rather than the CCS, the two PC scores could have been used directly in a bi-variate regression of the plan outlay on them to yield better results.

9 It is curious to find the mean of the second score for 1986-87 in Sarker's Table 3 to be 51.82 which does not appear to be a printing mistake and required an explanation

10 The fact that he set the means of all scores arbitrarily to 50 should have been a constant reminder to him of this limitation of his PCA.

11 That a software can shackle one is amply illustrated by Sarker's very first table. Apparently, the software was set to give the average, the SD, and the CV of figures in a column, whatever those figures may be. The meaning of the average of growth rates, which the table gives, is rather doubtful. What was important was the growth rate in the all-state average per capita CPO for comparing the states' growth rates. Sarker should have given its value, but apparently the software did not permit it. Incidentally, the last three of the five growth rate calculations shown in this table are wrong.

SSI) with little economies of scale are the ones which are tailor-made for the prevalence of competition with a large number of small producers, each producing a very small part of the output of the industry and hence having little control over total supply. An argument which theoretically looks sound. He also says that it makes no economic logic for large producers to enter such sectors for manufacturing which do not offer economies of scale. At the same time, Nair argues that many large producers have clandestinely or openly gone for SSI subsidiaries (indirectly, he admits that reservation policy is not effective in its true sense).

Nair's inferences would have had validity had his basic assumption been true, i.e. items reserved for SSI do not have economies of scale for large scale producers. This basic assumption itself is weak. It would be difficult to conclusively prove that reserved items like ice cream, biscuits, alkeresin, sugar boil confectionaries, tooth paste, etc. do not have economies of scale for large scale units. Even if we assume that his basic assumption is true, empirical evidence is lacking to prove his related argument that such reservation does not curb competition, rather encourages it.

As per nine-digit industrial classification, there are 1,076 items reserved for SSI. Of these, 233 items are not at all manufactured by SSI.¹ Another 692 items have negligible presence in reserved SSI output.⁴ Thus, 925 items are prime candidates for immediate dereservation. Had Nair's aforesaid argument been true, this kind of situation would not have arisen. Even among the rest, items like readymade garments, plastic toys, scientific instruments and agricultural implements are suggested for dereservation on the grounds of modernisation and economies of scale.⁵

Nair's second contention is against my inference that reservation policy has not led to diversified growth of reserved small scale sector. He argues that the data presented in my paper do bring out that there has been some amount of industrial diversification in reserved SSI. He concludes his argument by questioning the very logic for expecting diversified growth, in view of the heterogeneous nature of reserved items.

Reservation policy had been initiated with the objective of, among others, having the bulk of the increased production of reserved items from SSI. (In 1971, reservation list comprised as many as 124 items.) Further, if we go by Nair's assumption that these items do not have economies of scale and would attract many small scale producers to enter the fray, it would be fairly justified to expect rapid growth of reserved SSI with respect to most of these items, if not all. But this did not happen. The decline in the

DISCUSSION

Small Industry Reservation Policy

M H Bala Subrahmanya

OF late, any reference to the performance of product reservation policy for small scale industry (SSI) receives wide protests from different quarters as if such reference tantamounts to opposing the very existence of the SSI sector. Any policy has to be evaluated pragmatically and not emotionally. Product reservation for SSI might have been a good policy when it was conceived. As of now at best it might have only protected the growth of some individual units/industries.

The objective of any policy must be to encourage the development of the sector it is meant for. This will be in the interest of producers and consumers alike.

The emergence of efficient SSI sector is as much essential as the emergence of efficient large scale industry (LSI) to have an internationally competitive domestic industry in the current context of economic liberalisation. Product reservation may not be conducive to achieve this objective. Neither of the sectors can be sacrificed or encouraged at the cost of the other. A strategy of promoting SSI with LSI

would be appropriate rather than SSI versus LSI.

With this backdrop, I would like to clarify the inferences and conclusions of my paper, 'Reservation Policy for Small Scale Industry: Has it Delivered the Goods?' (*EPW*, May 27, 1995)¹ with reference to K R G Nair's comments (*EPW*, September 2, 1995)².

In his comments on my paper K R G Nair has questioned my analyses on the basis of four broad issues: competition, industrial diversification, growth performance, and efficiency. According to him, whatever evidence is provided in my paper is not sufficient to discard the reservation policy, rather they do bring out some positive achievements of the policy. He goes further to quote the studies of Subramanian (1995) and Freeman (1974) to bring home the points that SSI does better: (i) in a protective environment, and (ii) in terms of inventive performance than large scale units.

Nair's contention against my argument that reservation curbs competition is based on weak assumptions: sectors (reserved for

share of top 11 items in the reserved SSI output from about 48 per cent in 1972-73 to about 13 per cent in 1987-88 does not bring out that this has been due to industrial diversification. Of the 48 top items which accounted for about 78 per cent of the reserved output in 1987-88, 37 items have been included in the reservation list at different points of time between 1972-73 and 1987-88. From these we can infer that reservation did not make much impact on a vast majority of 124 items which continue to remain in the reservation list. The fact that the majority of the dominant (48) SSI items have been included subsequently lends credence to the inference that it is the steady expansion of reservation list which resulted (1) in a decline in the share of top 11 items in reserved output, and (2) in a marginal increase in the share of reserved output in total SSI, during 1972-73 to 1987-88.

Nair's contention against my analysis regarding the performance of reserved sector *vis-a-vis* unreserved sector based on growth and capacity utilisation is not convincing. It is true that there was marginal improvement in the capacity utilisation rate of reserved sector as compared to unreserved sector during 1972-73 to 1987-88. Further, there was not much difference in the capacity utilisation rates of reserved sector (47.73 per cent) and unreserved sector (50.49 per cent) in 1987-88. My Table 5 brought out clearly that there are some reserved sectors which utilised more of their capacities than the unreserved sectors, though in most cases capacity utilisation rate was higher in the latter than in the former. Similarly, the difference in the growth rates of unreserved sector (13 per cent) and reserved sector (10.3 per cent) was minimal. But these statistics are not weak enough to discard the inference that unreserved sector is better off than the reserved sector.

It appears that Nair has missed a point in his enthusiasm to favour the reserved SSI sector. To study the impact of reservation, it would be sufficient to concentrate on reserved SSI. But to study the impact of dereservation, it would not be sufficient to concentrate only on the growth of dereserved SSI sector. One has to find out how many large-scale units have entered into the manufacturing of dereserved items? And what is the output growth in the large-scale sector? In the absence of such statistics, it may not be proper to conclude that items included in the reservation list have grown faster than the items taken off from the list. That is why I have only compared Tables 6 and 7 and avoided a comparison between Tables 7 and 8.

Even among the top 10 items (Table 8), the higher growth of items like ready-made garments and plastic toys cannot be solely

attributed to reservation. These are generally high growth industries in all developing countries.

Perhaps realising the essentiality of raising the investment limit for modernisation that the government now permits a five-fold increase in the investment of SSI in garments industry, i.e., up to Rs 3 crore with an export obligation of 50 per cent of the output. A welcome step towards dereservation.

Nair's argument that Subramanian's (1995)⁶ inferences and conclusions support none of mine is fallacious. By quoting just some of the findings of Subramanian, Nair is trying to create an impression that capital productivity can be the sole indicator of efficiency, which is not true. Also, findings confined to one particular year do not imply much and, therefore, much caution has to be exercised while using such data for inference. It appears Nair has deliberately ignored Subramanian's subsequent analyses and findings pertaining to a longer time-frame in the same paper. Subramanian has made it clear that the defence of any policy approach to SSI rests on growth with efficiency (either static efficiency or dynamic efficiency or both).

Subramanian estimated the change in the value of efficiency ratios in SSI between two time points (1972 and 1987-88). He concludes that efficiency in terms of value-addition (transformation efficiency) in SSI has declined. Also, the rate of increase in capital productivity is marginal whereas capital intensity has increased substantially. There has not been any significant technological progress in SSI. On the basis of his estimates of total factor productivity growth (TFPG), he concludes that on the count of dynamic efficiency, which implies technological progress, SSI has faltered; rather failed.

What is interesting is to observe Subramanian's conclusion: "It seems, a shift in the direction of policy and targeted efforts away from the present one saddled with product/price reservation towards technology development is needed..."⁷

Further, according to Nair, reservation does not prevent modernisation and technological upgradation. But my clarifications

of previous issues are sufficient to infer that product reservation does hamper modernisation and technological upgradation in SSI. It is common knowledge in industry that application of sophisticated technology to manufacture products of international quality requires investment (in plant and machinery) of much more than Rs 60 lakh in industries such as garments, sugar boil confectionaries, scientific instruments, agricultural implements, and so on. Product reservation will keep such industries away from modernisation.

In this regard, it would be worthwhile to make reference to the findings of recently conducted empirical studies: Awasthi, Krishna and Sebastian (1993)⁸ and NCAER-FNST study (1993)⁹ have brought out clearly that product reservation has achieved little for SSI and the policy as such has lost much of its relevance for continuance. To conclude, any attempt to magnify virtues in the reservation policy may be a futile exercise especially when empirical evidence proves that achievements of the policy are neither substantial nor significant.

BOB GROWTH '95

WITH
SAFETY NET
FROM
BANK OF BARODA

FEATURES : ■ Close-ended growth oriented scheme for a period of 7 years. ■ Minimum investment of Rs. 1,000/- and in multiples thereof for Indian Residents and Rs. 10,000/- and in multiples thereof for NRIs, FIs & OCBs, whose investments are fully repatriable ■ No ceiling on maximum investment ■ Upto 90% of the funds collected to be invested in equities and related instruments

HIGHLIGHTS : ■ Safety net with buy-back 'at par' for 1 year commencing 6 months after the date of allotment up to a maximum of Rs. 50,000/-. ■ Accidental Death Insurance cover of a minimum of Rs. 20,000/- and a maximum of Rs. 5 lacs for Residents. ■ Listing on Bombay and National Stock Exchanges. ■ Loan facility from Bank of Baroda & Dena Bank.

SCHEME OPEN FROM 6TH NOV. TO 20TH DEC. '95

RISK FACTORS : ■ Mutual Funds and securities investments are subject to market risks and there is no assurance that the Fund's objectives will be achieved. ■ As with any investments in stocks and shares, the Net Asset Value of the Units issued under the Scheme can go up or down depending on the factors and forces affecting the capital market ■ The sponsor is not responsible or liable for any loss resulting from the operation of the Scheme beyond the initial contribution of an amount of Rupees Ten Lacs made by it towards setting up of BOB Mutual Fund or such other amounts lying in the corpus from time to time. ■ Past performance of the Sponsor i.e. Bank of Baroda does not guarantee the future performance of the Scheme of BOB Mutual Fund. ■ BOB Growth 95 is the name of the Scheme and does not in any manner indicate the quality of the Scheme, its future prospects or the returns. ■ Please read the Offer Document before investing

From Victim to Agent

Literature about the Emergency has tended to portray the intellectual as the emotional sufferer, the bureaucrat as the active participant and the poor as the passive victim. These stereotypes, however, mask the most frightening aspect of the Emergency regime — its success in drawing, through fear, people of different groups into active participation. Memories of the Emergency from a resettlement colony in Delhi. 2921

True Cost of Government Expenditure

Any listing of the benefits of state intervention in the market, and hence of public expenditure, is incomplete without a parallel enunciation of the costs of public expenditure. On this point the advocates of state intervention and higher public expenditure have been less than forthright. 2933

Human Rights and Third World

In the aftermath of the failure of the Soviet socialist experiment, the capitalist camp led by the US is taking a narrow view of human rights in the third world, policing the observance only of civil and political rights. third world countries should struggle for an international declaration and programme of human rights in the broader sense, including rights to resources, food, education, health and a clean environment. 2937

Different Profiles

There are major differences in the socio-economic and demographic profiles of the major religious communities in India, an appreciation of which is essential for a better understanding of contemporary Indian society. A review of social, economic and demographic data from Census and National Sample Survey publications. 2941

Judiciary and Bhopal

The aftermath of the Bhopal disaster demonstrates the incapability of the legal and judicial system to provide justice to the victims of industrial disasters and the system's failure to act deterrently against industrial/environmental crimes. 2907

Hidden Agenda

The international attention the 1994 plague epidemic in Surat received was not driven so much by genuine public health concerns as by the calculation that the highlighting of the occurrence of epidemics in a stereotypically poor country like India has the effect of setting the industrially developed countries above the seemingly 'chaotic' and 'substandard' conditions of the developing countries. 2912

New Wealth

Biotechnology spells megabucks today, but the developed countries possess little or no germplasm. Hence their attempt to create instruments and institutions to control the genetic wealth of the developing countries. 2916

Opening for the Left

With social polarisation favouring the SP-BSP suffering a setback, Mulayam Singh's fortunes in UP now depend on his aligning with the Janata Dal and the left forces. 2910

Pakistan's Mini-Budget

The economic policy signals sent out by the Pakistan government's mini-budget in October are confusing and contradictory. 2918

Black Politics in US

The emergence of Colin Powell in US politics denotes the decline of radical black politics and the rise of middle class blacks in the country. 2919

National Accounts

Comprehensive statistical statements on various national accounts aggregates for India for the 44-year period from 1950-51 to 1993-94 in the EPW Research Foundation's Special Statistics series. 2955

Rights Violations in Chattisgarh

THE forest mafia backing the forest ranger J J Acharya, has continued its attack on social workers of Raipur district, in spite of protest letters to the chief minister. In yet another mafia-style operation, Acharya organised an attack at the public meeting organised by the Chattisgarh Mukti Morcha in Keramunda village of Basna Thana in Raipur District of Madhya Pradesh, lathi-wielding forest guards chased the incoming public, punctured the tyres of vehicles and beat up social workers who were organising a solidarity meet in this remote tribal village on November 1. The police administration, present in considerable numbers on the spot, remained spectators while a section of the police actively participated in repressing the people and their right to assembly. Shiv Kumar Patel and Ram Bahadur Vishwakarma, two social workers with Mukti-Niketan, a self-development project for the released bonded labourers for the past 10 years, were brutally beaten up at Kudarihra village, about 2 km from Keramunda, simply because they questioned the anti-democratic and criminal ways of the ranger in dispersing the peaceful gathering of the released bonded labourers and peasants. They were falsely implicated in instigating about 300 village-folks in cutting the forests in Keramunda, while the fact remains that these social workers have been known for promoting ecological concerns amongst the released bonded labourers, and distributed five fruit trees every year under a green campaign carried on by the Mukti-Niketan.

Rajendra Sail, organising secretary, National PUCI, was also threatened with dire consequences, and the ranger instigated anti-social elements gathered by him in Keramunda village against Sail. These elements who included a section of the rich farmers owing allegiance to the ruling party were promised free access to forest and its produce if they challenged the organisation. Almost all of them were under the influence of alcohol, and were sitting in a meeting with the forest ranger when Sail reached the village along with his colleagues to participate in the solidarity meet. A women's cultural action team of the Chattisgarh Mahila Jagriti Sangathan was also held to ransom by the goons of the forest ranger and were being abused and threatened till the subdivisional magistrate, Netam of Saraipalli reached the spot.

The Chattisgarh Mukti Morcha president and MLA, Janak Lal Thakur, has blamed the cabinet minister Vidya Charan Shukla for creating such a situation of terror as he intends to contest the Lok Sabha elections from Mahasamund. The ruling Congress (I) is jittery as the CMM commands a strong people's organisation in this constituency. According to rough estimates, this number is between 50,000 and 70,000, and can be the decisive votes in the forthcoming Lok Sabha elections. According to Thakur, the ruling party is attempting to use the forest, liquor and land mafia in the region to crush the people's organisation. Thus, the reign of terror is being created in the region, first by brutally attacking the key social and political workers, and simultaneously, disrupting the democratic processes and rights like meetings, rallies and demonstrations.

GURUCHARAN

Raipur

Dalit Patriarchy

READING Gopal Guru on 'Dalit Women Talk Differently' (October 14-21) mainstream feminist activists might well think that he is unnecessarily initiating a discourse of difference on dalit women. Dalit patriarchy too cannot accept his charges of discriminating on the basis of gender among themselves. They may hold him responsible for breaking their revolutionary agitation in which not only the issues but even the very presence of dalit women was

assumed. Yet neither force can absolve itself of the charges listed below: What have they done to the dignity of dalit women when they in broad daylight fell victim to upper caste male violence? Have they ever asked how a question of rape of dalit and adivasi women has to be tackled ideologically and legally? Have they really employed their energies to promote education, provide health care and create employment for dalit women?

DEV ATHAWALE

Akola

Mission Schools and Evangelisation

RUDOLF C HEREDIA's essay 'Education and Mission Schools as Agent of Evangelisation' (September 16) is stimulating and enlightening as is his objective in bringing out the contribution of the Christian institutions to educate Indian youth. One wonders why the writer has ignored the names of the prominent persons like Dr Radhakrishnan and the Arcot Mudaliar brothers who hardly hesitated to proclaim and boast that they attended the Bible classes where they were positively provoked to become better Hindus. The concluding portion: "Our educators... must also be the prophets, activists and witnesses for today" could have been more comprehensive than it is.

Regulating Medical Care

THE verdict of the three-member bench of the Supreme Court on the definition of service will quieten, for the time being, the din over whether the activity of providing medical assistance for payment by doctors and medical institutions comes within the purview of the Consumer Protection Act, 1986. But the battle has only been joined – it is the beginning of a long struggle for a humane and efficient health-care service.

The Supreme Court ruling was in response to a bunch of appeals filed by doctors and institutions in the private sector challenging the judgment of the National Consumer Disputes Redressal Commission in 1992. The court's decision sets aside the verdict of the Madras High Court which had exempted doctors from the purview of the act. The act, it may be recalled, gave rise to a spate of litigation in various high courts leading in due course to numerous appeals to the apex court. In addition, the Medical Council of India had challenged the provisions of the act, contending that medical practitioners were governed by the Indian Medical Council Act, 1956 and that the code of medical ethics was sufficient to regulate the conduct of the medical profession and to apply redressal measures. All this has meant that the health sector has remained outside the purview of the Consumer Protection Act for the last 10 years.

The Supreme Court has made a distinction between 'contract of personal service' and 'contract for personal service', maintaining that in the absence of a relationship of master and servant between the patient and the medical practitioner the service cannot be regarded as a contract of personal service. Dividing medical professionals and institutions into three categories, the court has held that the act is not applicable only where services are rendered free of charge to everybody. Where the service is charged for or where a section of patients are charged, the institution is liable for action. Similarly, medical negligence in cases where the service is paid for by an employer is also liable for action. In effect, except public institutions and those in such institutions, the entire range of medical professionals – practising allopathic as well as other systems of medicine – and institutions have been held to come under the purview of the act.

The implications of the verdict are wide-ranging. In effect it is the first significant initiative towards redressal of the rampant malpractice prevailing in the system. Notwithstanding the Medical Council's contentions in court, rarely has it been possible to obtain redressal through its offices. In fact, it is the utter failure of the council in monitoring medical practice which has made recourse to the act necessary. In other words, if today the medical profession feels a sense of humiliation at

having to accede to monitoring by the state, this is a reflection of its own inability to see the practice of medicine as a service and not a commodity to be sold for as high a price as can be extracted. The class divide that existed when modern medicine took root and has largely persisted here and in other colonised countries between those who can get access to medical education and those who cannot has ensured that the medical community has been the last post of the empire in most colonial countries. While there are some sections of the medical profession who see the Consumer Protection Act and the Supreme Court verdict as a new beginning, most reactions have a flavour of injured pride and threatened self-interest.

There are two relevant apprehensions about the act and its implementation, however. One, that the act will be misused since it is now comparatively easy to file a complaint and get a hearing and, second, that the current absence of minimum conditions of various kinds would lead to arbitrary and wrong decisions. The first is a genuine misgiving considering that only 20 per cent of the 3,94,000 allopathic practitioners are in government service and are safe from such actions. There are two possible situations which may arise: one, there will come about the kind of situation which obtains in, say, the US where malpractice insurance leads to high cost of medicare. The other scenario is that the Consumer Protection Act will be an effective deterrent and therefore a lever for reform within the profession. What actually happens will depend on how keen the medical community is to reassert its identity as a profession, governed by professional ethics and not entirely subservient to market forces.

It is a fact that the medicare sector is among the least monitored. While there are a total of nine lakh practitioners of all systems of medicine and there are bodies which register practitioners of each system, their lists, including those of the medical councils which register allopaths, are unreliable and remain unchecked for decades. Only two of the states, Delhi and Maharashtra, are known to have even passed legislation regulating nursing homes. In the latter state, the act is applicable only to four cities, Bombay, Pune, Sholapur and Nagpur. In other states there is no estimate of the number of nursing homes. Another factor which will affect the implementation of the act even more is the lack of accepted guidelines and minimum standards for health care institutions. In such a situation, deliberating on cases of negligence may mean evolving criteria which may or may not be entirely appropriate.

The terms medical negligence, medical incompetence and deficient service cover a range of actions, inaction and

outcomes. These should be expected to get clarified in the course of the processing of complaints. However, if the act is not to become a means of arraigining the medical community against those who seek its services, if it is to lead to upgrading of medical practice, to creating a more humane people-oriented system of health delivery, all the actors – doctors and medical institutions, the state and the patients, primarily the first two – need to redefine priorities. There is a grave need to regulate medicare; whether this is done through state legislation or self-regulation is in a sense immaterial for the large majority of the 'consumers'.

THE ECONOMY

Towards a Dead-End

AN IMF team in the country for Article IV consultations with the ministry of finance has, according to newspaper reports, let it be known that it takes an 'upbeat' view of the Indian economy and is satisfied especially with the way the finance ministry and the Reserve Bank have been dealing with the exchange rate situation. It must do the government a world of good to know that the IMF at least continues to be pleased with it, especially at a time when it is becoming obvious even to ordinary readers of newspapers that its much-vaunted economic 'reform' programme is rapidly moving towards a dead-end with confusion and differences among the principal economic policy-making agencies increasingly coming into the open. Even government spokespersons no longer try to conceal that the economic reforms have more or less ground to a halt, though they would like to suggest that, with elections to parliament due in a few months, this is no more than the unavoidable obeisance that has to be paid to political democracy. This is what the finance minister, above all, would like to be believed for the obvious reason that that would absolve him of responsibility for whatever is or is not happening. The truth, however, is that the impending elections are only one factor, and not even the principal one, in the emerging situation. Far more important are the limitations and the inherent problems of the so-called reform policies and the understandable lack of clear ideas among the reformers on how to deal with these.

How, for instance, can the publicly aired differences between the finance minister and the governor of the Reserve Bank on the appropriate ways of dealing with recent developments, which will no doubt be recurring ones, in the foreign exchange and money markets be blamed on the elections? The latter may share the finance minister's

optimism about the soundness of the economy's 'fundamentals' and his hope that the current account deficit in the balance of payments can be contained at the supposedly manageable level of 1.5 per cent of GDP, but the fact is that he considered it necessary to expend a not insubstantial chunk of the government's foreign exchange reserves to intervene in the market in order to forestall the possibility of a speculative run on the rupee – something which, according to the finance minister, was not warranted. The finance minister has apparently not taken kindly also to the Reserve Bank's decision to inject liquidity into the money market in the face of sky-rocketing call money rates for fear of stoking inflation. This has persuaded the governor of the Reserve Bank to draw pointed attention on more than one occasion in recent weeks to the government's uncontained fiscal deficit and to say without mincing words that the formal agreement setting very precise limits on the government's borrowing from the central bank – which he had himself at one time enthusiastically hailed as a landmark in economic management – was worth little if the government was unable to curb its appetite for borrowed funds in general.

The prize example of the confusion over economic policies is, however, the widely reported statement of the minister of commerce that to stabilise the exchange rate of the rupee it would be necessary to restrict imports to meet only 'the most important requirements'. Chidambaram also wanted exporters to be made to repatriate export earnings without delay. It is difficult to believe that the minister in charge of the country's external trade can be unaware that rapid liberalisation of imports and lifting of restrictions on movement of funds on the current account are articles of faith in the economic reform programme. About the same time as the commerce minister was making his extraordinary statement, the chief economic adviser to the finance ministry was admitting to his audience at a public lecture in Bombay that, yes, there was one important respect in which the economic reforms had been regrettably incomplete – import of consumer goods had not been made as completely free as they should be¹.

Against this background it is not entirely unexpected that reports have begun to be circulated that the finance minister may not after all present the budget proper on the due date next year, but would make do with a vote-on-account instead. Once again this has been sought to be explained in terms of the proximity of the elections, though from all accounts the government is yet to decide on the timing of the elections

which may well not take place before April or May or even June next. T elections apart, available information the trends in the government's expenditure and in its deficit, whether in the narrow or broader sense, leaves little room for doubt that the next budget will reveal further deterioration of the state of the government's finances. As it is, even succeeding budget of finance minister Manmohan Singh has been marked by the government's admission of failure to meet the target of containment of the fiscal deficit (of the revenue deficit, of course, the less said the better) and he has had to try to persuade the country that things were going to improve in future very soon. Once the facts of the government's finances in the current year come out, this too often repeated charade will finally lose its credibility. So elections or no elections, the attractions of a vote-on-account for the finance minister must indeed be quite irresistible.

PRICES

A Stalemate?

THE recent behaviour of prices does not conform to expectations based on trends in the relevant economic variables. The inflation rate as measured by the wholesale price index (WPI) touched a five-month low of 8.1 per cent in the week ended October 21, on the eve of the kharif harvest. Since then it has generally moved up to a six-week high of 8.6 per cent in the week ended November 4. Against the backdrop of a 10.4 per cent inflation in 1994-95, the rise in the WPI in the current financial year has been around 8 per cent now for about 27 weeks. The catch, of course, is that the seeming moderation in inflation this year is over the high base of the previous year. Actually, the price index has been continuously moving up.

Between October 21 and November 4, just two weeks, the WPI rose from 297.7 to 298.6. The index for 'primary articles' went up from 307 to 309.2 or by 0.7 per cent. Within this group, the index for 'food articles' shot up from 337.8 to 342.5 (1.4 per cent), that for 'foodgrains' from 312 to 315 (0.8 per cent) and that for cereals from 300.3 to 303 (0.9 per cent). Likewise the WPI for 'fruits and vegetables' has spurted from 331.3 to 339.9 (2.6 per cent) and that for 'eggs, meat and fish' from 397.9 to 405.1 (1.8 per cent). The steepest rise has occurred in 'other food articles' consisting of tea and coffee, from 428 to 457.5 or by as much as 6.9 per cent in the two-week period. The WPI for 'manufactured products' also showed an increase during this period.

While the rise in the general index of wholesale prices in the current financial year up to November 4 has been lower at 4.7 per cent (compared with the 6.4 per cent rise in the same period last year), prices of a large number of commodities have been rising continuously on top of the large increases last year. The index for 'food articles' has risen by 9.1 per cent on top of a rise of 11.9 per cent in 1994-95. Though seasonal, the rise of 78.4 per cent in vegetable prices so far this year has far exceeded the rise of 49.6 per cent last year. In tea and coffee the rise has been 24.5 per cent this year on top of a 49.8 per cent rise last year. But for the subdued price trend in some intermediate and capital goods, the inflation rate would have been higher still.

What is noteworthy is that the persistence of inflation is not warranted by demand and supply factors. In that sense the economy has not been allowed to derive the full benefit of eight consecutive years of good crops. There was a bumper crop in 1994-95 with foodgrains output touching a record 192 million tonnes – a 10 million tonne rise over the 182.1 million tonnes of the previous year. Though there was some initial delay, overall rainfall during the south-west monsoon this year has turned out to be as good as the best in recent years with 32 meteorological sub-divisions recording excess or normal rainfall and only three showing a deficit. All crops, except wheat perhaps, are expected to show a further rise in production over the peak levels of 1994-95. Food stocks with public agencies had touched an unprecedented 37.5 million tonnes by May and remained high at 32.5 million tonnes at the end of August. The official expectation is that GDP growth, which had accelerated to 6.2 per cent in 1994-95, will be as good, if not better, this year.

With monetary policy still guided by the goals of stabilisation, monetary growth has been moderate in the past two years, particularly after the slowing down, over a year back, of foreign currency inflows by way of portfolio investment and global depository receipts. M₁ growth in April-October at 5.4 per cent has been low compared to the growth of 7.8 per cent in the same period last year. Likewise, reserve money growth has decelerated markedly from 11.4 per cent in April-October 1994 to 4.9 per cent so far this year. A major contractionary factor has been the erosion of foreign exchange reserves by \$ 3.25 billion (the equivalent of Rs 11,000 crore approximately) since the beginning of the fiscal year.

Thus there is no sign of an imbalance in the demand-supply situation, in the aggregate or even sectorally. Yet the pressure on commodity prices has persisted. A major

part of the explanation has to be sought in the liberalised environment in which the trading community has been operating since the initiation of the economic reforms. The sharp increases in the procurement prices of rice and wheat have enlarged the holding power of the rich and even middle peasantry. Likewise, traders have begun to act in concert and demand of manufacturers that retail prices stamped on packages be inflated, with the threat that they would not market the products of recalcitrant manufacturers. The decision of the central and state governments to put the Essential Commodities Act in cold storage (even though they dare not formally repeal it) has clearly emboldened traders to pursue such tactics with impunity.

If the inflation rate has been hovering around 8 per cent this year and has not been higher, this perhaps reflects the emergence of a measure of consumer resistance after the persistently high inflation levels of the past five years or so. Niggardly growth of incomes of large sections of the population together with severe erosion of real incomes have dented aggregate purchasing power and something of a stalemate appears to be emerging in the commodity markets between the traders' urge to exploit the liberalised regulatory environment to extract higher margins and the consumer resistance emanating from sheer lack of purchasing power.

NIGERIA

The Executioners

IN the aftermath of the execution of the militant Ogoni leader Ken Saro-Wiwa and eight others after a military kangaroo court had sentenced them to death, it is easy to forget that among those who are most vocal in their condemnation are nations in whose not-so-ancient histories lie the roots of the present social and economic distress and decay of Nigeria and of many other African nations. The ingredients are all more or less the same, though the brew may turn out a little different at different times and places, some bad and some worse. Resource-rich regions peopled by numerous divided communities/tribes, colonisation and exploitation of resources, little or no effort to establish the basis for democratic institutions, de-colonisation and the legitimisation of the exploitation of resources in the name of development and in collaboration with local elites, disintegration of political systems, rampant corruption to facilitate the cornering of the new-found wealth, state repression, often through military dictatorships, suppression of dissent and the deepening spiral of violence. The list of African countries which

have been warned by the Commonwealth to restore democracy and respect human rights – Gambia, Sierra Leone, Kenya, Cameroon, Mozambique and so on – is a trail of the social, political and economic wastelands created by the individual and collective rapacity of the very nations which today condemn the military regime of Sani Abacha.

But understanding the nature of the crime or its history is not to condone it. Of the increasingly brutal actions of Nigeria's military junta this was perhaps the most brazen and inhuman. Saro Wiwa was the leader of the movement for self-determination for the 5,00,000-strong Ogoni minority from the southern oil-rich Niger delta. Interestingly the movement itself emerged around the issue of the environmental devastation wrought by the oil companies since 1954, for which the Ogonis began to demand compensation. Not having got a share of the oil cake at any time, in 1991 it became obvious that the cake itself was shrinking. Nigeria has one of the smallest reserves although today it is fourth largest OPEC oil producer and accounts for 7 per cent of US oil imports. Since 1954 several multinational oil companies have set up base and have been extracting oil and maximising profits with little interest in repairing or preserving the environment. All this has hardly benefited the Ogonis who remain the poorest of the over 300 tribal groups which inhabit Nigeria.

The Ogonis are not, however, the only ones targeted for repression by the Nigerian regime. Since 1994 at least 100 people have been publicly executed by firing squads. It is a measure of the reluctance of the Commonwealth countries to take action against the regime that before the execution of Saro-Wiwa they had accepted the Nigerian regime's timetable for restoration of democracy. Even after the execution, it is noteworthy, none of the countries are willing to put an oil embargo on Nigeria. What is more, Shell (UK) which leads a consortium planning to build a \$ 3.6 billion project for liquefied natural gas in Nigeria has been quite unmoved by the executions and has declared its intention to go ahead with its plans.

The suspension of Nigeria from the Commonwealth is a small step towards forcing a return to civil rule in the country. Some other actions may well follow. However, the solution does not lie in putting external pressure on the military junta to reform. The answer lies in a transformation of the character of geopolitics, which today necessitates the devastation of third world countries to feed the rapacious appetites of the industrial north. In the struggle for such a transformation, many more Saro-Wiwas are destined to be murdered.

GSFC

Rise in Sales

GUJARAT STATE FERTILISER COMPANY, promoted by the government of Gujarat in 1962, is engaged in the manufacture of urea, diammonium phosphate (DAP), ammonium sulphate, caprolactum, nylon filament yarn (NFY), melamine, nylon 6 and different types of polymers. It was the first company in India to set up a caprolactum plant in 1974. The company closed the financial year ended March 1995 with a sales turnover of Rs 1,482 crore, up by 38 per cent from Rs 1,076 achieved in the previous year. Total income stood at Rs 1,611 crore against Rs 1,156 crore in the previous year and would have been higher but for other income which decreased by 13 per cent. Interest costs moved up by 3 per cent. Provision for depreciation rose by 9 per cent and was more than offset by a 50 per cent decline in the provision for taxation. The company ended up with a net profit of Rs 114 crore, up by 187 per cent from Rs 40 crore recorded in the previous year.

For the year under review the company increased its capacity utilisation in both the caprolactum plant and the fertiliser units at Sikka and Vadodara, while its acrylic pellets and nylon plant managed to record new highs in production. A record production of 13.97 lakh tonnes against 12.86 lakh tonnes was achieved by the company's fertiliser plants. A major contribution came from the DAP plant at Sikka which achieved a production of 5.30 lakh tonnes against 4.19 lakh tonnes in the preceding year. The caprolactum plant produced 38,230 tonnes, achieving a 76 per cent capacity utilisation against 60 per cent in the previous year. Production of acrylic pellets stood at 1,478 tonnes. The production capacity has been further enhanced to 1,800 tonnes from 1,500 tonnes. Production of normal butyl-metha-acrylate (n-BMA) was 56 tonnes against the installed capacity of 50 tonnes. With the market showing signs of improvement, production is to be raised to 75 tonnes. The fibre unit achieved a production of 5,201 tonnes during the year under review.

Exports stood at Rs 66 crore during the year under review compared to Rs 26 crore in the previous year, an increase of 152 per cent. Imports at Rs 497 crore were up by 19 per cent from Rs 416 crore in the previous year. Export of caprolactum increased from 7,966 tonnes to 19,255 tonnes.

The company plans to build a new Rs 750 crore ammonia plant with a capacity of 1,350 tonnes per day. The plant will increase the company's urea production by 1 lakh tonnes to 4 lakh tonnes. The phosphatic fertiliser capacity would be raised from 50,000 tonnes to 3,50,000 tonnes with a part of the output being sold as liquid ammonia and a part

being converted into fertilisers. Indian Engineering Consultant have been taken on for the engineering work. GSFC has signed an agreement with KfW, the German bank, for a loan of 178 million DM to part finance the project. The company has also secured financial assistance of Rs 150 crore from leading financial institutions like IFCI, ICICI, LIC, UTI, SCICI. Also on the expansion agenda is the doubling of the melamine capacity to 10,000 tpa at the cost of Rs 120 crore.

The company has recently commissioned a 50 mw co-generation power plant successfully. The company is making a foray into the power sector with a 145 mw project in Vadodara at an estimated cost of Rs 4 crore in collaboration with Gujarat Alkalies and Chemicals and Gujarat Electricity Board. The company has also promoted Gujarat Airways along with the Gujarat government to operate flights to and from Bombay. The company is entering the liquefied petroleum gas (LPG) market and plans to market two lakh tonnes of LPG in a phased manner by June 1995 using its jetty at Sikka. Plans are afoot to lay an LPG pipeline in collaboration with the IOC at Jamnagar. The company will implement its gas cracker project at Bharuch to manufacture petrochemicals at a cost of Rs 4,300 crore and plans to complete the project in stages between March 1996 and 1998.

The company in association with Modi Rubber has signed an agreement with British Petroleum Company to set up a acrylite fibre plant at an estimated cost of Rs 700 crore. To finance this project the two companies plan to tap the market with a Rs 120 crore public issue and have jointly floated a company, Gujarat Acrylite Company. The company has joined hands with IPCL, GNFC and GACL to set up the first largest liquid terminal port in Dahej.

The company has signed a memorandum of understanding with the Uganda Development Corporation for setting up a phosphatic fertiliser project in Uganda and is awaiting the approval of the government of India.

The company plans to set up an export-oriented floriculture project in Gujarat and is negotiating with an Israeli firm in this regard. The company has also signed an agreement with Vogelbusch GmBH of Austria for setting up a 1,200 tpa citric acid project. According to H K Khan, chairman, the company would continue to be an agro-based company and had intensified its agricultural activities by increasing seed production, taking up improved agricultural practices and by introduction of new pesticides and tissue culture to benefit farmers.

The company has won an award for development and distribution of biofertilisers from the National Productivity Council, being the first fertiliser manufacturer in the country to be thus accredited.

ESCORTS

New Projects

Escorts, the flagship company of the Escor group, is engaged in the manufacture of motor cycles, tractors, auto component construction machinery and telecommunications. The company has a history of joint ventures. As early as in 1969 it set up a joint venture with Ford motors for the manufacture of tractors. 1984 saw the company enter into a collaboration with Yamaha for a technical assistance agreement to manufacture 100cc motorcycles in India. Three joint ventures were promoted by the company in 1992. Escorts Class was formed with 60 per cent equity with Escorts, the rest being held by their German collaborators. Hughes Escorts Communications, Escorts has a 49 per cent equity with Hughes Network Systems of US, a leading hi-tech electronics company, holding 51 per cent equity. The third joint venture was with Wimpey of UK to undertake construction projects including construction of roads, highways, bridges etc. The company in keeping with its first phase of restructuring has hived off all these divisions as separate companies, creating distinct business groups dedicated to clearly defined areas of activity.

Escorts closed the financial year ended March 1995 with a turnover of Rs 1,19 crore, up by 32 per cent from Rs 903 crore last year. Increased dividend and interest earnings saw other income move up from Rs 30 crore to Rs 53 crore, a rise of 76 per cent. Total income moved up from Rs 92 crore to Rs 1,253 crore. Interest costs came down by 16 per cent. A rise in the provision for depreciation by 6 per cent, coupled with a tax provision of Rs 20 crore from nil in the previous year did little to dampen the bottom line and the company ended up with a net profit of Rs 51 crore, up by 34 per cent from Rs 12 crore in the previous year. A dividend of 36 per cent has been declared by the company against 30 per cent last year.

In 1991-92, the company's performance suffered as a result of the general slump in the automobile industry. 1992-93 saw heavy interest costs take its toll on net profit. The situation eased in 1993-94 with sales increasing by 8.12 per cent and it got better in 1994-95 with the company selling 4.4 lakh motorcycles. The company hopes to touch the 5 lakh mark in the current year. Escorts has a 27 per cent share in the motor cycles segment with Bajaj Auto and Hero Honda being its main competitors in this segment. In the tractors segment, the company improved its market share to 11 per cent selling 16,498 tractors compared to 15,233 tractors in 1993-94. Exports have risen to Rs 28 crore registering an increase of 61 per cent over the previous year. The company exported products to Sri Lanka, Tanzania and Papua New Guinea.

The company has major upgradation plans on the anvil. It plans to introduce 30 HP diesel engines for the agricultural tractors and 4-stroke 128cc motorcycles for introduction in the near future. The Rs 200 crore investment in the tractor division will be funded entirely through internal accruals. In the motor cycle division an investment plan of Rs 600 crore is envisaged. In a bid to consolidate its position in the telecom industry, Escorts in a joint venture with Hong Kong-based First Specific has set up Escorte Mobile with an equity of Rs 400 crore with Escorts holding a 51 per cent stake in the venture. The company has entered into a joint venture with HMT for its tractor division with a 51 per cent stake with the remaining 49 per cent to be held by HMT. The acquisition is to provide a boost to the company's tractor sales, taking it to number one position from the current number three position.

The company has signed a memorandum of understanding with Yamaha Motor company of Japan to set up a Rs 200 crore joint venture company in India, with both partners having an equal stake in the joint venture. The company, Escorts Yamaha Motor, will manufacture a wide range of two-wheelers for the domestic and international markets. The joint venture which commences operations in April 1996 will lay stress on stringent exhaust norms laid down by the 1994 amendment of the Central Motor Vehicle Rules to come into effect in April 1996. Its manufacturing plans include the manufacture of environment-friendly two-stroke motor cycles. Future plans envisage four-stroke two-wheelers. Motorcycles manufactured by the joint venture is expected to grow from 1,30,000 in 1996-97 to 2,00,000 in about five years.

TATA TEA

Surge in Domestic Demand

Though tea is the major revenue earner for the company, contributing nearly 95 per cent of its turnover, Tata Tea with a 19 per cent market share has interests in other plantation crops like coffee, pepper, cardamom and other spices. The conditions in the tea market have been bleak for the last couple of years. The break-up of the Soviet Union has adversely affected the Indian tea industry. The erstwhile Soviet Union used to pick up around 200 million kg of tea which dropped to 42 million in 1994. Added to this has been the stiff competition posed by Sri Lanka and Kenya who have emerged as India's main competitors in the world tea market. Conditions have improved of late with the better price that Indian tea is commanding on account of its superior variety compared to Sri Lanka and Kenya.

Tata Tea closed the financial year ended March 1995 with net sales of Rs 397 crore, down by 4 per cent from Rs 415 crore achieved in the previous year. In these conditions the contribution of other income has been significant in providing the necessary boost

to the bottomline. Other income rose from Rs 20 crore to Rs 56 crore, a rise of 175 per cent. Interest costs came down by 7 per cent. Provision for depreciation rose by 3 per cent while there was a fall in tax provision to the extent of 32 per cent. The company ended up with an almost stagnant net profit of Rs 59.29 crore, up by less than 1 per cent from Rs 58.94 crore in the previous year. A dividend of 60 per cent has been recommended by the directors.

Total tea produced by the company was 54.21 million kg, 6 per cent lower than the production of 57.68 million kg in the previous year. Adverse climatic conditions prevented the south Indian estates from repeating the previous year's performance of 30.90 million kg and production stood at 27.28 million kg. The north Indian plantations division produced 26.93 million kg against 26.78 million kg last year. The company's sales of consumer packs registered an encouraging growth with the company's flagship brand Tata Tea registering a growth of 20 per cent compared to the previous year.

To combat adverse market conditions the company has decided to take the value added route with efforts being made to strengthen its brands. The low level of prices was a result of the changes in global markets over the last few years. The decline in Russian tea buying and the withdrawal of major buyers such as Iraq, Egypt and Iran led to a severe

compression in exports. However, the company moved on aided by the surge in domestic demand coupled with preference for quality teas.

The company is talking to the Madras-based Saptarishi Agro Industries which is into the cultivation of mushrooms for acquiring the company. Tata Tea has been in the mushroom business for about eight years now and its present capacity is around 1 lakh kg a year. A foray into the manufacture of ingredients used in bakery applications is being looked into. This is in addition to expanding its existing business of tea and coffee.

Europe and the countries of the Far East like Japan are the potential markets for the company's instant tea products. During the year under review, the company tied up with Hitachi of Japan for exploring opportunities in these markets. The joint venture is for identifying the markets for selling conventional and instant tea. Tata Tea has a 29 per cent stake in the joint venture called Tata Hitachi Sales (Japan).

The company is negotiating with Nutrasweet, a division of the US-based company Monsanto for a joint venture to manufacture sugar sweeteners and aspartame-based products in India. The two companies will hold a 50 per cent stake in the venture.

Consolidated Coffee (Conscoffee), a subsidiary of the company in which Tata Tea holds 52.4 per cent stake, is working on

methods for converting agricultural wastes such as coffee fruit skin, cherry and parchment husk and sawdust into enriched organic manure to improve the soil fertility of the coffee estates of the company. It is also examining emerging opportunities in the domestic and international markets to bring in a range of value added products. Conscoffee's strategy of holding down its prices in the face of rising prices in the domestic as well as international market enabled it to increase its sales and shore up its bottomline. The company registered an increase in turnover by 89 per cent and in net profit by 198 per cent and has declared a dividend of 60 per cent.

The company's 100 per cent export-oriented unit, Tata Tetley, a joint venture with Lyons Tetley, exports value added tea products like tea bags to the West Asia and Poland and operates one of the most sophisticated tea bagging facilities in the country. The Tata Spices centre in Cochin and Tata Tetley have been accredited with ISO 9002 certification.

The company in collaboration with Rallis India is undertaking a field assessment of high-yielding and disease-tolerant selections of coffee, cardamom and pepper for future planting. Through the adoption of wedge cleft grafting method the company has achieved a major breakthrough in tackling infected Arabica coffee areas.

The journal aims at providing a competent vehicle to disseminate the results of research in the field and to document innovative experiments directed towards developing entrepreneurship. The principal purpose of the journal is to provide an avenue for the publication of original contributions, both conceptual and empirical, and to serve as a vehicle for the fast growing literature on the theory and practice of entrepreneurship.

CURRENT STATISTICS

EPW Research Foundation

The shortage of liquidity is becoming acute. Bank deposits have grown by just 2.9 per cent so far in the current financial year compared to a growth of 1 per cent in the same period last year, whereas bank credit has gone up by 6.6 per cent against 4.1 per cent last year. Another major contributory factor has been the drawdown of foreign exchange reserves by \$ 3 326 million (about Rs 11 000 crore). Movements in the exchange rates of currencies of some major developed and developing countries present a mixed picture. The US dollar in which the largest share of India's trade and payments is denominated has depreciated since the beginning of 1995 as has the pound sterling, whereas the DM and yen have appreciated. Among developing countries, India's neighbours such as Pakistan have depreciated their currencies in terms of the dollar *pari passu* with the rupee or more. China effected a major one step devaluation in early 1994, but the currencies of some of the NICs such as South Korea, Thailand and Malaysia have been stable or have appreciated.

Bhopal Disaster: Judiciary's Failure

Satinath Sarangi

The aftermath of the Bhopal disaster demonstrates the incapability of the legal and judicial system to provide justice to the victims of industrial disasters and of the failure of the system to act deterrently against industrial/environmental crimes.

THE leakage of 40 tonnes of deadly chemicals from Union Carbide's pesticide factory in Bhopal, India has brought into the open leaks in the modern industrial society. In the aftermath of the disaster the biases and priorities of the medical, scientific and legal (and others) system were laid bare on many occasions. With over 16,000 people¹ dead to date and over 2,00,000 exposed persons suffering from incurable illnesses the Bhopal Gas Disaster has illustrated the horrors of peace time casualties of progress. Machinations of the multinationals, collusion of the Indian government, injustice of the judiciary, the fickleness of the media, and the systemic victimisation of the victims all this and much more, were made eminently visible without the usual verbiage and mystification that go on in modern society. The legal and judicial 'accidents' that followed the disaster culminated into the infamous settlement² between the Corporation and the Indian government, are of particular significance.

In the continuing aftermath of the judicial disaster claims of over 3,00,000 affected persons have not been registered and less than one-fifth of the people whose claims have been registered have received any compensation. Compensation sums being paid are humiliatingly low and obviously inadequate. The average compensation being paid in 5,325 cases related to death claims is Rs 93,000 (US \$ 3,000) and for personal injuries Rs 24,000 (US \$ 800). The procedures involved in the adjudication of personal damages are so tortuous that the claimants feel they are being treated as culprits. Meanwhile the real culprits, senior officials responsible for the continuing massacre in Bhopal are scot-free. Warren Anderson, the ex-chairman of the Corporation, and No 1 accused in the criminal case on the disaster, is hiding and Interpol says "they cannot find him".³ Despite the issuance of a non-bailable arrest warrant against him pending since March 27, 1992, the Indian government is yet to take the first step towards extraditing Anderson. The other accused officials, charged with manslaughter and other serious offences, are not even

required to present themselves in court as the criminal proceedings move ominously at the Bhopal district court.

Unfortunately, as we know, Bhopal is a part of our daily lives in technological society. Every year as many people die in the third world due to involuntary ingestion of industrial chemicals as those who died by Carbide's gases. And certainly the number of persons suffering from routine toxic exposure would be many many times more. As the world makes technological progress there are more profits in poisons causing more and more human and environmental damage. Bhopal demonstrated the incapability of the legal judicial system to provide justice to the victimised people and its failure to act deterrently against industrial/environmental crimes. However, Bhopal is no exception. Courts all over the world are more a part of the problem than the solution.

Law was brought into Bhopal by US ambulance-chasing lawyers who descended in hordes on the city within the first week of the disaster. Nearly 2,00,000 clients from among the traumatised people were made to sign⁴ on papers that went on to produce 120 separate legal actions. While popular sentiment underlined the need for punishing the culprits for justice to be done, the US private lawyers filed suits for damages worth several billion of dollars in US courts. The invasion of the US lawyers provided the Indian government with a rationale to pass the Bhopal Gas Leak Disaster (Processing of Claims) Act in the parliament in March 1985.

Empowered by the act the government arrogated to itself sole powers to represent the survivors in the damage litigation. Meanwhile it had set up a directorate to register damage claims of affected persons. The exercise lasted over three years and at the end of it, well over 1,00,000 affected individuals were left out. Claims of people under 18 were not registered and children born to gas-exposed women shown to be physically and mentally retarded through medical research, were not considered to be entitled to claim damages. The claimants were then medically examined (again 45 per

cent of them were left out were medically examined) and each individual was assigned a category of injury. Medical examination was carried out in a manner worse than the registration process. The three most important tests, viz, pulmonary function test, exercise tolerance test and ophthalmic tests were not carried out on over 80 per cent of the claimants who were medically examined. Injuries caused to the brain, reproductive and immune systems were not even considered for assessment. The results of the categorisation exercise are ridiculous and in sharp contradiction to research findings of the government's own medical research agency. Doctors employed by the directorate of claims, claim that 42 per cent of the claimants had not been injured at all, 52 per cent have only been temporarily injured and less than 6 per cent were considered to have suffered permanent injuries. While the government's Indian Council for Medical Research listed over 10,000 'burnt out cases' of people with severe lung disabilities,⁵ only 40 claimants in all of Bhopal were kept in the severest category of injury. Obviously the damages were under-assessed to suit the settlement amount. And currently in Bhopal this grossly faulty categorisation has become the overriding criterion for determination of compensation. In the recently-held 'Lok Adalat' (People's Court) nearly 3,000 claimants were awarded compensation sums in one day. On an average less than two minutes were given to individual claimants to present their case and claimants were, made to sign on papers saying that they agreed to whatever compensation was given to them before the compensation was decided. On an average claimants from the most severely affected wards⁶ who will be sick all their lives, were paid an average sum of little over Rs 25,000 (US \$ 800), an amount that falls far short of the even cost of medicines for the next five years. There is a system of appeal but it can take more than three years till a decision is made on the appeal (and no interest is paid on the original amount) so most claimants are coerced into taking whatever meagre amount is being given to them. All told it is a macabre judicial farce that would be funny if it were not so deadly cruel.

What does all this tell us about what law and the judiciary does? Particularly with reference to industrial hazards. In Bhopal the following legal/judicial steps followed a usual pattern. The first step was to reduce the human damage, the ethical and moral obligations, to payment of money. Once that was done damages were arbitrarily assessed (and given the enormous lack of information on chemicals and their effect, assessments

will always be arbitrary) and the money reduced. Consequently a large number of affected persons were denied any money and others are being given sums that will not even pay for their medicines. It is interesting to see what has been the effect of all this on the victimised.

The assignments of widely different injury categories to different individuals in an affected family or community has created dissensions among people within a community. There is a lot of anger among individuals whose injuries have been categorised as temporary or non-existent. But instead of being directed against the agencies responsible for the situation the anger of such individuals is directed against their neighbours or family members who have been assigned more severe injury categories. The arbitrariness in the award of compensation sums has thus further compounded the tragedy and the communal life of the survivors has been irreparably damaged. At an individual level the entire process of damage estimation to compensation award has been a humiliating experience with considerable loss of dignity.

Unfortunately the re-victimisation of the victims by the legal and judicial system is not unique to Bhopal. Particularly with reference to industrial/environmental hazards this is a sad but familiar story. As in Bhopal, payment of damages have marginal deterrent effect, if at all.

Of the money paid as settlement by Union Carbide, \$ 220 million was paid out by the insurance companies and the rest had earlier been set aside in the company accounts right after the disaster. The 50 cents per share that the disaster cost the company is unlikely to prevent its recurrence. Of course even if heavy damages were paid in the cases deterrence would hardly have been achieved. The global empire of hazardous corporations is sufficiently well organised to survive normal disasters in their routine operations. As it happens, insurance companies act as a buffer (payment of premiums hardly affect the corporation's profit margins) and damage litigation has no way to stop the human and environmental damage wrought by these corporations.

In sum then what does civil law do in response to industrial/environmental hazard situations? It legitimises the payment of money to recompense human and environmental damages (often irreparable) through an immoral logic. The judiciary then sanctifies negotiations in which the actual victims have little say. Compensation amounts are arbitrarily (and often adversely) adjudicated leading to frustrations and divisions within the community of victims and humiliation of the suffering individual. What civil law does not do is take a wee little step to stop the poisoning of the people and the planet.

However, there are spaces within civil litigation on industrial/environmental hazards that require legal and judicial intervention. To start with compensation needs to be seen not as a waiver against liabilities but as costs to be paid for reparation and restitution. In the particular case of Bhopal, these costs include cost of medical care, economic, social and environmental rehabilitation. A government colluding with the offending corporation, lack of information on the chemicals and the inadequacies of available technologies for the assessment of injuries often comes in the way of the proper estimation of such costs. National and international non-governmental initiatives could play a crucial role in an independent assessment of the human and environmental damages and estimating the costs of repair and restitution. In the case of Bhopal, the International Medical Commission on Bhopal composed of 14 medical specialists from 11 different countries was a commendable initiative in this direction. Critical interventions in this area will also include working out ways of victim-friendly payment of the monies received. Of course all such interventions and their outcome will be dependent upon mobilisation of public opinion.

The history of criminal litigation on Bhopal has not been very exemplary either. A criminal case on the gas disaster was registered on December 3, 1984. On December 1, 1987, the government's

prosecution agency the Central Bureau of Investigation (CBI) pressed charges in the Bhopal District Court against Union Carbide Corporation and its Asian and Indian subsidiaries as well as nine senior officials including the then chairman, Warren Anderson. The 12 accused were charged under sections of the Indian Penal Code that death with culpable homicide, causing grievous hurt, causing death and poisoning of animals and other serious offences punishable by up to life imprisonment and fines. Initially the accused corporation and officials blamed a fictitious saboteur ('a disgruntled worker') for the disaster and media campaigns were managed by public-relation companies to spread this lie. Meanwhile the CBI, with the co-operation of the workers of the factory, had presented a strong case that linked key managerial and technical decisions made by senior officials to the disaster. As the proceedings in the Bhopal District Court began, Union Carbide Corporation and its officials refused to come to the court, with the company spokesperson Erle Slack saying that "Indian courts had no jurisdiction over Anderson or the company". Anderson was served summons through Interpol and on his repeated refusal to obey them was proclaimed an absconder on February 9, 1989 by the chief judicial magistrate in Bhopal and directed to be present in court in six weeks time. On February 14, the US authorities intimated their approval of CBI's request to inspect

GLOBAL TRENDS IN LIBRARY AND INFORMATION SCIENCE

SUBHAS C. BISWAS

Comparative librarianship as a topic has drawn considerable attention within the profession over the last few decades. This volume brings out the anguish and concern for the gaps which exist between the developed and developing countries and to focus on the efforts being consistently made by the professionals belonging to the less developed world over the last decade.

Subhas C. Biswas a distinguished information scientist of India, has retired as Librarian at Central Secretariat Library, New Delhi.

the West Virginia factory of Union Carbide, a factory similar to the one at Bhopal but with much superior safety systems. The inspection by CBI was crucial to establish double standards of safety followed in the two 'sister-factories', a policy common followed by transnational corporations.

However, as part of its order on settlement on February 14, 1989, the Supreme Court went beyond its jurisdiction (as well as away from established procedures of criminal justice) and quashed the criminal proceedings against the Corporation and its officials. Indeed had the settlement not been challenged by survivors and their sympathisers that would have been the end to the criminal prosecutions of one of history's biggest mass murderers. The revised and final Supreme Court order of October 1991 revoked the criminal immunity granted to the accused, an act the Corporation termed 'unfortunate'. Following the resumption of criminal proceedings, a non-bailable arrest warrant was issued against Warren Anderson and the shares of the Corporation in its Indian subsidiary were attached. Anderson moved to a secret address and despite the attachment orders of the district court the corporation has been successful in selling off its assets through a Supreme Court order on February 14, 1994. Three years have passed since the issuance of warrants against the accused Corporation and its officials, yet the Indian government has not taken any step towards seeking Anderson's extradition from the US. The political will of the government being decisive in the criminal judicial process and given that the government has always followed a pro-Carbide policy, the chances of the accused being deterrently punished are indeed marginal. In the pressing of charges, conduction of investigations and collection of evidence, the CBI and the Indian government have been wilfully negligent. Senior Corporation officials liable for disastrous decision-making and government officials responsible for negligent monitoring and regulation have been left out of the list of accused. Charges that should have been pressed against the Corporation for crimes such as withholding of vital medical information, causing contamination of groundwater and soil in the vicinity of its factory with carcinogenic chemicals, have not been pressed. The investigations by the prosecuting agency have been marked by inadequate monitoring of death and disease, and the CBI is no longer interested in inspecting the west Virginia plant.

Nearly 11 years after, the century's worst industrial crimes remain underinvestigated, unjudged and the culprits unpunished. Again this failure of criminal law is not unique to Bhopal. The tiny number of convictions in cases of industrial homicide and grievous bodily harm, when posited against the

frequency and toll of these crimes, speak of the injustices committed against victims of such crimes worldwide.

Bhopal has clearly shown that legal/judicial response to corporate crimes is critically dependent upon the government's role in conduction of investigation, collection of evidence and enforcement of court orders. Though there exist provisions in some national laws (as in India) for extra-governmental criminal litigation against corporations and their officials, the resources required to sustain such a litigation are prohibitively high. On matters involving transnational corporations, enforcements of judicial orders are entirely dependent on the governments of the countries involved and extra-government initiatives are excluded. Yet another problem is the way criminal law and the judiciary look at corporations. Having no corporeal entity, corporations cannot be imprisoned or hanged. Senior officials who personally benefit from the consequences of the corporate decisions can thus stay behind the 'corporate veil' whenever they wish to escape liability for the injuries and/or deaths caused as a result of their managerial decisions. Fines extracted from the corporation – and the cases in which this has actually happened are rare – have little deterrent effect on corporate crimes, similar to the situation in civil litigation the elaborate insurance system annihilates the deterrent effects fines could have. Reduced to monetary terms the hazardous consequences of corporate decisions are easily managed and though their human toll are often large, profits of the corporations (and dividends paid to shareholders) are hardly affected as a consequence of reckless corporate policies.

While the inadequacies and inappropriateness of existing legal/judicial responses to corporate crimes require theoretical and policy level interventions critical engagements are possible within the existing scenario. In Bhopal, extra-government initiatives such as investigations into the causes of the disaster by such organisations as the Delhi Science Forum, Union Research Group, Bombay and the International Chemical and Energy Federation have generated facts and arguments outlining the specific crimes of the corporation. The complex nature of hazardous technologies may often require specific expertise unavailable in the local situation independent technical/scientific investigations in the establishment of corporate criminal liability could be one of non-government international interventions.

However, the major emphasis in dealing with corporate crimes will have to be, under the circumstances, in the domain of public opinion mobilising and creating means to exercise popular control over corporate conduct. An International Court for

Environment could examine cases for an International boycott of products of specific corporations. There are a but few instances of successful boycott campaigns against corporations but enough to suggest that they are an effective means of regulation of corporate behaviour. An aspect often overlooked in the initiation of boycott campaigns is the effect of such campaigns on the workers whose jobs and destinies are linked with the profits made by the corporation.

The other possibilities of effecting deterrence with regard to corporate recklessness is to hold public trials of corporations and their senior officials. Pressure would then have to be brought upon accused corporations and their officials so that they face popular charges in this international forum and comply with the decisions. While this may seem to be too ambitious and an unrealistic suggestion, it takes into account the vulnerability of mighty corporations *vis-a-vis* popular opinion. The specific roles and responsibilities of individual officials in the omissions and commissions of the corporation will have to be examined and grounds for appropriate popular actions laid down by an international forum. Of course such international interventions will have to be simultaneous with and supplementary to the local/national initiatives through existing and judicial systems.

Notes

- 1 The actual number of people killed by the disaster will probably never be known thanks to the government's deliberate neglect in monitoring and registering deaths. Official figures of exposure-related deaths is 5,324 till December 1992, unofficial and more correct estimates are at least three times more.
- 2 Through the settlement order of February 14-15, 1989, Union Carbide Corporation was absolved of all past, present and future liabilities on payment of a sum of \$ 470 million (one-seventh of the amount claimed by the Indian government on behalf of the victims), criminal proceedings were quashed and the Indian government agreed to defend Union Carbide in the event of future disaster-related litigation.
- 3 According to a pro bono investigation agency in the US, Anderson is currently living at 400 Beach Road, Vero Beach, Florida, US.
- 4 The retainers entitled the lawyers to 30-50 per cent of the damages as contingency fees. But most clients were ignorant of this arrangement as the forms were in English.
- 5 According to one study by this agency 98.4 per cent of the sample population suffered from lung injuries leading to exertional dyspnoea, 73.4 per cent had recurrent respiratory infections and 24 per cent had reactive airways dysfunction syndrome.
- 6 Of the 5,500 claimants who were called to the 'Lok Adalat' only 2,800 chose to accept compensation.

UP: Opportunity for the Left

Amaresh Mishra

With social polarisation favouring SP-BSP suffering a setback, Mulayam Singh's revival in UP depends on his aligning with Janata Dal and the left forces.

THE belated dissolution of the Uttar Pradesh (UP) assembly by the governor, Motilal Vora, may have ended temporarily the political uncertainty in the state. But its timing and methodology leaves no room for doubt that the state is again being held to ransom by contending forces through the misuse of office. The unprecedented decision to keep the assembly in suspended animation, once the BJP had withdrawn support from the BSP government, was in itself a partisan act aimed at furthering the interests of the Congress and to see whether any favourable power combination can be worked out in UP. When it became clear that no party was in the actual state of forming the government, and more importantly that the Congress will have little to gain by an unstable government of either Mulayam Singh or the BJP, the revocation of the house was effected, mainly, at the behest of the prime minister. But for quite a few edgy days, there was a virtual state of anarchy with parties claiming the support of members more than the actual strength of the house. Horse-trading, threats of political violence and factious discord also hung like a shadow on the fragile environment of the state.

In this, major parties like the BJP and the SP played a dubious role. Both demanded dissolution and holding of fresh elections but were soon involved in all sorts of legal-extra legal means in order to form a government. They also tried manipulating the position of the Congress for this purpose and at one stage both the BJP and the SP were hopeful of getting the support of the governor. The BSP for its part, was faced with the threat of a virtual breakup with its MLAs showing an inclination to join whichever party appeared close to power. The level to which political propriety sunk for a few days in UP is indicative of the scenario that might unfold in the coming days, which promise to be no less unstable than the previous ones.

The run up to the crisis was no less interesting. Of late, the BJP had begun feeling that continuance of support to the Mayavati government was not yielding the desired result. The BJP had a tacit understanding with the BSP wherein both stuck opposite postures only to climb down later, as seen in the episodes of Mathura, reservations to

backward Muslims and the Periyar Mela. But this alliance of convenience had begun showing cracks, especially with the reported bid of Mayavati to emerge as a powerful figure in her own right. This had brought her into conflict with the state leadership of the party, even as she enjoyed a cosy relationship with the central leaders. Division in the BJP had increased which was reflected in the elections to the post of the state chief where the Kalyan Singh backed nominee, Kalraj Misra prevailed over a BJP leader from Mirzapur who had had the presumed backing of the central leadership. On the other hand, Kanshi Ram's tilt towards the Congress and his politically motivated anti-BJP statements were causing anxiety at the central level. Moreover, the nominations to the upper house, the vidhan parishad had become due and it was feared by the BJP that Mayavati will use the opportunity to get herself nominated and then demand a dissolution in the hope of continuing as a caretaker chief minister till the next elections. This would have been disastrous for the BJP; what is more, the party wanted some of its nominees in the list of the vidhan parishad nominations to which Mayavati was not willing to accede. Apparently, the former chief minister had decided to pursue her political ambitions without the BJP for the time being; though there are reports that Kanshi Ram too, in order to forestall Mayavati's swearing in as a caretaker chief minister, instigated the BJP to withdraw support. As it is, opportunist convenience, rather than a minimum understanding on issues, was the bedrock of the BSP-BJP alliance which came off precisely, at an 'opportune' moment.

Contrary to media speculations, however, the withdrawal has not done the expected harm to the BJP. It was argued that the upper castes are angry with the BJP, first, for supporting the BSP and then withdrawing at the wrong juncture, and this would result in a shift towards the Congress. But the BJP, at present, has not lost much, though it is unclear how much it has actually gained. The marginalisation of Mulayam Singh could not proceed beyond a point and it is clear that a mere weakening of the dalit-OBC agenda is not sufficient to constrict the anti-BJP space which is the main strength of

Mulayam. The Congress is hoping to garner some upper caste votes from the BJP and a few dalit votes from the BSP. But this possibility has yet to assume any concrete shape; the speculations regarding the Congress are centring more around a pact up between Narian Dutt Tiwari and Narasimha Rao which might boost up the party.

The party which lost out heavily in the latest bout of UP politics was, of course, the BSP. It has ended up divided, faction ridden and a rump of its former self. The outcome has been a logical culmination of the BSP's journey which began from shrill anti-brahminism without a radical ideology of political and social transformation, went over to an alliance with the political agents of brahminism and finally degenerated into 'neo-brahminical' mess of vested interests, sleaze and corruption. There are charges of unprecedented swindling on the Mayava government and many contractors have openly spoken about payments to the former chief minister. Funds were also misappropriated through pressures on the private sector, diversions from the welfare schemes and transfer of officers. In the latter mentioned instance, which saw the former chief minister transferring a record number of IAS and IPS officers, a precedence of sorts was established as regards favouritism and corruption.

The balance sheet of the Mayava government is a sullied one, indeed. It was a regime which turned everything, even its own utterances, into their opposites. The much trumpeted offensive against the 'goonda raj' of Mulayam Singh ended in the limelight offered to the noted criminal of Ghazipur, Mukhtar Ansari, who addressed a major BSP rally with Mayavati a few days before the dissolution. This gesture also undercut all measures of the government aimed at 'ameliorating the lot' of the Muslims: here Mayavati was following the tried game of ruling class politics with subtle communal overtones: first, criminals are projected as leaders of the Muslims, and then, the community is subjected to harassment and repression on this very name. Developmental work was neglected to a point where money was siphoned off to unproductive and suspicious channels. A talk of law and order collapsed in the face of rising communal violence, unspeakable cruelty on children and women, and the rising graph of rape, murder, dowry death and atrocities on weaker sections. The second woman chief minister of UP had almost nothing to offer to the oppressed lot of the womenfolk; the CBI was actually denied permission to persecute the guilty officers who perpetrated the killings and rape.

Uttarakhandi women at Muzaffarnagar. For the poor and the underprivileged, a welfare scheme for even populist purposes was not announced and the issue on which relations with Mulayam Singh were broken, the failure to provide security and land to the dalits, was not pursued. Instead, the forces who raised the issue were dealt with a heavy hand. The Mayavati government showed, like no theory or write-up could have, that the dalit phenomena in UP, unlike Maharashtra or Tamil Nadu, has basically been a phenomena of power politics. It has been led, not by a reform-minded petty bourgeois intelligentsia, but by brokers and political agents of the dominant landlord-bourgeois-brahminical ideology. Lastly, it has functioned, crucially enough, as a weapon in the hand of ruling classes to blunt the edge of the left movement, class politics and democratic consciousness in the region.

With the sidelining of the BSP, the stock of Mulayam Singh is expected to rise once again. But it is clear that 1993 is not going to repeat itself: the social polarisation seen then in favour of the SP and the BSP is over and done with. The dalit-backward-Muslim unity is split along several lines with the disenchantment of the dalits with the BSP showing little signs, as of now, of getting translated into votes for Mulayam Singh. A revival of Mulayam Singh, therefore, can only be achieved by a radicalisation of the 'centrist plank' on which this 'unity' was achieved, or a return to the old centrist politics of the pre-93 days. Till now, the SP leader has shown little inclination of following the earlier option: renewed efforts to forge an alliance with the Janata Dal and the left parties seem more probable. Within the former, Mulayam is more keen on forging an understanding with Ram Vilas Paswan and his Dalit Sena in order to fill the gap created by the BSP. Even otherwise, the JD is reduced to a small force in the state and Mulayam has never been 'principled' or foresighted enough to seek unity for ideological and larger political reasons. His immediate concern is UP and he is unlikely to toe the National Front tag merely because it will send a different message at the national level. But the left tag will definitely help: it is quite interesting that even in a state like UP, where the left has traditionally stood weak in the electoral arena, its ideological and movemental appeal has been quite strong, something which the centrist parties have always tried to use. This has also constituted one of the 'sorrows' of the left which have yet to, it seems, leave the desired impression on the conventional wing of the movement. Even before the current crisis, the CPM openly, and the CPI covertly, extended

unconditional support to Mulayam Singh while the socialists linked to Mulayam were demanding some form of an apology from him for misdeeds committed in Uttarakhand and on other fronts, while in power. The left also overlooked Mulayam's history of breaking up the CPI and his indulging in anti-leftist propaganda.

The left, it appears, is failing to read the ground situation. Previously, Mulayam could go alone, but now he is dependant on the left. Moreover, with the failure of shrill, 'caste-oriented' centrist plank, the focus is back on secular issues which will naturally favour the left. Now, if the left, despite its 'weakness' (after all even Mulayam is quite weak now compared to his earlier strength), chooses to evolve an agenda of land reforms, democratic rights, unemployment, secularism, Uttarakhand and a radical change at the social level which will really empower the downtrodden, it stands a good chance of effecting a new anti-BJP, anti-Congress polarisation with an independent leftwards tilt. This might as well force Mulayam to take a different position or to support the left.

Amongst the left parties, the CPI-ML has taken up this position. Just before the dissolution of the assembly, it organised a 10,000 strong east UP peasant rally at Benares. Before that, the CPI rally at Allahabad and the CPM rally at Lucknow had both attracted less than 5,000 people. Even at other places, like Pilibhit, Faizabad and Unnao where the CPI ML organised Terai, Avadh and Bundelkhand based peasant

marches, respectively, the mobilisation was beyond anything achieved by the left so far. These indicators are quite interesting for they show that in quantity too, the revolutionary left trend is slowly edging past the CPI and the CPM. This can be of far-reaching consequences in the long run, though the main newspapers of Benares, belonging mostly to the Congress, the BJP and the Mulayam 'think-tanks' and money bags, highlighted the east UP rally as significant also in the immediate electoral scenario of the region.

A very noteworthy aspect of the rally was the focus, after many decades, on the issue of land reforms (even by government estimates UP has 1,59,000 acres of surplus, undistributed land, though unofficial figures are much higher) and its link up with the political situation of the day. Normally, these two are seldom linked; in the traditional left agenda, land reforms have functioned basically as an economic issue whereas political postures have had little bearing with the struggles of the peasantry. The CPI-ML's rally was a peasant march on the issue of communalism, it sought explicitly to link the struggle going on around 10,000 acres of unaccounted land in the Baurah farm of the Raja of Benares with the fact that in the east UP countryside upper caste landlordism has taken on a communal character. Thus, the class basis of communalism stands exposed along with the objective, political target of the land struggle, linking the fight of the rural poor with the fight against the BJP.

Agricultural Economics Conference

The 55th Annual Conference of the Indian Society of Agricultural Economics will be held at the Institute of Rural Management, Anand (Gujarat) from 23rd to 25th November, 1995. The following subjects have been selected for discussion at the Conference.

1. Livestock Economy
2. Rural Non-Farm Employment
3. New Economic Policy and Indian Agriculture

Montek Singh Ahluwalia, Finance Secretary, Government of India, will inaugurate the Conference and M V Nadkarni, Professor and Head, Ecology Economics Unit, Institute for Social and Economic Change, Bangalore, will preside over the Conference.

Geopolitics of Communicable Diseases

Plague in Surat, 1994

Sharat G Lin

Highlighting the occurrence of plague in a stereotypically poor country like India has the effect of setting the industrially-developed countries above the seemingly 'chaotic' and 'substandard' conditions of the developing countries.

A YEAR after the epidemic of plague that swept through Surat, its origins are still not clear. What is clear is that the international attention it received was driven not so much by genuine public health concerns, as by a media opportunity. When international press reports first carried news of plague in India, it was not of the outbreak of plague itself, but instead of the panic exodus of an initial 2,00,000 people from the industrial city of Surat. That was on September 23, 1994. But just the month before in August, officials had reported an outbreak of bubonic plague in 25 villages around the town of Mamlu in Beed district at the periphery of the Latur earthquake zone in southern Maharashtra. Among some 90 diagnosed cases, there were no deaths and no international panic. Similarly, when 80 children died from encephalitis in June 1995 in Muzzafarpur, Bihar, the event passed virtually unnoticed.

In Surat, the first diagnosed case had been reported days before the first confirmed death from the plague on September 21. The mere fact that plague had broken out in the pneumonic form and posed a risk of spreading to epidemic proportions was not in itself as great a concern to the world community. It was not until after the media drama of the mass exodus began that the *New York Times* carried a front-page article, first reporting the outbreak of plague in India. Focusing on the panic, it stated: "As many as 2,00,000 people fled the city of Surat in western India today after an outbreak of pneumonic plague that medical experts described as one of the most serious reported in the world in recent decades, officials have said"[1].

Once brought to world attention, the public health threat was dramatised by portraying this outbreak of plague as the recurrence of a previously extinct disease: "The epidemic of pneumonic plague in India that has led to panic and mass evacuation from the industrial city of Surat over the last week is a grim reminder that diseases commonly thought vanquished remain an immense threat to the world"[2].

This notion of a sinister global threat was amplified by referring not to the disease caused by the bacterium *Yersinia pestis*, but rather to the narrower categorisation of a specific and less common clinical presentation of the disease – pneumonic plague. The *New York Times* called it "the

first epidemic of pneumonic plague anywhere since early in the century"[3]. A second article in the same issue repeated the assertion, saying that the plague attack is "believed to be the first confirmed incidence of pneumonic plague anywhere in the world for decades"[4].

ONE DISEASE, MANY CLINICAL FORMS

The natural host of *Y. pestis* is domestic and wild rodents. Transmission is usually via a flea vector – in Asia most commonly the rat flea *Xenopsylla cheopis* – to other rodents and occasionally to human beings. Humans, dogs, cats, rabbits, and other non-rodents are accidental hosts in the natural life cycle of plague[5].

Bubonic plague is the initial form developing after the bite of an infected flea, with a usual incubation period of one to seven days. It is the more common form in humans, with abrupt onset, fever, enlarged tender lymph nodes (buboes) and abdominal pain.

Secondary pneumonic plague develops a fever, rapid breathing, cough, and pneumonia within two to three days after the initial symptoms of bubonic plague. This infectious stage enables human-to-human respiratory transmission and direct acquisition of the pneumonic form – primary pneumonic plague. If not treated with antibiotics within a day of onset, primary pneumonic plague may progress to marked difficulty in breathing (dyspnea), bloody sputum, respiratory failure, and death within two to six days of initial contact[5, 6].

Thus pneumonic plague is not a separate disease, but rather a more contagious form of the same disease as bubonic plague. Bubonic plague is an infection localised in the blood stream and in lymph nodes. Pneumonic plague is, in addition, an infection of the lungs, which becomes its primary manifestation. For epidemiological purposes, the World Health Organisation (WHO) classifies both bubonic plague and pneumonic plague as one disease. Its International Classification of Diseases (ICD-9) groups all clinical forms of plague under the code 020[7], since they are caused by the same organism and are inter-transmissible. In other words, a person with bubonic plague can develop pneumonic plague once *Y. pestis* bacilli cross from the blood circulation into

the alveolar tissue of the lungs. Conversely a flea having bitten a person with pneumonic plague can transmit *Y. pestis* bacilli to infect another person with bubonic plague.

The third clinical form, primary septicemic plague reaches overwhelming sepsis before lymphatic or pulmonary manifestations dominate. If untreated, it progresses very rapidly with fever, chills, rapid heart rate, nausea, vomiting, delirium, and death within 48 hours. The fourth form, plague meningitis, is a rare late complication when bacteria cross the blood-brain barrier.

GLOBAL INCIDENCE OF PLAGUE

According to WHO surveys, plague is endemic in Vietnam, Myanmar, India, Indonesia, Zaire, Kenya, Tanzania, Lesotho, South Africa, Madagascar, Libya, the US, Brazil, Ecuador, Peru and Bolivia[5, 6, 8]. In 1992, the latest year for which comprehensive data were available from the WHO, nine countries reported 1,768 cases, of which there were 198 deaths (11.2 per cent). During 1978-1992, a total of 14,856 cases, including 1,451 deaths (9.8 per cent), were reported in 21 countries[9]. The largest previous epidemic in modern times was of over 5,800 cases of plague in 1967 in Vietnam, generally recognised to be an anomaly owing to the disruption of the rodent population by extensive chemical defoliation by large-scale US military operations during 1966-69. In Southern Vietnam, 86 per cent of all cases occurred in provinces which were heavily defoliated[8]. Thus, contrary to the impressions given in western press reports, plague worldwide was far from being an extinct disease prior to the outbreaks in Mamlu and Surat.

In India, plague is not only endemic, but historically has been epidemic. An estimated 10 million deaths have been attributed to plague in India during the 19th century[5]. In 1953, 78 per cent of all reported human plague cases in the world occurred in India. Cases of plague in India have been reported in nearly every year during the first two-thirds of this century. Between the outbreaks in June 1969 and August 1994, both in Beed district, Maharashtra, the country had been largely free of the disease[8]. In fact, prior to 1994, the last laboratory-confirmed human case in India was reported in 1966[9]. This fact undoubtedly contributed to the erroneous popular notion that plague was a vanquished disease in India prior to the epidemics of August and September 1994.

By limiting the clinical form under discussion to pneumonic plague, the *New York Times*' assertion that this is "the first epidemic of pneumonic plague anywhere since early in the century" avoids comparison to later bubonic plague epidemics, such as the one in Vietnam in 1967, and ignores the current prevalence of isolated cases of pneumonic plague. Even in the US among

the 10 confirmed cases of plague reported to the Centres for Disease Control and Prevention (CDC) in 1993, one was primary pneumonic, seven were bubonic, and two were primary septicaemic (including one death)[11]. Among the 11 cases in 1992, one was fatal primary pneumonic plague and the rest bubonic[12].

Thus, far from vanquished, pneumonic plague still occurs around the world - even in an industrially-developed country like the US. Even though dramatic progress had been made in bringing plague under control during the first half of this century, the number of cases in the US has been generally increasing in successive decades during the latter half of the 20th century as shown in Table 1 [11, 13-15]. Then why did the *New York Times* attempt to erroneously portray the plague as a "once vanquished disease" when panic struck Surat? There are several possible contributory explanations.

'HOLIER THAN THOU' ATTITUDE

First, the word 'plague' conjures up in the minds of most people nightmarish vision of the 'black death' as it came to be called in the 15th century when a catastrophic epidemic of the plague wiped out an estimated one quarter of the entire population of Europe. It portrayed as the first epidemic of pneumonic plague since early in the century, the drama is elevated from an almost routine notifiable public health problem to a once-in-a-century outbreak of a killer disease.

Secondly, highlighting the occurrence of plague in a stereotypically poor country like India and not in the US, where it is equally endemic and, in fact, on the rise, has the effect of setting the industrially developed countries above the seemingly 'chaotic' and 'substandard' conditions of the developing countries. This provides the pretext for developed countries and some newly industrialising countries as well, to impose travel restrictions against the spread of plague from India. But this is more likely a euphemism to embarrass a less developed country in the hopes of making the more developed look better and safer.

Sure enough, on September 24, 1994, US federal health officials announced that they planned to increase surveillance at international airports in the US to 'identify any cases among passengers coming from infected areas of India'[3]. Other countries - including Saudi Arabia, Kuwait, UAE, Malaysia, Germany - followed suit, taking still stronger actions to cut off or restrict flights from and to India. Some warned their citizens not to visit India. Of course, Pakistan lost no time to use the opportunity to embarrass India by cancelling flights and closing border crossings, citing 'public health' concerns. Ironically, many of these same countries - the US, Saudi Arabia, and most - south-east Asian countries - are

themselves endemic areas for plague. While quarantining any geographic locality to contain the outbreak of a potentially deadly communicable disease is a sensible precaution, the same measures were not taken when plague originated in the US. Health inspections were not implemented for air or ground travellers leaving a plague affected country or state within the US. Other countries neither banned flights originating from the US nor imposed emergency health screening at ports of entry.

Despite a plague mortality rate consistently higher than India's in recent times (10 per cent in the US in 1992 and 1993 versus less than 1 per cent in India in 1994), the US Centres for Disease Control and Prevention in Atlanta, Georgia, offered to send four epidemiologists and technical experts to India during the panic in Surat. The government of India accepted critical laboratory supplies, but kindly declined the offer of expertise. The pattern was repeated in 1995 when CDC's Special Pathogens Branch spent \$ 1.8 million to help contain the epidemic of Ebola in Kikwit, Zaire. In spite of its efforts to control the spread of the hantavirus in Brazil and Argentina, the disease managed to reach US soil. The American offer of assistance was motivated not so much by charitable humanitarianism as out of a keen sense of national self-interest. Clarence J Peters, chief of the Special Pathogens Branch, acknowledged that his responsibility is to protect public health in the US. According to *Business Week*: "When he learns of an outbreak, he asks a series of questions: Is the problem here [in the US]? How easily can it get here? If it gets here, how easily can it spread?"[16].

Yet CDC, in analysing the public health potential of the Surat epidemic, itself admitted that "imported cases are expected to be rare"[17]. In fact, two weeks after the exodus from Surat, no imported plague cases had been detected in any other country. CDC further advised that "travellers to India and other plague-endemic countries are at low risk for infection with *Yersinia pestis*," but were nevertheless being provided with precautionary information[18].

Of all the occurrences of plague in the world in recent decades, only the outbreak in Surat elicited an international response which amounted to turning India into a quarantine nation for a number of weeks. In scale and mortality, it was certainly greater than the post-earthquake epidemic in Mamlia (Table 2), but this could not have been anticipated at the outset of the Surat epidemic, given the inadequate public health surveillance information available at the time. The only unique feature of the Surat epidemic was that it was accompanied by public panic and a frenzied mass exodus from the city, which risked a geographical spread of the disease. This was, no doubt, the trigger - or, at least, the excuse - that set off a

worldwide panic by national authorities and the international press.

The issue here is not that screening and quarantine measures should not be undertaken to contain the spread of a potentially fatal communicable disease. Rather the decision of when to apply these measures should be based on a scientific assessment of public health risks consistently weighed against the costs and public inconvenience of specific measures. Consider that if 10 or so confirmed cases originating in the US every year are no serious public health threat, why then should a potential case arriving from India be cause for overriding alarm? There remains the distinct possibility that certain national authorities and elements of the press, particularly those in the US, bear a 'holier than thou' attitude and sought to use the epidemic to embarrass India because of unrelated political differences.

PART OF A BROADER GEOPOLITICAL AGENDA

This non-reciprocal pattern is reminiscent of the US government's denial of visas to known HIV positive foreigners coming to attend an international AIDS conference when the US itself had the world's largest known HIV-infected population. This is consistent with the attempts to attribute the onerous origin of the AIDS virus first to Haiti and then to East Africa (still scientifically unproven) rather than to the US, thus

TABLE 1. FREQUENCY OF PLAGUE IN THE UNITED STATES

Decade	Number of States Reporting Plague	Confirmed Cases of Plague	Deaths due to Plague
1900-1903*	1	119	106
1904-1913	2	211	108
1914-1923	4	121	60
1924-1933	1	47	48
1934-1943	5	14	6
1944-1953	3	9	2
1954-1963	4	12	5
1964-1973	7	41	5
1974-1983	9	175	24
1984-1993	13	125	7

* Plague was first recognised in North America in 1900.

deflecting the associated notoriety from the US. Political, not public health, reasons were and still are evidently the driving force behind public health policy.

This is after all not the first time India has been embarrassed in a concerted action led by the US government, supported by a compliant press. In recent years, we may recall the intense diplomatic pressure of Russian president Boris Yeltsin to cancel the sale of dual-use cryogenic rocket engine technology to the Indian Space Research Organisation (ISRO) in 1993, the influence exerted on France to suspend the supply of fissionable reactor-grade uranium (U^{235}) to India's Tarapur reactor in 1993, applying 'Special 301' unilateral trade sanctions against India for failure to change its intellectual property laws to meet US demands in 1993, or the singling out of certain Indian fabrics for not meeting US flammability standards in 1994 when others were no better.

The purpose of these arguments is certainly not to deflect criticism from the Indian authorities' handling of the Surat epidemic. Had public health surveillance activities been sustained, the threat of a plague epidemic could have been foreseen before it happened. Once the first cases of plague had been announced, the authorities could well have calmed public fears by reassuring the population of available and precautionary measures. This could have averted panic and the mass exodus – and the pretext for adverse international reaction to embarrass India. The point is not that India should never be put on the spot, but rather that a nation with similar health problems of its own, such as the US, should not be allowed to manipulate non-political matters like public health for political ends – that is, to use distorted pretenses to boost its own standing in the world community at the expense of others.

Neither world public health nor international political standing are zero-sum games. Petty nationalisms vying for global political dominance serve no useful humanitarian end. There is ample room for all nations to correct their deficiencies, develop, and prosper on an even global playing field.

In a Debt Trap

Kripa Shankar

Failure to generate revenues and cut non-productive, especially administrative, expenditure has led UP into a debt trap.

UTTAR PRADESH is one of the poorest states but appears to be very reluctant to mobilise resources for faster development or to take measures to increase the efficiency of investments. Per capita tax revenue in the state is almost one-third of what it is in the richer states – even backward states like M P and Rajasthan have higher per capita tax revenue. A state like Kerala which does not have a much better per capita income has a tax incidence of Rs 570 as against Rs 249 in U P.

The share of the state's own tax revenue in the total revenue receipts is constantly declining, and currently it is only 35 per cent. The share of the state's non-tax revenue has also declined to 12 per cent. The rest comes by way of assistance from the central government and share in central taxes. But as for revenue expenditure the state appears to be unmindful of its rising non-developmental expenditure. In 1995-96 the total revenue receipts are slated to increase by Rs 1,541 crore over the previous year's revised estimates, but expenditure on administrative services alone is slated to rise by the same amount of Rs 1,541 crore. Thus rise in administrative services will eat away the entire increase in revenue receipts. Interest payment is to increase by Rs 621 crore, expenditure on organs of state by Rs 121 crore. All this will be met by borrowing and cutting down capital expenditure. The share of developmental expenditure in the total revenue expenditure has been steadily declining but it is for the first time in 1995-96 that its share will be lower than that of non-developmental expenditure. One of the reasons is the doubling of the expenditure on administrative services in a single year from Rs 1,443 crore in 1994-95 (R E) to Rs 2,984 crore in 1995-96 (B E) on account of larger D A payment to employees. Within the broad group of administrative services, expenditure on the legislature, cabinet, secretariat, general services and district administration is slated to rise by six times from Rs 274 crore to Rs 1,758 crore in 1995-96 (Aya-Vyay ki Rooprekha, 1995-96, p 16).

Non-developmental expenditure on revenue account increased by Rs 2,268 crore

in 1995-96 over the revised figures of the previous year but developmental expenditure increased by only Rs 340 crore. There was an actual decline in the expenditure on agriculture and allied activities, industry and minerals and transport. It may not be out of place to mention that expenditure on agriculture and allied activities (Rs 702 crore) accounts for only 3.9 per cent of the total revenue expenditure and if the capital expenditure of Rs 9 crore is added the same comes to just 3.1 per cent of the total expenditure both on revenue and capital account. Likewise the share of rural development is 5.6 per cent, that of irrigation and power is 6.4 per cent while industry, mining and transport account for another 2.9 per cent of the total expenditure both on revenue and capital account. Thus, economic services account for 18 per cent of the total expenditure in 1995-96 as against 20 per cent in the previous year. Social services like education, health and welfare of S C, S T and backward classes account for another 21 per cent of the total expenditure. Administrative services including pension also accounts for 21 per cent of the total expenditure. Interest payment and debt servicing account for 27.3 per cent of the expenditure. Over the years it is the share of the latter two that has been increasing and now accounts for nearly half of the total expenditure.

In 1995-96 borrowing of the state government is slated at Rs 5,767 crore while interest and debt repayment is put at Rs 6,264 crore. The latter forms 108 per cent of the former. The state has now entered a debt trap.

The revenue deficit is rising rapidly – increasing from Rs 725 crore in 1991-92 to Rs 3,125 crore in 1995-96 (B E). The overall deficit (revenue and capital account) has also increased from Rs 716 crore to Rs 1,998 crore during the same period. If the latter has increased at a slower pace it is because capital expenditure is being cut down. The same has declined from Rs 6,481 crore in 1991-92 to Rs 4,910 crore in 1995-96 (B E). Capital expenditure as a percentage of capital receipts has declined from 99.9 per cent to 81 per cent during the same period. It is a

disconcerting situation that despite absolute declines in capital expenditure to the extent of 24 per cent the overall deficit has increased by 179 per cent during this period. Revenue deficit is now 21 per cent of the revenue receipts and overall deficit is 9 per cent of overall receipts. In 1991-92 the respective percentages were 7 per cent and 4 per cent. The burgeoning deficit can be met either by more borrowing resulting in greater tightening of the debt trap or by cutting down on developmental heads as neither debt servicing nor administrative expenditure can be cut. This is reflected in the declining share of economic services which declined for 32 per cent of the total revenue expenditure in 1990-91 to 26 per cent in 1993-94 and further to 21 per cent in 1995-96. Though in nominal terms there is a modest increase in the expenditure, in real terms there is a significant decline. This increase is also due to the disproportionate increase in salary and establishment charges accompanied by declining efficiency. To illustrate, the expenditure, both revenue and capital, on crop husbandry declined from Rs 451 crore in 1994-95 to Rs 369 crore in 1995-96 (B E), but the D A to the staff increased from Rs 61 crore to Rs 65 crore (Budget Paper, khand-2, bhag-2, 1994-95 and 1995-96). The salary bill of the government is only slightly less than the total own tax revenue of the state. While the latter is slated to rise by Rs 400 crore in 1995-96 over the previous year's revised estimates, the former is slated to rise by more than Rs 500 crore. There are 9.8 lakh state employees out of which 66,056 are gazetted employees. They manage to corner a big chunk of the revenues.

The inability to generate more resources and cut non-productive expenditure and improve the efficiency of investment has resulted in declining capital formation through budgetary resources. The same has come down from Rs 4,041 crore in 1994-95 (R E) to Rs 3,597 crore in 1995-96 (B E). All this cannot but affect the future growth of the state

Biotechnology, New Global Money-Spinner

Suman Sahai

Biotechnology has come of age today and spells mega-bucks. The state of the art technology in the field is in developed countries which possess little or no germplasm. Developing countries, rich in genetic materials, have a poor technology base. Hence the attempt by developed countries to create instruments and institutions to control the genetic wealth of the world.

NOW that the subject of patents on seeds and other life forms has caught the public imagination, it is a good time to ask: Why has genetic material suddenly become enmeshed in trade discussions; why has biodiversity become the new focus of the environmental debate; why are new fora being created to bring to the global platform the question of access to the genetic resources of individual nations? Why have all these issues peaked now, in these last few years?

The reason why the spotlights are on genes and cells, the little understood stuff of science and research, is the emergence of biotechnology as a mature and so to say, ripened technology. Biotechnology which was till now confined to the laboratory has now begun to enter the market. Its handlers are not anymore just the universities and scientific institutions but increasingly the corporate sector. The raw materials of biotechnology are genes and cells and living organisms like bacteria, its tools are genetic engineering. That is the reason why genes and cells are now on the centre stage of international trade. In today's market language, biotechnology spells mega-bucks. According to the projections of several reputed institutions, biotechnology is slated to account for almost 60 to 70 per cent of the global economy for at least the next two to three decades. What is of special relevance is that biotechnology covers a span of economic sectors which is unprecedented. It will play a role in fields as diverse as mining, feedstock chemicals, energy, pharmaceuticals and of course, food. Disconcertingly, going by present trends, this biotechnology sector will be almost entirely in the hands of the 10 to 12 largest multinationals of the world.

Although biotechnology has been used by human civilisations since long in the production and preservation of foods like cheese and wine, its impact on the global economy is more recent. The effect of this new technology is perhaps most visible in the pharmaceutical industry where drug production has been revolutionised. With the advent of recombinant DNA technology

or what is popularly called genetic engineering, the last decade has seen a revolution in the methods of manufacture of those drugs that were originally obtained from animal and human tissues. Now, the genes that direct the synthesis of such compounds like insulin or clotting factor VIII have been identified and located. With the tools of genetic engineering it has become possible to cut out the gene for, let us say, insulin synthesis, normally found in the pancreas of animals, and transfer it into a strain of bacteria. Once planted inside the bacteria, the gene for insulin continues to do in the bacteria what it did in the pancreas of the pig, namely, produce insulin.

The advantages of this approach are many. Since bacteria grow very fast and quite easily in the laboratory, the quantities of insulin or any other drug they produce is several times that extracted from the pancreas, or other tissues of animals. And it works out much cheaper. This kind of genetic manipulation has become a routine method of production since 1982, when the first biotechnologically produced insulin was released on the market. The bacterial strain found most suited to act as a 'bio factory' for drug production is *Escherichia coli*, normally found in the intestines. What is being done with insulin is also being done with human growth hormone which is used to treat dwarfs, and interferon, which is a sort of wonder drug promising cures for conditions as diverse as cancer and viral inflammations. And this is only the beginning. Many more drugs are in the pipeline awaiting approval from drug regulating agencies that are rightly cautious about releasing genetically altered products.

If modern medicine has turned living organisms as a means for drug production, then super modern medicine, the medicine of tomorrow has underscored this trend in still more novel ways. The latest medical research reports that commercial production of human pharmaceutical, proteins may be feasible in the milk of dairy animals. The breakthrough that the mammary glands of cows, goats and sheep can be used as effective

bioreactors has created a sensation in the drug world. Here is a procedure that places human pharmaceuticals, so to speak, on tap. The method is basically the same as what was being done with bacteria: the genes for drugs like insulin and clotting factor can be transferred into the cow or goat like they were into the bacteria, and like bacteria, these transformed animals synthesise insulin or clotting factor or interferon. The novelty in this approach is that since the drugs are secreted in milk, drug extraction is cheap, convenient and continuous. The 'bioreactor' does not have to be sacrificed in order to extract the medicine, as is the case with bacteria and in any case, with the intact animals whose tissues yield insulin or clotting factors.

The latest in this area of biotechnology are, reportedly vaccines which can be produced in plants because it is possible to introduce antibody producing genes into potatoes and peaches. It seems entirely likely that soon it will be possible to harvest antibodies for vaccines from a field. The implications are enormous for lowering the price of vaccines and opening new vistas in medical care. The profits to be earned are mindboggling.

In the plant world, biotechnology has made it possible for genes conferring advantageous traits to be brought into food and cash crops from any source. In conventional plant breeding, genes (traits) could only be transferred within related species. It was not possible for example, to take the disease resistance gene from tomato and put it into wheat. With biotechnology this is possible, and is being done. This approach can be used with effect in crop breeding. An important beneficiary could be pulses where traditional breeding methods have failed to achieve major improvements.

The growing influence of biotechnology can be seen in almost all sectors that relied on chemical processes to produce products. Instead of a chemical reaction that brings molecules together from two sources to 'synthesise' a new product, in biotechnology, the gene synthesises the product directly. The result is there are no toxic chemical wastes and biodiversity is much kinder on the environment than the chemical industry.

In the field of mining, a strongly polluting industry creating acid lakes that are hard to clean up, new bacterial strains are being discovered for bio-mining. Bacterial strains are already being tried for gold, copper and iron, and they are being discovered for other metals. These bacteria break down the ore to release the metal by 'feeding' on the ore. In bio-mining large volumes of bacteria in a culture solution are simply poured over the ore. After some time, the released metal can be collected and the digested material washed away. With biotechnology it has become

possible to exploit low grade ores which was not economically feasible with existing methods. This is of special importance to mineral-rich developing countries like India. These countries do not have efficient state-of-the-art technologies to exploit low grade ores and are therefore unable to exploit them.

Unconventional applications in various economic sectors have made biotechnology a formidable money spinner. It is the control over this technology that is being sought by the corporate giants of the world. The issue of gene and seed patents has exploded on the scene simply because the battle for the political and economic control of the genetic resources of the world has begun. This battle cannot be fought in laboratories, between scientists. Therefore, it has been brought to the trade fora where corporate gladiators can set the rules. Where trade sanctions can be used to force nations to grant access. Where a country's exports can be blocked till it agrees to conditions demanded by western nations with respect to its biological wealth.

This battle has been joined between the developed and developing countries quite simply because the genetic wealth of the world is concentrated almost exclusively in the tropical countries, that is, in today's developing countries. The biodiversity of this planet is found in the tropical rain forests, in the thousands of crop varieties in the fields of farmers of all tropical countries and in regions as disparate as the Andean mountains of South America, the jungles of Borneo and Costa Rica and the fields and forests of India and Nepal.

The developed world has the technological tools needed to convert genes to products and then to money. It does not have the raw materials. Its forests are large monocultural tracts and the diversity in its fields and forests is limited. Its agriculture is based on the germplasm of the south. So conscious is the north of the limitations of its access to genetic resources, that it has been a subject of strategy planning for a long time. J P Kendrick of the University of California at Davis which is the Mecca of agricultural research in the US, has warned that "If we had only to rely on the genetic resources now available in the US for the genes and recombinants needed to minimise genetic vulnerability of all crops into the future, we would soon experience losses equal to or greater than those caused by the Southern Leaf Blight several years ago... at a rapidly accelerating rate across the entire crop spectrum."

In order to overcome its limitations of raw material and to emerge as leaders of the commercial exploitation of genetic material, the corporate interests of the north need guaranteed and continued access to the genetic wealth located in the countries of the south. In order to achieve this, the governments of the developed countries have

dreamed up stratagems like GATT/TRIPS and the Biodiversity Convention. Undoubtedly others are being thought up to coerce the countries of the south by using their economic vulnerability as a lever against them.

The position then is that on the one hand we have the developed countries which have the cutting edge technology in the field of genetics and genetic engineering but have little or no germplasm. On the other hand are the developing countries which are the repositories of the genetic wealth of this world. In addition to this they are also the repositories of indigenous knowledge about how to use this wealth. In almost all cases the technological strength of germplasm owning countries is weak but there are a few exceptions of which India is perhaps the most outstanding.

India is one of those germplasm owning countries that also has a good indigenous technology stand. This is because the enormous investments made in agricultural research specially during the days of the green revolution created a strong scientific cadre from scientist to technical assistant. The combination of technology with germplasm, both its own, puts India in a unique position to take advantage of the field of biotechnology and emerges as a global player in this field.

There are obvious reasons for this. India is a germplasm owning country and in

South-South collaborations with other germplasm owning countries, it has access to a large range of genetic resources. It has a high technology stand available within the country and most of all it has a large repertoire of skilled manpower which makes available comparative skills at half the cost. A technician in India getting Rs 4,000 per month is about 15 times cheaper than a technician in Germany who would get at DM 2,500 per month, the equivalent of Rs 62,500. The great thing about biotechnology from India's point of view is the cost of the technology itself. Biotechnology unlike every other major technology to have developed in recent times, is not capital but labour-intensive. This is a tailor-made situation for a country strapped for cash but rich in manpower.

This combination of fortuitous circumstances is the reason why groups like Gene Campaign fight for the protection of its genetic resources. The Campaign's sustained position continues to be against patents and privatisation in this field. This is one modern technology where we can be highly competitive and should not allow ourselves to be tied up by patent laws that are not of our own choosing. For the first time since independence, India is in a position to be not just the consumer of a new technology but one of its important producers.

CALL FOR PAPERS

Unpublished papers are invited for inclusion in the following series being published by SPELL BOUND PUBLICATIONS PVT LTD, ROHTAK.

1. Rural Development: Theory and Practice

Editor: Dr I. S. Hooda,
Head Deptt of Rural Development,
M.D. University, Rohtak - 124 001

2. Leading Issues in Gender Development: Socio-cultural, Political and Economic Dimensions.

Editors: Dr (Mrs) Suprabha Dahiya
Dr (Mrs) Sneh Kumar
Dr (Mrs) Shobha Chaudhary

Contact Address:

Dr (Mrs) Suprabha Dahiya
F-2, University Campus
Rohtak - 124 001 (India)

3. Employee Involvement: Perspectives and Practices

Editor: Dr Ajay K. Rajan
Institute of Management Studies and Research
M.D. University, Rohtak - 124 001 (India).

Authors are requested to submit their papers by 30th of November 1995 preferably on floppy disk[s]

Pakistan's Mini-Budget

Recipe for Disaster

S Akbar Zaidi

The devaluation of the rupee announced in October along with other measures not only shows that the central bank of the country has little influence on decisions which affect the economy, but will derail the measures introduced in the 1995-96 budget which promised higher economic growth.

IT is impossible to see any logic in the confusing and contradictory signals given in the measures taken by the government in its mini-budget at the end of October. The reasoning behind the measures is probably better understood by those who make the policies, but for the rest of us, trying to decipher the meaning of these steps, which are at cross-purposes with each other, is turning into an arduous exercise.

The government announced the following measures on October 28, 1995: (i) a devaluation of the Pakistani rupee by 7 per cent; (ii) a 10 per cent import duty on all dutiable items, except edible oil and pulses; (iii) a 5 per cent duty on imports of all non-dutiable items, with a few exceptions; and (iv) The *piece de resistance*, a 7 per cent rise in petroleum prices. Following these measures, the State Bank of Pakistan was forced to raise its lending rate by 1 per cent, to 16.5 per cent, and there was also a 1 per cent rise in the concessional lending rate for buying locally manufactured machinery which went up to 14 per cent. On their own, these measures may merit some consideration. However, collectively, they make no sense whatsoever.

Before we examine the impact of these measures, some interesting miscellaneous issues have also emerged. Over the last few weeks when rumours were rife about the imminent devaluation, the governor of the State Bank of Pakistan reiterated his claim that the rupee would not be devalued and that it would be allowed to depreciate only gradually. The conviction of the governor was so strong, that he publicly rebuked the commerce minister for suggesting that the rupee would be devalued, and asked him to stay out of the domain of the State Bank. With the devaluation decision, governor Yaqub has ended up with egg on his face.

The government's decision to devalue despite the proclamations of the governor of the State Bank, also shows that the central bank has little autonomy and authority over affairs which the State Bank ought to be accountable for. The exchange rate is announced by the State Bank each day and

this institution is actually responsible for managing the managed float. By being sidelined in one of the most important decisions which affect the country, the economy and the State Bank itself, the government has demonstrated its indifference towards the central bank of the country. So much for the effective independence of the State Bank. A third concern regarding the devaluation issue relates to the credibility of the government and its senior officials. How seriously can we take any of their claims now? By going out of their way by saying that they won't devalue, the government and its institutions were giving certain clear signals to investors and the public in general. By devaluing, all trust in such proclamations has evaporated. Hence, the post-devaluation statements saying that they won't devalue any further, have lost all credibility.

While the credibility and reputation of the State Bank, its governor and the government in Islamabad, is now suspect, the role the IMF has played in the devaluation and mini-budget decision seems somewhat at odds. Did the IMF have any role to play in the mini-budget at all? Were there any preconditions to the release of the remaining \$ 300 million which Pakistan was claiming as part of the (now abandoned) Extended Structural Adjustment Fund Facility 1993-96? If the IMF was involved, it becomes a little difficult to understand how they came up with such a contradictory package. If they weren't involved, things only get curiousest and curiousest!

The biggest single problem that the government faces today on the economic front, is inflation. The inflation rate in the last financial year 1994-95 which concluded in June, was officially 12.9 per cent, the highest since 1980. One would have thought that the government would have gone out of its way to curtail inflation in the current fiscal year. It did announce a target rate of 9.5 per cent for 1995-96, but most economists felt that the eventual rate would be slightly higher, around 12 per cent at the end of the year. As imports become substantially more expensive, both due to the 7 per cent

devaluation factor as well as due to the 10 per cent levy, the inflation rate will rise. Not only that, but the 7 per cent increase in petroleum prices will also add fuel to the fire of rising prices. With the inflation rate at present around 13 per cent, we can expect at rate of at least 16 or 17 per cent by the end of the current fiscal year. While the official inflation rate will probably be the highest since the days of Z A Bhutto, it would be fair to say that we will be seeing the real, 'unofficial' rate, at close to 25 per cent at the end of the current fiscal year. No attempt at fine-tuning or monetary and fiscal restraint will get the government out of this one.

One reason why inflation has been high, is because the growth rate of the economy has been low. A growth rate of 2.3 per cent in 1992-93, 3.8 per cent in 1993-94 and 4.7 per cent in the last fiscal year 1994-95 have all been substantially below the historic trend rates of 6.5 per cent in the 1980s. Again, one would have thought that the government would focus on higher growth this year by giving investor-friendly signals. The 1995-96 budget was well received because of its friendly tone, but immediately following the budget, the government raised petroleum and electricity prices. If that wasn't bad enough, the new signals given in the mini-budget are all growth-reducing. Let us see how.

Capital goods or raw material for capital goods make up 40 per cent of Pakistan's imports. Machinery on its own has a share of 20 per cent of all imports. These are positive signs which show that capital goods are being imported so as to increase production domestically. If the use of imports is for productive and investment purposes, the overall growth rate can rise despite a deterioration in our balance of trade. However, the steps which the government announced on October 28 will have serious negative effects on growth in Pakistan.

Machinery will be more expensive due to devaluation and the import surcharge, so importers and investors may not be willing to invest. The cost of production will go up due to these factors as well as due to the petroleum price increase. Furthermore, the rise in mark-up rates raising the cost of capital is yet another constraint to investment growth. Despite an expected bumper cotton crop, the measures taken by the government after the budget for this year, all suggest, very strongly, that the growth rate will be well below the 6.5 per cent target for the current year, and we may experience a fourth consecutive year of lower than trend rate.

Devaluation is a mechanism used to increase exports by making them relatively cheaper. On its own, the measure may do

just that, but with the mixed bag of policies announced recently, all advantages will be lost. A higher duty on imports means that raw material for our exports will be costlier increasing the price of exportable goods. The price rise in petroleum will result in an overall increase in prices affecting production costs, hence making our exports more costly. Thus, the price advantage which we may have gained due to the devaluation will quickly be dissipated by the subsequent substantial price rise in the economy. The net effect on the balance of trade may well be negative as exports fall and the price and value of imports rise.

The 1995-96 budget announced in June this year pleasantly surprised most people as it was investor-friendly, targeted inflation, and promised higher economic growth. Interventions by the government since July have nullified all positive expectations. The measures taken by the government will discourage investment due to the high cost of imported machinery and raw materials,

and due to the higher cost of capital. Inflation will rise to probably the highest level since the notorious early 1970s. And, the growth rate will fall well below the targeted 6.5 per cent for the year, despite a likely bumper cotton crop.

The incumbent government in Islamabad has survived many a crisis. It continues to ward off the fall-out from the increasingly brutal political and economic situation in Karachi. It has 'won' the Punjab politically. It has even dealt with IMF demands and kept it at bay. However, one wonders if the recent economic measures announced in October by the government may finally prove to be its own undoing. If that were to happen, one can be sure that there will be great joy across the land. People will be eager to see the fall of a government which will best be remembered for the largest number of foreign trips ever by a head of government, and for the highest inflation rates and lowest growth rates in two decades and, for little else

conservative elements in the contemporary political culture.

What is equally interesting is the way he extolled the organisation of the vast American army as a social institution similar to the family. In a recent interview, he said, "The Army became my other family. I liked being a soldier, and I liked the idea of being in a service. I believed and still believe there is something noble to it." This is not meant to be a criticism of Powell, but an illustration of the change in the political mood and rhetoric from the 1960s to the 1990s. The change in the views of the army and race relations which were dominant in the 1960s deserve attention as a context of Powell's statement.

The relationship between the blacks and the US army has been complex, like other institutions of the society. Blacks were recruited during the civil war by the Union Army and it is estimated that several thousands donned army uniforms, half of them saw action on the battlefield. But, they were segregated. The segregation in the US army continued until 1948, three years after the second world war by an order of president Truman. It was not effectively implemented until 1952, during the height of the Korean war.

Black recruits in the American defence forces today enjoy not only the relative lack of discrimination compared to other segments of the society, but they also benefit from a special form of social welfare benefits granted to soldiers, such as health coverage, pension, financial aid for education and possibility of economic mobility through defence-related establishments. Ordinary blacks joining what is described as 'free enterprise' sectors of society are unlikely to get similar benefits as easily as in the army. According to several studies, in proportion to the overall population size, the number of blacks employed by the defence forces is quite high. The reason, some scholars argue, is the opportunities for job available in the defence forces are higher than in other areas of life. With cuts in the defence personnel budget, this area of opportunity will shrink.

The decline in the rhetoric of radical politics of the 1960s must, also, be seen in two other perspectives. One is the increase in the number of the black middle class who face the dilemma of emulating the lifestyle of their class which consists mostly of the whites and distancing themselves from the lifestyle of those whose racial identity they share. While rejecting the white assumptions of racial superiority, many blacks in this group accept white middle class cultural standards and frequently form institutions parallel to the manners and mores of the dominant white majority. Advertisements and feature articles in some black-run

Black Politics in US Shift in Political Mood

Robi Chakravorti

The emergence of Colin Powell in US politics indicates decline of radical black politics and rise of middle class blacks in the country.

THE emergence of general Colin Powell, the first black chairman of the Joint Chiefs of Staff of the American military, in the political arena as a prospective presidential candidate can be seen as a crucial point in the shift in the political atmosphere since the turbulent 1960s. In the 1960s, terms like 'military-industrial complex', 'neo-colonialism' and 'racism' used to dominate the rhetoric of discussion; now, these terms have lost their punching power. Even if these terms are used, they are subordinated to the notions of the US as a Super Sam (to quote a phrase historian Toynbee once used), a relatively stable democratic cosmos in the midst of worldwide autocratic chaos.

General Powell's military role involved various acts of US intervention abroad, such as Vietnam, Panama and the Gulf war. President Reagan made him a national security adviser before he was named the chairman of the Joint Chiefs of Staff in 1989. With the decline of the radical political mood and rhetoric of the 1960s, it will be difficult to label Powell as a part of the

'military-industrial complex' today. Since his recent moves to enter the arena of presidential politics, he was described by some journalists as a potential 'Black Dwight Eisenhower'. The analogy is interesting. Eisenhower won fame by leading the war against Adolf Hitler. Powell can provide an image of fighting the little modern-day 'Hitlers' in Vietnam, Panama and west Asia. It is relevant to recall in this context that president Bush once described Saddam Hussain of Iraq as a Hitler. From this viewpoint, Powell can be presented as a longtime defender of 'national interest', a phrase frequently used in articles defending the American foreign policy of intervention.

Powell, in a recent interview, extolled his own family values relating his contact with extended family members. 'Family values' constitute an important part of contemporary political rhetoric of conservative forces. It is used often to criticise the blacks for lacking family values. Powell can be presented as an exception on this matter which will endear him to the

periodicals such as *Ebony* and *Jet* reflect straight imitations of the white middle class dominated consumer society. If the radical writer of the 1960s, Frantz Fanon were popular today, one could call this section of the black middle class as people of 'Black Skin, White Masks'. This was the title of his book published in English translation in the 1960s.

One American writer put the upwardly mobile black middle class dilemma as a conflict between 'the college boys and the corner boys', hinting at the street corner gangs in slum-areas which the middle class blacks were able to escape, but where the majority of the black population still live. This aspect of the middle class blacks' consciousness has been variously described in sociological terms as 'cultural schizophrenia' or 'structural pluralism'. In simple language, among the middle class blacks there is strong trend towards behavioural assimilation with the whites, but there is a lack of complete social integration with them. They are, at the same time, separated from the slum dwellers of their own race.

This aspect of the complex situation of the blacks can be seen in the context of a long-standing conflict between two outlooks or ideologies which had split up the black leadership and social movements in the past and is likely to be revived in contemporary times. One outlook can be called 'conservative-accommodationist', the other, 'radical-separatist'. The first type was represented by Booker T Washington, the other by WEB Du Bois. They were important figures at the turn of the century. Their different viewpoints, however, can see a reincarnation in the 1990s.

Booker T Washington, himself born a slave, saw the promise of the blacks in developing the puritan ethic of work and practicality. His model was of the 'responsible and reasonable' Blacks. He was unwilling to support agitational movements and to make direct attack on the whites for segregation. In a speech delivered in Atlanta he advocated a kind of live-and-let-live kind of pluralism, which historians describe as 'Atlanta Compromise'.

Washington's vocal critic was Du Bois, a Harvard graduate and professor at Atlanta university, who set up an all black organisation to oppose Washington's approach. Du Bois supporters' militant approach led to the foundation of the famous black organisation, the 'National Association for the Advancement of the Coloured People' (NAACP) in 1909 with the goal of fighting for the black people's "constitutional rights and the undeclared aim of curbing Booker T Washington's power". Du Bois shifted to the extreme left in the last part of his life, became a member of the

communist party in Ghana, Africa, where he went to live and died at the age of 93.

To understand the political posture of Colin Powell, one must place it in the context of the history of these two ideologies and the emergence of a sizeable black middle class which coexists with the increasing gap between the rich and the poor in the US and the worsening of the economic condition of the poor blacks.

The radical tradition among the blacks, however, is not dead. Jesse Jackson is still active; he recently organised a demonstration in Berkeley, California campus in support of Affirmative Action programmes. Black Nation of Islam leader, Louis Farrakhan, in a speech in the poorest black neighbourhood in the nation's capital, Washington, DC, proposed a 'million-man march' in the capital. The black community is ripe for a renewal, he said in his speech.

The liberal elements in the Democratic party, threatened by the electoral success of the Republican party tend to avoid the radical leaders of the black population. Farrakhan, in particular, is strongly disliked by the powerful Jewish lobby, and Democratic party politicians have to be careful about associating with him. President Clinton is seen rarely in company of Jesse Jackson. Some of the radicals of the 1960s have, also, changed their political colour. Film star Jane Fonda, who actively protested against the Vietnam war, is now wedded to a billionaire media czar and makes money selling a highly popular physical exercise manual.

The influence of the media is another factor that must be taken into account. As one watches the news about Africa and the third world, an average American's viewpoint is likely to be influenced by the fear and dislike of chaos and indiscriminate killings in various parts of the third world and a concomitant feeling of comparative advantage he enjoys. The rush of illegal immigrants from Mexico often appearing in media reports and political debates is prompted by the demand for cheap labour by American businessmen. But, instead of raising class consciousness, these reports may strengthen the feeling of comparative advantage which the majority groups will support in the name of strengthening the superiority of America's national image.

This factor is figuratively supported by Powell's statements narrating the history of his family's immigration from Jamaica and the success he achieved through hard work and opportunities of mobility which cannot be found in other countries. One can describe this approach as a new subtle theory of comparative advantage extolling a modern version of the Weberian concept of Protestant Ethic fostered under American socio-economic condition.

The dynamics of ideological conflict and changes that have affected black consciousness can be figuratively described by comparing Colin Powell with Marcus Garvey, the leader of the radical 'Black Zionist' movement in the first decade of the century. In the recent autobiography, entitled, *My American Journey*, Powell claims that his personal success story shows the US as a land of opportunity for people with spirit of enterprise.

Radical Marcus Garvey, also a Jamaican immigrant held a different view. He claimed that the advocates of racial integration were naive in their expectation of winning concessions from a fundamentally racist society. He advocated a separate development of the blacks and in time, a return to Africa, the 'Black Zion'. He was popular in early part of his career. He gave the blacks a banner of red, green and black, red representing the blood shed by blacks, green hope and black the skin colour. This banner was used by the black radicals in the 1960s. Garvey, however, lost his political clout and was deported in 1927 as an undesirable alien.

The radical legacy in the black movement since the 1930s took practical, goal-oriented grass roots forms of social movement culminating in the Southern Christian Leadership Conference led by Martin Luther King in 1956. The legacy of this tradition among the blacks is not dead as illustrated by instances of Jesse Jackson and Louis Farrakhan. But, their power is limited since they are deliberately neglected by the major political parties and powerful lobby groups. Moreover, the political atmosphere in the country does not seem to encourage the emergence of massive grass roots movements as in the 1960s.

Colin Powell as a black leader can win support of important sections of the two ruling parties, conservative 'America-first' nationalists because of his outstanding role in the army in defence of 'national interest', sections of the black middle class and new immigrants, and powerful lobby groups. The last is extremely important since expert media exposure is essential to promote popularity among the voting sections of the population. Powell has turned into a welcome lecturer in political gatherings of different groups, mostly corporate ones. He received six million dollars in advance for his autobiographical book. He goes around telling stories of his own life and his parents' struggle in his childhood days and how their lifestyle inspired his work ethic. Ironically, as one journalist pointed out in a recent article, he tells this "wonderfully American story for the equally wonderful American price of around \$ 60,000 a lecture".

From Victim to Agent

Memories of Emergency from a Resettlement Colony in Delhi

Emma Tarlo

Literature about the emergency tends to portray the intellectual as the emotional sufferer, the bureaucrat as the active participant and the poor as the passive victim. Such stereotypes are dangerous for they seem to mask the most frightening aspect of the emergency regime – its ability to draw all kinds of people, through fear, into participation. To ignore the active role of the thousands of men and women who competed for plots in the resettlement colonies of Delhi is tantamount to denying the generality and diffuseness of the power of the state as it seeped into the corners of everyday life, inviting strange and unnatural responses.

CRITICAL literature concerning the historical and political significance of the emergency (1975-77) in India has tended to focus on four main categories of participant: the leader, the bureaucrat, the resistor and the victim. While the first three types of participant are remembered in terms of the active role they played in the emergency, the victim, when not portrayed as resistor, is seen as the passive recipient of direct physical state abuse. Important though these categories are to our understanding of emergency, the aim here is to highlight the role of another category of actors found, in particular, in Delhi. Like all members of Delhi's urban poor these other actors were the main targets of the demolition and sterilisation drives that became such important features of emergency in the capital. They include 'rickshaw-walas', sweepers, peons, labourers, craftsmen, 'kabadiwalas', street vendors and poor housewives, all of whom can be considered the direct victims of emergency. But in calling them victims, it should be recognised that their participation was not, by any means passive. Unlike those who were forcibly sterilised, murdered or abducted, these were the people who actively contributed to government schemes; sometimes with reluctance, sometimes with indifference and sometimes with enthusiasm. In highlighting their particular predicament the aim is to analyse the process by which they were tempted to participate, and ultimately perpetuate, the state regime. The two main projects in which they were active were the Delhi Development Authority (DDA) housing policies and the family planning policies, both of which intruded deep into their domestic and personal lives. These two

policies, though conceived separately, at times functioned in unison, trapping their victims at the vulnerable point of intersection. For those caught in the middle, there was only one way of lessening the impact and that was by diverting the effects of one policy through participating in the other. This became a common survival strategy, but one which often involved the transfer of victimhood onto friends, neighbours and total strangers in the effort to save oneself. This set rolling a process of co-victimisation whereby the obvious targets of emergency also became active agents in the search for yet more victims. How this process came about, and how it related to market forces are the two main themes examined here.¹

Despite the passing of two decades it is not difficult to meet the people who were once the primary physical targets of emergency policies in Delhi. Many live in the various resettlement colonies that line the outer edges of the city. It was here that the interlocking of housing policies with family planning policies was at its most explicit. This was true both in the early resettlement colonies established in the 1960s and in the 27 new colonies established during emergency itself.² This study is based on the particular experiences of people living in East Delhi in a trans-Jamuna colony known as 'Welcome' (Seelumpur Phase III and IV).³ Like other resettlement colonies, Welcome houses people from all over Delhi and in this sense can be considered representative of a wide range of different Delhi experiences. Some inhabitants had been living and working as craftsmen, vendors, factory hands and rickshaw pullers in Old Delhi when their homes were demolished and they were

'resettled' during emergency; others had been working in building sites and commercial centres in New Delhi while yet others were already located in the colony and its environs when emergency was declared.⁴ Since the colony was initially established back in 1963, it provides interesting insight into the nature of the different problems faced by those already settled in the colony and those who joined it during the emergency years. But before examining their experiences, it is necessary first to outline the structure of the family planning policy, the housing policy, and the process by which the two became interlocked in Delhi.

The structure of the family planning scheme which, by February 1976, had become part of Sanjay Gandhi's four-point (and later five-point) programme⁵ is well known. In Delhi the force of the scheme lay in its centralised grip not only over government institutions: schools, colleges, hospitals, police stations, transport bodies and all offices of the Municipal Corporation of Delhi (MCD) and DDA, but also over private industries, civic bodies, traders, shopkeepers, cinema halls and, to some extent, even trade unions.⁶ By April 1976, it had become clear that the main thrust of the programme was not that people should plan their families but that they should cease to reproduce altogether once they already had two children. This was to be achieved through the quick and relatively easy operation of vasectomy and, to a lesser extent, tubectomy.⁷ What rapidly emerged was a pyramid of pressure for sterilisation, headed by Sanjay Gandhi flanked by members of the 'Family Planning Motivation Committee';⁸ with the heads of government offices, civic bodies and major industries a little below. Situated further down the pyramid were senior employees, followed by their juniors until, at the bottom was the low income workforce: peons, cleaners, coolies, gardeners, delivery men and transporters. The intention was to create a structure of motivation which was to function through an elaborate package of 'incentives' and 'disincentives'. Heads of institutions were provided targets for sterilisation and were instructed to recruit their victims from their staff. They were threatened with 'severe consequences' if they failed to meet these targets and promised substantial increments and rewards if their efforts proved successful. And it was through this same structure of threats and rewards that the pressure worked its way down the human chain to the bottom of the pyramid where unskilled workers who had more than two children found their

salaries withdrawn until they got themselves sterilised. While the pressure for sterilisation worked from the top downwards, the accumulation of cases worked from the bottom up. If a lower level official could boast that he had motivated 50 cases, then his superior would be able to accumulate around 300 cases, and the head of a large institution might be able to boast 1,000 cases. Rewards, in the form of cash, promotions and increments would then be duly distributed, providing people with a further incentive to motivate yet more cases in the hope of outdoing rival officers, institutions or companies, and reaping further benefits. These institutional pyramids, when slotted together contributed to the achievements of the union territory. Meanwhile individual states were left to raise their own targets and exceed them by almost whatever means they could, thereby creating an atmosphere of inter-state competition. Delhi, as the capital, was to set a spectacular example. In the year 1975-76 it more than doubled its target of 11,200 sterilisations, and in 1976-77 it more than quadrupled its target of 29,000,⁹ thereby achieving a record of 1,38,517 sterilisations (477 per cent of the target).¹⁰

There is no doubt that the pressure in government institutions, though intense throughout the system, accumulated most at the bottom of the hierarchy where those with no one beneath them could not gain merit by motivating inferiors but could merely save themselves from unemployment by submitting their own bodies to the operating table. Of the people interviewed in Welcome, all the men with more than two children who were working in the MCD — a mixture of sweepers, water supply men, demolition workers, construction workers, carpenters and gardeners — were sterilised (or occasionally had their wives sterilised) under the threat of losing their jobs. The same was true for all those employed by the DDA and Delhi Electricity Supply Undertaking (DESU).¹¹ But the fact that the pressure dug deepest into the bodies of the unskilled labour force, should not deceive one into thinking that its members did not actively participate in the very system of motivations and rewards that oppressed them. For, the pressure to motivate others for sterilisation extended into every domain both inside and outside the work place and at every level of the socio-economic strata. So too did the system of rewards and deprivations. And it was when these 'incentives' and 'disincentives' became framed in terms of land and property that the family planning programme and the DDA housing schemes joined hands.

Urban development policies in Delhi during emergency were built around the notion of clearing, beautifying and imposing

order on the city. These objectives were to be obtained by three major plans of action: demolition, resettlement and planting trees. Unauthorised property all over the city succumbed to DDA and MCD bulldozers leaving over 1,00,000¹² families displaced. The vast majority of these were either slumdwellers or long established residents of the congested Old city which was scheduled for massive clearance and redevelopment. These populations were shifted in trucks to resettlement colonies on the outskirts of the city where most were allocated small plots on which to build new homes. As vast sections of the urban poor found themselves relocated on the edges of the metropolis, their demolished territories were either levelled for new development or were converted into park land and planted with trees. Where there was insufficient space for such ecological imperatives, the remaining buildings were spruced up and the area declared beautified.

Whilst it is impossible to ignore the parallels between the sterilisation drive and the demolition drive both of which seemed to function to remove the urban poor, if not obliterate them from the city centre, it should also be recognised that the two policies initially functioned independently with the latter taking the lead. This meant that during the first 10 months of emergency all of the people whose homes were demolished had the right to a DDA plot without having to prove their participation in family planning. By the summer of 1976 the situation had changed. The DDA, having already accumulated sterilisation cases from amongst its staff, began to extend its family planning objectives into the public domain. This is done by making family planning, and in particular sterilisation, a criterion for the right to DDA housing. Flats, plots, tenements and loans became officially denied to those with more than two children who were not sterilised whilst those with less than two children had to sign a declaration promising to limit their offspring to two. To those already living in DDA property who had more than two children the DDA announced its plans for eviction, whilst to those who got themselves voluntarily sterilised the DDA offered priority allotments of new or existing housing facilities [Dayal and Bose, appendix pp 212-15]. An order issued by the Delhi Administration (M and PH Department) on May 15, 1976 clarifies the objectives. Under the heading 'Provisions for the General Public' it reads: "Allotment of houses, flats, tenements, shops and plots in all income groups... will be made only to 'eligible persons' or eligible couples... An ineligible person can become eligible on production of the sterilisation certificate in respect of him/her or his wife or her husband from

the previous authority' [Dayal and Bose p 223].

By incorporating the family planning policy into its housing policies the DDA had effectively trapped thousands of Delhi citizens into sterilisation. This trap was deepest for those citizens whose homes were being demolished on the outskirts of the city. As summer temperatures gave way to the hostile monsoon months,¹³ the need to have some form of shelter was an obvious imperative, but with demolition squads all over the city it was impossible to squat temporarily on unauthorised land. Some of the displaced citizens from inner city areas were still able to obtain plots purely on the basis of demolition slips, whilst others took shelter with relatives to tide them over for this harrowing period, but for 'jhuggi' dwellers living in and around resettlement colonies, the situation was more difficult. Their relatives were either in their villages of origin or, like them, displaced from demolished jhuggis. For them the only official way of remaining in Delhi was by getting sterilised through the rapidly emerging DDA family planning motivation camps. It was essentially a choice between sterilisation or homelessness. Through examining the reactions of those who obtained plots in Welcome it is possible to gain insight into how people coped, and to some extent, circumvented this choice.

WELCOME: A RESETTLEMENT COLONY

Although Welcome was to take its current shape during the 20 months of emergency, it is not a direct product of the emergency period. It was initially developed under the Jhuggi Jhompri Removal Scheme (JJRS)¹⁴ way back in the 1960s when slumdwellers were offered plots in exchange for their demolished jhuggis.¹⁵ To be entitled to a plot a person had to be in possession of a demolition slip and an allotment slip (sometimes combined) which acted as proof of their authenticity and entitlement. What they got in return was a temporary 25 sq yd¹⁶ 'camping plot' or 12 sq yd 'commercial plot' for which they were charged a nominal licence fee. Some wealthier residents soon transferred to built-up tenements on a rented basis, but the rest of the population either made do with simple plots or left the colony. By the mid 1970s there were 2,551 residential plots in Welcome of which approximately 75 per cent were in the hands of the original allottees with the remaining 25 per cent either abandoned, rented, squatted or purchased by new comers.

How did the DDA's emergency policies affect the development of the colony? The most obvious effect was that an additional 1,483 plots were provided for incoming

residents. These residents consisted of people whose homes had been destroyed in the new demolition drives throughout the city¹⁷ as well as tenants from nearby areas and people transferring from other resettlement colonies further afield. Those who were 'fortunate' enough to have their homes demolished in 1975 were allocated plots on the simple basis of demolition slips but for many of those entering the colony in 1976 as well as those already living in the colony without allotment slips, the situation was more complicated. They soon found themselves trapped in the new double bind initiated by the DDA's intensive participation in the family planning scheme. What this actually meant varied considerably according to a person's particular situation, but the main thrust was that without a sterilisation certificate a family risked losing its right to both property and space: those whose homes had been or were being demolished in and around Welcome were barred from getting new plots, whereas those who had purchased or rented accommodation in the colony were threatened with eviction. By contrast those who produced a sterilisation certificate could obtain plots, regularise unauthorised structures, transfer from other colonies, obtain loans, transform residential into commercial plots and do all manner of things which were usually unattainable. But the one problem was that in order to do these things a person had to get sterilised. Or so it at first appeared from the DDA statement that a person must produce a sterilisation certificate "in respect of him/her or his wife or her husband". But on further scrutiny there is an ambiguity in the wording of the document, an ambiguity which was to offer the seekers and savers of plots an alternative path. When the document states that the certificate should be 'in respect' of the husband or wife, what does this actually mean? Does it mean that it is the husband or wife who must get sterilised and produce their own certificates or does it mean that as long as either the husband or wife registers a sterilisation certificate then the transaction is valid? In theory it meant only the former in practice it very clearly meant both. This gave vulnerable people two alternatives to homelessness: either they could get sterilised submitting their own certificates, or else they could produce someone else's certificate which acted as proof that they had 'motivated' the latter. It was, of course, an extension of the system practised in government institutions in which it was the motivators rather than the motivated who reaped the choicest rewards. And it was this possibility of motivating the other that was to invite the process of co-victimisation as many chose to transfer the pressure for sterilisation onto those more vulnerable than themselves. As

one man in the colony recently put it, "it was like sacrificing others to get benefits for themselves".

Before turning to the personal experiences of people in the colony, it is helpful to get an idea of the number of people involved. Of the 3,459 personal files available¹⁸ concerning plots in Welcome, a total of 975 (28.1 per cent) of them contain a document called the "DDA Family Planning Centre Allotment Order". These orders bear witness to 1,098 operations of which 506 (46.1 per cent) were 'motivated', 486 (44.3 per cent) were 'self' and 106 (9.6 per cent) remain unspecified. The number of operations exceeds the number of allotment orders because in some cases the DDA extracted more than one case per plot out of the motivators. These figures do, of course, represent only property related cases. To obtain the total number of operations performed on the residents of Welcome one would have to double, if not triple these amounts.

The DDA Family Planning Centre Allotment Order is a small slip of paper containing a matter of fact list of required information: the applicant's name, father's name, age, number of children, address, 'date of voluntary sterilisation' and 'nature of assistance claimed'. Flicking through hundreds of such orders in file after dusty file in the offices of the Slum and JJ Department, one gets a picture not so much of violent abuse but of a frighteningly mechanical bureaucracy whose very efficiency seems to mask the fact that it is dealing not in lottery tickets but in human infertility. Under point 5, demanding the date of the 'voluntary sterilisation' the DDA official notes either 'self sterilisation' or 'motivated case'. In the former instance he fills in the applicant's name, sterilisation number and date of operation; in the latter case he includes the same details but this time concerning the motivated person or persons. This leads to point 6, 'nature of the assistance claimed', opposite which the DDA officer generally writes one of the following: 'allocation of residential plot', 'regularisation of residential plot', 'regularisation of commercial plot', 'transfer of plot in applicant's name' or 'transfer from... colony' and so forth. Occasionally one comes across an unusual case such as a Hindu woman regularising an unauthorised temple by getting sterilised, but even this is made to seem unremarkable through the starkness of the statement: 'regularisation of religious plot'. Finally the order is signed or thumb printed by the applicant concerned and handed over to the local DDA Executive Officer, then K K Nayar, who personally signed and dated every order. Once processed, the slips are slashed in blue biro

and a comment added to the effect that the incentive has now been used up. This was to prevent the same allotment order being used twice.

It is not difficult to draw a profile of the people who submitted their own bodies for self-sterilisation. They were, on the whole, the poorest of the colony who could not afford to motivate others but who wanted either to save their homes from confiscation or to obtain a plot. As one old man put it: "We would not have got sterilised ourselves if we had had the money to purchase cases". In spite of having listened to many of their accounts as to how they came to have the operation, my aim here is to focus, not on their experiences, but on the predicament of those who decided, for whatever reason, to motivate others. For it is they who, by transferring the burden of sterilisation onto friends, neighbours and total strangers, became co-victims of the emergency regime. Through their experiences we can trace the process by which the family planning programme developed into a warped but profitable trade which lured ordinary citizens into active participation. We can also get a clearer sense of the logic and reasoning that enabled these participants to perceive this blatantly abnormal trade as acceptable and even desirable at the time.

Let us begin by tracing how people in Welcome set about trying to motivate others. It certainly was not through convincing them of the benefits of family planning. Since both the motivators and the motivated were almost unanimously opposed to the operation,¹⁹ the terms of persuasion had to lie elsewhere. Some turned to their immediate families where loyalty and sacrifice were easiest to find. In Welcome there were a few cases of husbands motivating wives, wives motivating husbands, brothers motivating brothers, sons motivating mothers and fathers. It is likely that these were not monetary transactions but cases of family members pulling together to help each other either to increase or to save their collective property. The most common permutation is that of sons motivating their fathers. In this case a young recently married man living in a joint family could succeed in obtaining a separate plot for himself, his wife and child by persuading his father to get sterilised. Since it was the son who was the motivator, it was he who claimed the reward, whilst at the same time retaining his own fertility. Meanwhile his father, who was probably nearing the end of his child-producing years, did not lose too much by having the operation. Similarly in cases where a family had already spread its territory through purchasing a second plot this same technique could be used to save the purchasers from eviction. Since no one was entitled to have more than

one plot registered in their name, the system of motivations provided a useful means by which a family could expand and legitimise its right to more property. This could, of course, be considered a form of 'family planning' but one which had very little to do with birth control. It throws light on the fact that for those registering cases with the DDA, sterilisation generally had much more to do with property rights than with trying to limit the size of the family.

As long as motivators found their motivated from amongst their own families, then the system of motivations retained a personal element. But such cases were comparatively few. Of the motivated cases documented in the files in Welcome, only 11 record motivations within the nuclear family. Even bearing in mind the fact that when a man motivated his married sister, as I was told sometimes happened, it was not recorded as a family affair, we can still conclude that motivations within the immediate family were relatively rare. This meant that it was necessary to find one's victim amongst more distant friends and relatives, but since they too were probably in need of sterilisation certificates, they were not necessarily ready to comply. Furthermore there was something awkward about persuading one's own relatives to face the knife, particularly for Muslims most of whom considered sterilisation a grave sin.²⁰ It is quite possible that for some families, the motivation option provided a means of establishing or resolving longstanding family debts. But conversations with people in Welcome suggest that the vast majority preferred to find their victims elsewhere. Once the search began outside one's own friends and relatives, the choice of victims was greater but the motivational factor was no longer sympathy or emotional blackmail but cash.

The government was offering people tins of ghee, electric clocks and a cash incentive of between Rs 75 and 90 for having the operation. This meant that a potential motivator had to be prepared to offer considerably more. For private employers there was an easy way out: motivate your staff under threat of dismissal. But the majority of people in Welcome did not have any staff and had to find their victims amongst people as poor or poorer than themselves. A few such candidates could be found within the colony, living mostly in those 1960s blocks that were inhabited mainly by scheduled castes. Here it was possible to find people who were willing to undergo the operation in exchange for offers of cash. Being too poor to raise 'pakka' constructions on their existing plots, they were not interested in obtaining more land and were therefore more attracted by offers of money than plots. But such people were in a minority

and finding them directly was a difficult and awkward process involving much searching and bargaining. Furthermore it was a process which must have soured relationships within the colony as each scanned his neighbour's 'guli' in search of a potential victim. An ironing man who found that his authorised 1960s plot had been regularised in the name of a squatter who had taken it by force during his absence, told me of the many difficulties he had faced in trying to find someone to motivate. Having three small children and full financial responsibility for his family, he was frightened of getting sterilised himself lest he should be weakened by the operation. On the other hand he needed a plot to replace the one that had been seized from him by force. Scanning the colony, he was unable to find anyone willing to be motivated for less than one thousand rupees which was way beyond his meagre capacity (probably at least four times his monthly salary). In the end he had to abandon the search altogether and has been living on rent ever since whilst his original plot has remained in the hands of the impostor who got himself sterilised in order to transfer ownership rights to his own name.

But there was a simple way of avoiding the sordidity and embarrassment of having to find a person for sterilisation, and that was by obtaining the potential victim indirectly through a 'dalal'. Such dalals were easy to find since they hung around in droves outside the family planning camps, and sometimes even came door to door offering their services. They found their victims mainly outside the colony amongst pavement dwellers, beggars, labourers, rickshaw pullers and villagers. Once outside the vicinity they were in a good position to obtain cheap sterilisations and to sell them at competitive rates back in Welcome. For the motivators, not only were the cases they purchased through dalals as cheap if not cheaper than direct motivated cases, but they had the added advantage of reducing the human contact since all the arrangement and financial transactions were done by the dalal. The motivator would simply accompany the victim to the hospital in order to be sure that he did not escape or try to run off with the sterilisation certificate.

In order to comprehend the circumstances that led people to approach such dalals, let us examine the predicament of a kabadi wood merchant in the colony. He had been allocated a plot after the demolition of his jhuggi in Matka Pir (New Delhi) in 1972. He had since purchased a second plot in the colony and it is this plot that he stood to lose during emergency. Government officials accompanied by local goondas came to his door giving him an ultimatum: either he was to hand over the documents of purchase, or else he was to get sterilised or 'give a case'.

As a Muslim he considered sterilisation sin against god and was also convinced of its negative effects on the body. This left him with only two options: either he was to hand over his documents, thereby losing both the plot and the structure he had raised on it, or else he could pay a dalal the sum of around Rs 500 in order for the latter to purchase a case on his behalf. Had he himself been faced with the direct task of finding a person for sterilisation, the kabadi man may well have hesitated or even chosen to renounce his plot. But with a dalal to do all the intermediary work, the choice of action seemed obvious: of course it made sense to pay for a case and save his property. Like many other 'motivated' people, the kabadi man's victim was a villager who had fled to Delhi to escape sterilisation in his village. The kabadi man, speaking 20 years later, recalls: "The person who got sterilised for me had escaped from a village called Mehwa in UP. His buffaloes had been captured by the 'patwari' and 'amin' with the help of the local police, and he was threatened that, if he didn't get sterilised, his land and house would be confiscated too. So he ran away from his village and came to Delhi thinking that if he had to get sterilised then he would rather do it here where the doctors were better and where he could earn some money for having the operation." Asked about the victim's age and whether he had children the kabadi man answered: "He was a young man... I think he must have had children but I cannot say for sure." Then, with a ironic laugh, as if suddenly struck by the brutality of his own vagueness, he added "You only thought of yourself at that time!" The money he had paid went directly into the hands of the dalal, and the kabadi man never knew how much of it was seen by the person who got sterilised. Neither did he need to think too much about it. The victim had disappeared out of his life on the same day he had entered it, and the kabadi man need never see or hear of him again. There are many people in Welcome who, like the kabadi man, accepted the services of dalals either to save their purchased or rented plot or to obtain a plot to replace their demolished jhuggis.

The personal contact may have been reduced by dalals finding victims outside the colony and bringing them to purchasers inside the colony, but it was not altogether eliminated. There was still that awkward moment when the motivators had to meet their victims in person and accompany them to the hospital. The fact that two decades after the event, the kabadi man can still remember details of the villager he 'motivated' suggests that he had not been able to ignore the poor man's plight altogether. But the risk of rousing uncomfortable emotions in the minds of

motivators was soon to be minimised yet further by dalals offering sterilisation certificates directly for sale. Once a motivated person had been taken to the hospital by the dalal and made to renounce his certificate, there was no need for the motivator to suffer seeing him at all. So by eliminating awkward factors such as the age, identity and situation of the victim, the dalal was able to reduce the transaction to a purely monetary affair. The motivator need not worry whether his victim was unmarried or not; he was simply purchasing a piece of paper for which he would bargain as best he could. This left dalals free to obtain the valuable certificates by whatever means they could whether directly from victims or from other agents such as shopkeepers, other dalals and the local police. The elimination of the human element was therefore liberating both for the motivator and for the dalal, making the sterilisation certificate just one more commodity on the black market. And like all black market products, sterilisation certificates had histories which were best left buried as they passed from one person's hands to another.

To get an idea of the dubious means by which such certificates were sometimes obtained, I turn to the account of a factory worker who was living in Old Delhi until he got sterilised for a plot in Welcome. He gave a description of how shopkeepers in Old Delhi used to connive with members of the local police in order to extract cases in the area where he worked: "It happened like this; the shopkeepers would give information to the police concerning local labourers, telling them who were the ones who were homeless or slept outside in the streets since these were the easiest targets. The police would then arrest these people and keep them in the police station over night. The next day, the shopkeepers would go to the station and offer to bail the labourers out if they agreed to get sterilised. Once there, it was not difficult to make them get sterilised since they wanted to escape from the police and were frightened of going to jail... For every 40 cases bailed out by the shopkeepers, the police could keep 10 sterilisation slips for themselves." Obviously victims trapped in such tenacious sterilisation networks were not in a position to ask for money. Rather, they had to be grateful to the shopkeepers for bailing them out. Meanwhile their sterilisation certificates were siphoned off by both shopkeepers and police and entered local markets through dalals who sold them to individual clients. Divorced of the circumstances under which they were obtained, these certificates appeared to their purchasers, not as evidence of blackmail but as passports to security in the struggle over DDA plots. Concentrating more on their own plight than on that of the people they

'motivated', these purchasers were apt to believe the dalals when the latter told them the certificates had been obtained without any use of force.

Whilst it is easy to be critical of the position of the purchaser, it must also be recognised that such purchasers, trapped between family planning and DDA policies, were often in desperate positions themselves.²¹ Take for example the DESU worker who managed to escape sterilisation at work on the grounds that he had only one child, but who then found his jhuggi demolished only to learn that he could not get a new plot without producing sterilisation certificate.²² Technically a couple with only one child was 'eligible' for a DDA plot without a certificate, but since priority always went to people with certificates, those without (usually the childless, the widows, the aged, people with only one or two children) stood little chance. For this reason many of the people who produced 'motivated' cases rather than self-sterilisations in Welcome were those with less than three children. Feeling themselves unable to have the operation on the grounds that they wanted more children, they were more or less obliged to purchase cases. A notable example is that of young woman labourer who was working on a building site and living on rent in a jhuggi at the time of emergency. Despite being only 17 and having only one child, she had initially decided to get sterilised herself in a desperate attempt to save her family from the burden of paying rent. But her husband and mother had forbidden her to have the operation and even pulled her out of a government jeep that was heading for the hospital. Poor though they were, they decided that their only option if they wanted a plot was to motivate others. When they contacted a relevant official, they were told to produce five sterilisation certificates, a figure which was later reduced to three. In the desperation of the moment the couple's attention was focused more on how to raise the money than on whose certificates to purchase. Selling all her wedding jewellery the woman was able to raise enough to purchase three cases for a record low of Rs 150 each. After much difficulty, including sexual harassment from a dubious agent, she was able to register her cases and obtain a plot. Speaking nearly 20 years later, the couple are adamant that there was no force used in the family planning programme in Delhi (even though one of their own relatives had in fact died following the operation in U P). They claim that the people who got sterilised and sold their certificates to dalals did so because they wanted the monetary benefits. This is certainly true of some of the 'motivated', but in this particular instance the couple had paid only Rs 150 per case to the dalal. One wonders, then, what possible

benefits the victims could have enjoyed. Perhaps they got only the official Rs 75-90 or an electric clock or some ghee from the government. Or perhaps, like the labourers duped by the police and shopkeepers in Old Delhi, they did not receive even this. The point is that when people purchased sterilisation certificates in the open market, they did not know the history of the 'motivated' and it is no doubt this very ignorance that enabled them to ignore the more sordid aspects of the trade. For this reason there are some who look back on emergency as a positive time. The woman above even stated that she wished another such opportunity would arise so that other poor jhuggi dwellers and homeless people could obtain a plot, although she did qualify her statement by saying that the sterilisation should be voluntary.

MULTIPLICATION OF MOTIVATIONS

How was it that the cost of sterilisation certificates varied so dramatically with some, like the woman labourer, paying only Rs 150 per case whilst others paid anything up to Rs 1,200? These fluctuations seem to have occurred according to how difficult it was to persuade someone to get sterilised, how many cases were required per plot, how many plots were available from the DDA and whether the dalal's profit was made on the proportion of cases per plot turned over to the DDA or on the sale of a single case to a client. The price also depended upon the victim's willingness to sell and the purchaser's capacity to buy. Since some victims came more expensively than others, the dalals would, it seems, sell the expensive certificates to the wealthier purchasers whilst reserving the certificates they had obtained for nothing for their poorer clients.

Another factor that influenced the price of certificates was the decreasing availability of people to be sterilised. As one man put it: "As the time went on it became more and more difficult to find people who had not already been sterilised. So the rate increased and some people paid up to Rs 1,000-1,200 for a case. Before that the price had depended on how easily the people could be persuaded. Now it depended on how difficult it was to find someone still eligible for the operation." All of these factors help to explain why some residents in Welcome paid considerably less than others, but they do not explain why some residents gave two or three cases for a single plot whilst others gave only one. There are two possible reasons for this. One is that the DDA was running out of plots in the colony and was therefore raising the premium for the remaining plots.²³ But this does not explain why only certain types of people seem to have been told to produce more than one case per plot. Examining the

personal files in Welcome, it appears that most of the givers of two or three cases were either young couples with one, two or no children or else they were Muslims (occasionally they were both). What childless couples and Muslims shared in common was their violent opposition to self-sterilisation, the former on reproductive grounds and the latter on religious grounds. This raises the possibility that the DDA was deliberately exploiting their resistance to being sterilised by using them as agents to extract the maximum number of certificates from others. If such a hypothesis is true, it would certainly help to explain how in the wood market and the iron market, both of which are run by Muslims, the maximum proportion of cases per plot were accumulated. It would also help to explain how the woman labourer above, who had only one child, and her neighbour, who was childless at the time, were both expected to give three cases for their plots.

How the DDA officials justified their extraction of extra cases varied according to circumstances. In some instances they simply claimed that the cost of a plot was high from the start. The labourer and her neighbour had initially been told to produce five certificates until the number was later reduced to three. Since they were from outside the colony, they did not know that others had obtained plots with only one certificate. While the former had to sell her jewellery to raise the money, the latter, who had no jewellery, had to resort to selling every cooking vessel she possessed. Their accounts provide ample proof that a person's wealth was not the criterion for establishing the number of cases they had to give. In other instances the DDA officials would begin by demanding one case but later raise the demands to two or three by producing some convenient excuse. This was the technique employed in the wood market. In situations where a wood merchant produced a sterilisation certificate by motivating his craftsman he would be told by intermediaries that only sterilisations within the family could be accepted. But in situations where a family member did get sterilised, the merchant would be informed that his first certificate had been mislaid and he would have to produce another. How many of these extra certificates went into the pockets of dalals and how many were used for official purpose is not clear but at least nine files concerning plots in the wood market contain evidence of two motivated cases per plot.

The accumulation of cases through the scrap iron merchants was even more systematic and excessive. Unlike the wood merchants the scrap iron merchants were trying to enter the colony for the first time owing to the fact that their existing kabadi market in G T Road was due for demolition.

The fact that the existing market of 30 shops was authorised by the DDA, gave the merchants the bargaining power to negotiate for 50 sq yd plots in Welcome. Initially they were told that allotment slips would be issued at the time of demolition, but as time went on, the executive officer told them it was impossible to allocate the plots without their producing one sterilisation certificate per plot. This was agreed by the 'pradhan' (head) of the market association who decided to take personal responsibility for finding the cases. Acting as a dalal he, accompanied by some 'assistants', scanned streets and railway stations at night in search of possible candidates for sterilisation. When he found them, he brought them back to the traders, each of whom paid to have a case registered in his name. But by the time they had accompanied 30 men to the hospital for sterilisation, the DDA demand had increased. The pradhan recalls: "At first they demanded 30 cases. But then they kept on increasing the amount. When we gave 30 cases, they said: What is 30 cases? That's nothing! Give us 30 more! And when we gave them 60 cases, they said, we want another 30!... We paid around Rs 400 to 500 per case. The highest went up to Rs 700." The DDA executive officer justified these demands on the grounds that his superiors were trying to get the market moved to a less convenient location. Only by producing more certificates could the kabadi merchants be shifted to Welcome which was the colony they most favoured. Just what personal rewards the pradhan reaped from organising the 90 sterilisations is not clear but it is certain that he would have benefited for his labours.

By trying to extract the maximum density of cases out of Muslims, the government was, it seems, hoping to compensate for the general reluctance of Muslims to participate in the family planning scheme. The fact that the head imam of the Jama masjid had announced the denial of last rites to all Muslims who got sterilised had boosted the Islamic view that sterilisation was a sin against god. Trapped between threats from the government if they did not get sterilised and threats from their own religious leaders if they did, Muslims were presented with a particularly difficult dilemma. Giving a motivated case, though also considered a sin by some, was the only way of minimising potential losses on both sides. Where cases were found from outside the community then this at least saved Muslims from having to lead other Muslims down the path of sin. But at times the government did not even allow this option, specifying instead that only Muslim sterilisation certificates would be accepted from Muslim applicants. This had the effect of inviting people, not only to turn against their own religious doctrine, but also against their community in the

struggle for survival. A Muslim tool maker found himself faced with just such an invitation when the government demolished his shop near the Jama masjid and allocated him a commercial plot in Welcome. Since his home was still in Old Delhi and most other tool makers were obtaining plots in the newly-constructed Meena bazaar near the Jama masjid, this tool maker tried to get a transfer. But a senior government officer told him he could only transfer if he produced 10 cases and not just any old cases: "He told me: 'Give me Muslim cases! I don't want any purchased cases from you, I want only the cases of your own close relatives'. Unable to promise to betray his own relatives into committing the sin of sterilisation, and unwilling to get sterilised himself, the tool maker had to resign himself to remaining in Welcome. But there were some Muslims who were willing to impose the operation on other poorer members of their own community. The pradhan of the iron market, for example, had been ready to motivate 90 people, most of whom were, he claims, Muslim villagers who had fled to Delhi in fear of being forcibly sterilised at the hands of the local police. Meanwhile the pradhan retains the view that sterilisation is a sin against god and that he himself would never undergo the operation.

Most of the cases presented here have involved people who were trapped by government policies. They participated in the family planning scheme in order to lessen the crushing impact of the DDA scheme which threatened them either with eviction or homelessness. But there were others who took a more entrepreneurial approach. Instead of stopping short at using the family planning scheme to alleviate the effects of DDA policies, they went one step further and used the scheme as a convenient means of obtaining more and more plots. In the process they reversed their victimhood entirely and converted family planning objectives into an instrument with which to dupe the DDA. One such category of people were those jhuggi dwellers who, after obtaining plots through self-sterilisation, sold the plots and returned to settle in jhuggis, knowing that the DDA would demolish their jhuggies a second time, so enabling them to obtain another plot in a different colony. Having already got sterilised themselves they would take the opportunity of giving a motivated case second time round. This was not difficult since they had cash available from the sale of their original plots and were still able to retain some profit after purchasing a sterilisation certificate. The immense scale of DDA demolitions made it impossible for officials in different colonies to keep tabs on the thousands of names filling their files, so such cases generally went unnoticed. Although no one likes to openly confess to

having adopted this strategy, there are many in the colony who claim to have witnessed it first hand. The frequency with which such behaviour is described suggests that it was not uncommon. One man estimates that at least a quarter of the inhabitants of his particular block have sold their plots and settled in jhuggis, many during the time of emergency.

For wealthier members of the colony there was another strategy which proved even more lucrative. They would first obtain a plot either through self sterilisation or through giving a motivated case. As long as this plot remained registered in their name, it would be difficult for them to register a second plot in the same colony so they had to find an alternative solution. What they did was find an indirect method of motivating others, offering them Rs 50, not for the operation but for handing over their plots after the operation. The motivated man would register his case with the DDA as if it were self sterilisation. But once allocated a plot, he would be under obligation to sell it to his unofficial motivator with whom he had previously made a deal. Some of these unofficial motivators did this in order to obtain two adjacent plots, enabling them to have double the amount of space than their neighbours. But others made a veritable business out of it and would go on to sell the plots they accumulated, thereby entering the lucrative property market by using sterilisation certificates as a cheap means of obtaining plots. A survey conducted in 1989 bears witness to the fact that some plots were immediately sold after allocation. It is likely that these were the plots obtained by the unofficial motivators. Since Welcome was relatively well situated by comparison to many resettlement colonies, there was no shortage of buyers for plots accumulated in this way.

Most of those who entered the property market were relatively prosperous men who had enough capital and political weight to motivate more than one person for sterilisation. Since the majority of people in the colony had difficulty motivating even one person, there probably were not many who made a full scale business out of the trade in plots. Some poor women did, however, find an alternative means of entering the market. Their strategy was to obtain sterilisation certificates through sleeping with dalals. For them prostitution was a means of paying for the certificates which, for most people, cost more than their monthly salary. While some poor women seem to have slept with dalals out of sheer desperation, others apparently did so professionally in order to accumulate successive plots for sale. Such manipulations may not have been common, but they demonstrate the extent to which individuals

could subvert the system, turning apparently oppressive policies to their advantage.

In focusing on the active victims of emergency and on those who reverted their victim status by aggressively exploiting DDA policies, I have left many other stories untold. Little has been mentioned of those who were physically or emotionally forced into having the operation, nor of how people look back to the horrors and opportunities of those 'nasbandi days'. These are both topics I would like to discuss elsewhere, but my aim here has been, first and foremost, to point out the existence of co-victims at the bottom level of the socio-economic strata. This is not to deny their victimhood or underestimate their trials but rather to reverse the imbalances in the literature about emergency which tends to portray the intellectual as the emotional sufferer, the bureaucrat as the active participant and the poor as the passive victim. Such stereotypes are dangerous for they seem to mask the most frightening aspect of the emergency regime; that was its ability to draw all kinds of people, through fear, into participation. To ignore the active role of the thousands of men and women who competed for plots in the resettlement colonies of Delhi is tantamount to denying the generality and diffuseness of the power of the state as it seeped into the corners of everyday life, inviting strange and unnatural responses. Just as disturbing as the blatant force by which some victims were sterilised is the ease with which other victims imposed that burden on others. Many people in Welcome blame family planning abuses not on Indira Gandhi, not even on Sanjay, but on the petty bureaucrats and intermediaries with whom they had to deal. But there are a few alternative interpretations. Asked whose responsibility the family planning programme was, an ironing man replied disparagingly: "What responsibility? Everyone was responsible for this. You were responsible and I was responsible. The government started the programme but it depended on the person whether he accepted it or not."

Notes

- 1 The research on which this article is based was conducted from March to July 1995 as part of a collective project on Delhi organised by ORSTOM (Paris) and the CSDS (Delhi). It involved examination of local DDA and MCD records relating to a resettlement colony in Delhi, followed by in-depth open-ended interviews with residents in the colony. I am grateful to my research assistant, Rajender Singh Negi for his valuable contribution at every level, and to people of the colony for their willingness to talk openly and extensively. I am also grateful to the director of the Slum and JJ Department of the DDA and to the staff of the Slum and JJ Department, East Zone B for their kind co-operation.

- 2 There are currently 46 resettlement colonies in Delhi. The collective population of official residents is around 2.16 lakh households. The actual population is much higher owing to the development of jhuggi clusters within the colonies (cf Ali Sabir, 'Typology of Delhi Slums', working paper presented at the Delhi Seminar at the CSDS, Delhi, April 18, 1995).
- 3 Although officially known as Seelumpur phases III and IV, the colony is locally referred to as 'Welcome'. It is named after the old Welcome Hair Oil factory which used to be located there but has long since closed down. This distinguishes it from Seelumpur Phases I and II which are locally referred to as 'Seelumpur' or 'New Seelumpur'.
- 4 A state of emergency was declared on June 25, 1975 under article 352 of the Constitution on the basis that security was threatened by internal forces.
- 5 The Ministry of Health and Family Planning's attempt to get family planning added as the 21st point to Indira Gandhi's 20 point programme was rejected one month later on the grounds that such a measure was not necessary. This was presumably because Sanjay Gandhi's points were to be treated with equal validity as the official 20 points (cf *Shah Commission of Inquiry*, Third and Final report, August 6, 1978, pp 163-64).
- 6 For a good description, cf Dayal John and Bose Ajoy, 1977, *For Reasons of State: Delhi Under Emergency*, Delhi Ess Ess Publications, especially, pp 120-57.
- 7 A National Population Policy Statement issued by the government on April 16, 1976 clearly stated that sterilisation was to be the main plank of the programme, (cf Mehta Vinod, 1978, *The Sanjay Story*, Bombay Jaico Publishing House, p 118). That this was the case is evidenced by the fact that the achievement of national sterilisation targets reached 190 per cent in the year 1976-77 whilst achievement in regard to other forms of contraception fell far short of targets set for the same period (cf *Shah Commission of Inquiry*, Third and Final report, August 6, 1978, p 154).
- 8 The committee was set up by the Lt Governor of Delhi, Kishan Chand in late December 1975 with Vidya Ben Shah taking the role of chairperson (Mehta op cit 116). Its primary function was to motivate the top bosses of Delhi's civic organisations to take active responsibility in the vigorous new wave of family planning. Its most infamous non-official member was Ruksana Singh (otherwise known as Ruksana Sultana) who took charge of the controversial family planning camp at Dujana House in Old Delhi.
- 9 This target was in fact raised to one lakh by the Lt Governor of Delhi in April 1976. The indiscriminate raising of targets by different state governments is considered one of the major causes of the family planning excesses which followed. In his statement before the Shah Commission in 1978, the ex-union minister of health and family planning, Karan Singh, attributed this target-raising to the fact that chief ministers were anxious to win favour with Sanjay Gandhi, referred to indirectly as "an extra-constitutional centre of power." (cf *Shah Commission of Inquiry*, op cit, p 199, p 206).

- 10 cf *Annual Report of Ministry of Health and Family Planning*, 1975-76, 1976-77.
- 11 Out of those I interviewed, the only people with more than two children who managed to retain their government jobs during emergency without being sterilised were working for the railway authorities. One worked as a coolie and the other two worked in the parcel department at Old Delhi Railway station where their superintendent was apparently anti-sterilisation on the grounds that it would incapacitate his workforce. This superintendent was later 'transferred' and replaced by a stricter man who managed to motivate a number of sterilisations, but it still seems to have been possible to avoid the operation. Of the three railway employees I interviewed, one avoided sterilisation altogether, one motivated a case of sterilisation, and the other's wife got sterilised. These sterilisations were undergone not in order to save jobs but in order to obtain plots.
- 12 It is difficult to know the precise number of people resettled during the emergency. Jagmohan, then vice-chairman of the DDA states that 1,45,000 residential plots and 10,000 commercial plots were developed at the time. He talks in terms of the resettlement of 1,20,000 families involving a population of around 7,00,000 (cf Jagmohan, 1978, *Island of Truth*, Vikas, Delhi). That demolitions and tree plantations were directly proportional is suggested by a DDA publication during emergency which apparently boasted the resettling of half a million people and the planting of half a million trees [Dayal and Bose, 1977:109].
- 13 The monsoon of 1976 was particularly heavy with floods and cyclones in 10 states. In Delhi the Jamuna was reported to have risen 90 cm above the danger mark leading to the evacuation of some areas (cf *India Today*, September 1-15, 1976, p 11). The resettlement colonies in the trans-Jamuna were particularly badly affected owing to their location on low-lying territory, originally designated as 'green land' in the Master Plan.
- 14 The JJRS was initiated in 1958 on the recommendation of the Advisory Committee set up by the ministry of home affairs, government of India. It was approved in 1960, and its implementation was entrusted to the municipal corporation of Delhi (MCD). Over the years it has undergone frequent changes and modifications, with responsibility for its implementation being passed back and forth between the MCD and the DDA (cf Ali Sabir, *Slums Within Slums: A Study of Resettlement Colonies in Delhi*, Vikas, Delhi, 1990, pp 76-82).
- 15 The majority of these early settlers were removed from slums in B N Nagri (1963), Delhi Gate (1963, 1964 and 1965), Rajghat (1964), Central Power House (1964), behind the Red Fort (1964), Sher Shah Road (1965), Jhandewalan (1964), Dairy Kisan Chand (1965), Jamuna Bazar (1965, 1967, 1968, 1969).
- 16 The official 25 sq yd plot includes space for the front gutter. The actual space available for building a house is therefore 22.5 sq yd. In the earliest resettlement colonies of Delhi the government had begun by issuing plots of 80 sq yd. The size was later reduced to 50 sq yd and then 25 sq yd. The usual

explanation given for this reduction is that large numbers of resettled people were selling their substantial plots and returning to jhuggis whilst others found themselves unable to pay the necessary monthly instalments (cf Ali Sabir, op cit, 1990, chapter 5). By 1963, when Welcome was established, the size had already been reduced to 25 sq yd.

- 17 They were mainly from Bapu Dham (1975), Laxmi Nagar (1975), British School (1975), Jantar Mantar Road (1975), Jamuna Bazar (1975), Defence Colony (1975), Khyala (1975), INA (1976), R K Puram (1976), and areas around the Jama Masjid including Dujana House (1975), Kalan Mahal (1975) and Urdu Park (1976). Others were from demolished jhuggis in Welcome (1976) and nearby resettlement colonies (1976).
- 18 Welcome contains 4,034 residential plots and 198 commercial plots, making a total of 4,232 plots. The above statistic are based on an analysis of the contents of 3,459 files. The remaining 773 files were reported missing.
- 19 Both men and women tended to link vasectomy to the notion of impotence, and at times, castration. Of the 30 men interviewed who underwent the operation during emergency, not one of them claims to have wanted it. The same is true of the women who underwent tubectomy. All felt pressurised by forces which had nothing to do with family planning: saving jobs, getting children admitted in school, preventing evictions, obtaining plots and so forth. Two decades later some are strongly in favour of family planning but they resent the way it was forced on them at the time.
- 20 Most Muslims interviewed in Welcome were opposed to sterilisation, considering it an unnatural interference with Allah's will. Although a few prominent Muslims did take

an active role in promoting family planning during emergency, they tend to be remembered more as traitors to the community than as leaders worthy of respect.

- 21 By focusing on the dilemmas of the urban poor I do not wish to imply the process of co-victimisation was specific to them. Rather, I would argue that it characterised the structure of the family planning policy in general. Teachers, for example, were told to produce five sterilisation certificates and threatened with the withdrawal of their salaries if they failed to comply. Many motivated their pupils' parents with reluctance, whilst others purchased certificates from dalals. They too were co-victims of the system, but for those with neither power, education, money or influence, the situation was even harsher.
- 22 This unfortunate man ended up losing out on all fronts since, by the time he had got sterilised, the DDA claimed to have run out of space for new plots. His pragmatic solution has been to build himself an unauthorised structure in Welcome in the hope that one day the government will demolish it and offer him an official plot. For this, he is still waiting 19 years later.
- 23 There certainly were more people submitting sterilisation slips in Welcome than plots available. Near one block there are six unauthorised houses belonging to people who were unable to obtain official plots despite having valid certificates. In another block we came across two other families in the same situation. They had been told that the DDA had run out of space for further plots and that they would have to try for admission in a different colony. Having got sterilised through the motivational camp in Welcome, they refuse to leave the vicinity.

BEHAVIOURAL SCIENCE CENTRE

Behavioural Science Centre, a Non-Governmental Organization working in the field of Rural Development and Training for over 20 years, requires a **RESEARCH ASSOCIATE** to study selected NGOs in Gujarat and other states.

The Research Associate should be a Post-Graduate with second class, with an extensive experience of NGOs, proficient in English and Gujarati and willing to travel in Gujarat and outside. He/She will be expected to work full time from 1st January to 30th April 1996. Minimum remuneration will be Rs. 9000/- per month, negotiable on the basis of competence. Travel expenses will be taken care of. Modest accommodation facility may be provided if required.

Apply within 10 days with Bio-data, and a summary of experience with NGOs, to reach:

Making 'Poverty Research' More Relevant to the Poor

A Vaidyanathan

Including the Poor: Proceedings of a Symposium Organised by the World Bank and the International Food Policy Research Institute edited by Michael Lipton and Jacque Van Derkaag; the World Bank, Washington, DC, 1993; pp 579 plus Bibliography and Index.

THIS volume of collected papers emerged out of a series of workshops held during 1989 under the joint auspices of the World Bank and the IFPRI to review poverty research. They seem to have been part of the preparatory work of the *World Development Report 1990*, which was devoted to poverty alleviation. The papers are presented as a survey of the relevance of recent poverty research to the twin track strategy – "much of it undertaken under the aegis of the World Bank and the IFPRI" – for poverty alleviation recommended by the *WDR*. (One hopes that the editors do not mean to suggest that much of the recent poverty research has been undertaken only or mainly under the auspices of these institutions.)

The collection merits attention because of its wide scope, the relevance of the themes discussed, and the stature of several of the contributors as scholars on poverty-related issues. The papers are grouped into four parts. Part I deals with some important issues concerning concepts and measurement of poverty. Part II focuses on the effects of major events and policies form the subject of the Part III. Part IV consists of reviews of the trends in poverty and poverty alleviation programmes in three big developing countries.

CONCEPTS AND MEASUREMENT

Of the four papers in this section, one deals with the problem of measuring poverty variations from sample surveys; two are concerned with targeting; and the fourth with the relation between poverty and malnutrition. In addition Part IV has two long papers (Kakwani and Subba Rao and Malik) reviewing trends in poverty incidence in India and Pakistan, and their poverty alleviation programmes.

Kakwani rightly points out that poverty measures estimated from sample survey data cannot be used to infer differences/variations in poverty incidence without doing tests of statistical significance. Also valid is his point

that the validity of such tests depends crucially on the assumption that "samples used are representative of the population they are drawn from". He says that such an assumption may not be valid because of non-response errors or systematic non-sampling errors. But there is no discussion about how serious these errors are, how to assess them and how they affect the inferences. The paper would have been enriched if these aspects had been considered in the context of the Ivory Coast survey which forms the basis of the paper.

By far the most important contributions in this section are the papers related to targeting. Besley and Kanbur, reviewing the problem from a theoretical angle, explicate the main difficulties of ensuring that the poor and only the poor benefit from PA programmes: (1) the identification of beneficiaries and the administration of programmes involves costs; (2) beneficiaries have to incur a variety of costs to secure benefits; (3) PA programmes affect incentives to work and create incentives for understating income; and (4) it may be difficult to secure wide enough political support to strictly targeted programmes. Hence the appeal of mechanisms which encourage self-targeting and of targeting by indicators. The latter requires less information, is easier to verify and involves less costs. Country specific research taking these considerations into account and using micro level data is needed to devise targeting strategies appropriate to each situation. These strategies should however also comprehend the design of institutions (decentralisation, democratic local governments, minimising the agency problem) and programmes (minimising target groups and multiplicity of overlapping PA programmes). These aspects, which have a crucial bearing on efficacy of targeting, costs of monitoring and the incidence of leakages, do not figure in the discussion.

Datt and Ravillion argue that strategies focusing on elimination of inter-regional disparities in per capita income will make but a marginal difference to poverty

incidence. Much the more important problem, according to them, is to reduce intra-regional, (i.e. inter-class/individual) inequalities. This is not particularly surprising. But nor is it a meaningful way of posing the targeting problem in the context of PA programmes: Here the task is to maximise the impact of a given PA budget in terms of reduction in poverty incidence. Since the poor are very unevenly distributed across space, the regional allocation of PA budget is important. Linking these allocations to the number of poor and/or extent of poverty in different regions would substantially improve the efficacy of PA programmes compared to the situation in which targeting is done mostly by class or individuals.

Alderman discusses the reasons for, and implications of, recent findings that income elasticity of demand for food is much lower than earlier assessments. Some of the reasons for the sharp differences between nutrition surveys and consumer surveys (in terms of levels of intake and their relation to income) are cited in the paper, but not all. Nutrition surveys typically measure actual intakes (usually for a single day) while consumer surveys report gross food consumption (usually for longer periods). Apart from differences in the reference period, one has to allow for the fact that actual intake is likely to be less than reported gross consumption on account of losses and waste in the process of cooking and because part of the cooked food gets discarded into the garbage bin. The incidence of these factors could vary systematically across income groups. Casual empiricism would suggest that the rich tend to waste more than the poor which implies that elasticities of gross consumption would be higher than that of actual intake.

The evidence from sample surveys at different points of time also need to be interpreted with caution: The design and the manner in which information is elicited change over time. More importantly the level and patterns of reported food consumption are affected by several factors other than income, such as the monetisation of the rural economy, changes in the proportion of perquisites given in kind and changes in the extent of purchased meals/snacks and beverages taken outside the home. It needs to be demonstrated that, *after allowing for these other factors*, there is a marked reduction in elasticity of calorie intake and foodgrain consumption. If this is indeed true, it follows that ensuring that the income needed to afford the nutritionally

satisfactory diet will not by itself ensure that nutritional standards are met. This raises serious questions about the interpretation of poverty trends relative to nutrition-based poverty lines.

Alderman's other major point relates to the use of food intake or even physical stature and growth as indicators of nutritional status. The discussion draws attention to several important but neglected points. Physical stature *per se* is not an indication of nutritional status; growth faltering (and, one may add, changes in weight for height) are more relevant. Nutrition is but one of the inputs determining the health and well being of people; and the effects of food and other inputs are interrelated. Research on these aspects reviewed in the paper however is largely based on models of household behaviour focusing on the determinants of particular health producing inputs. Pinstrip Anderson's review of nutrition interventions (included in Part III) brings out the paucity of systematic empirical studies on their impact. Integrated programmes covering nutrition, health and education are more appealing in concept but there seems to be hardly any scientific evaluation of the impact of such programmes.

EVENTS AFFECTING THE POOR

According to Kakwani et al, judging by the behaviour of such overall indicators as per capita real income/consumption, government expenditure on education and health, life expectancy, food intake and school enrolment, economic problems and adjustment programmes of the 1980s did not on the whole cause any irreparable damage to living conditions. Their inference would have been more convincing if it had also given data on trend in poverty incidence and compared the experience of countries which went through SAP in the 1980s and those which did not. The data presented in the paper and also in the paper by deJanvry and Sadoulet (in Part IV) happen to show that between 1980 and 1986 most Latin American countries – where strong SAPs were taken up widely in the 1980s – recorded a significant decline in government expenditures on education, health and welfare, while others did not!

Based on a combination of illustrative examples from experience of particular country/regions and more formal and rigorous models in a few cases, Binswanger and Van Braum conclude that commercialisation and technological change in agriculture normally help poverty alleviation by inducing faster growth of agricultural

output and employment and increasing food supply. However, there are circumstances (usually associated with inelastic demand for agricultural produce or unfavourable institutional features and policies) which could impede the ability of the poor to take advantage of opportunities provided by growth. They are of the view that such adverse consequences can be avoided or mitigated by appropriate policies. Examples of the nature of such policies are also given.

The impact of agricultural growth on poverty alleviation via increases in non-farm employment is the subject of Hazell and Haggblade's paper. The econometric estimation of direct and indirect income and employment multipliers both overall and for different fractiles is impressively heroic. But it is apt to leave any reader aware of the limitations of the basic data rather sceptical about the inferences. The more so because non-farm employment is viewed exclusively as a function of agricultural prosperity and proximity/ease of access to towns. The role of public expenditure, the degree of commercialisation of agriculture, the characteristics of the rural labour force, of public policy in changing the relative attractions of rural vs urban locations for industry are neither discussed nor estimated.

Given that the negative externalities of rapid population growth (via degradation of resources) affects the rich as well as the poor, Birdsall and Griffin argue, it is sensible for

the rich in the poor countries and people of rich countries to devote a part of their resources for programmes (such as education, public health, old age security, poverty alleviation programmes) which reduces the 'demand' for children among the poor. But they are also concerned that the choice of methods to reduce fertility should avoid sterilisation and other ethically unacceptable means.

Polak and Williamson's review of Britain's experience in the early phase of industrialisation has some relevance to contemporary debates on poverty. Of particular interest is their finding that while poverty incidence did decline, especially in the mid-19th century, there was a relocation of the poor to the towns. The poor in towns were worse off. Also poverty became more dependent on market forces and was associated with low wages or large families, rather than widows, aged and the infirm. Anti-agriculture policies (which shift TOT against agriculture), regressive fiscal policy and marked income inequality went hand in hand during early industrialisation. The removal of traditional pre-industrial safety nets by *laissez-faire* policies of the industrial revolution, and government's failure to invest in urban social infrastructure despite their demonstrably high social returns meant that the poor were big losers. Protection against poverty/destitution had to be provided largely by the state and public institutions.

Nizamiah Observatory Campus, Begumpet,
HYDERABAD – 500 016

01. Applications are invited for positions in the Research Staff of the Centre to work on studies in the broad area of Health Economics.

Candidates must have a good masters degree in social science or other disciplines related to health, and in addition an ability to carry out independent research demonstrated by publications or by a Ph.D Degree.

The appointments will be made initially for a period of two years in the UGC Scales of Pay of Lecturers/Readers/Professors or on a consolidated salary depending on the qualifications.

02. Applications are also invited for M.Phil and Doctoral Fellowships in Health Studies at CESS.
03. Interested candidates may apply within two weeks of the appearance of this advertisement indicating the salary and the position expected.

DIRECTOR

The papers in this section deal with the role of specific interventions by way of land reform, rural development, nutrition programmes and social security in a few selected countries. The reasons for relatively limited achievement of state mandated reform programmes in Latin America and the prospects for achieving the goals through market mediated means are discussed by Carter and Meshah. Redistribution of land to small peasants would promote both efficiency and equity. But small farms find it difficult to compete with large holdings because of inherent imperfections in the functioning of labour and credit markets. These imperfections, they argue, affect the prospect of market-mediated reform as much as reforms under governmental auspices. Land tenure policies in Malawi (the subject of the paper by Sabhu and Arulpragasam) which deliberately favoured large estates against small holders, failed to stimulate productivity growth even as they aggravated the plight of small holders.

Birdsall and James argue against viewing privatisation and user charges for public services in terms of efficiency-equity trade off. Concentration of social spending on public goods (like preventive health programmes, primary health care and elementary education) and withdrawing from areas (like high cost curative services and higher education) would enhance both efficacy and equity. Distortions in public spending on social services, reflecting as they do the prevailing distribution of political and economic power, are difficult to correct. A practical strategy, according to the authors, would be to disseminate more information in the public domain on the nature and consequences of the distortions in order to generate the necessary political pressure and concentrate reforms on new rather than past investments so that the chances of their acceptance are improved.

The growing interest of the Bank and other aid agencies in social safety nets is reflected in the inclusion of a separate paper on Social Security and Public Policy. The paper, authored by Ahmed, provides an overview of social security programmes in developed countries, the prevailing formal and informal arrangements (including commodity transfers, subsidies, and public works and other protective and compensatory measures) to protect segments of population vulnerable to risks of income loss due to old age, bereavement and other life cycle contingencies, and to factors like unemployment and large shift in relative

prices. Useful as it is, the subject clearly deserves much more thorough treatment than accorded in this volume.

These papers are either too country specific or too general to advance the debate on remedies. Of greater interest are the papers which attempt to assess, in a general equilibrium framework, the relative merits of different policies for poverty alleviation. The paper on Brazil (Fox and Morely) looks primarily at macro-economic policies, while the Indian paper (Parikh and Srinivasan) assesses the impact of three different packages, namely, general good subsidies, targeted public works and reducing subsidies and using proceeds to invest in agricultural infrastructure. The Brazilian study concludes that macro policies (especially on wages) during the structural adjustment period were not conducive to poverty alleviation. The India study finds that a targeted works programme will achieve a much bigger reduction in poverty than generalised food subsidy programmes or using the resources to stimulate agricultural production. Given the limitations of basic data, the gaps in our understanding of the underlying interactions between various facets of the economy and the limited range of alternatives considered, scepticism about the robustness of the inferences from these model is inevitable. But this does not mean that the efforts are worthless. Rather it is an argument for investing more in efforts to deepen our understanding of the direct and indirect ramifications of particular interventions and in generating better data and refining modelling techniques.

CONCLUSION

Where does all this leave us in terms of understanding poverty and better ways of tackling it? The editors suggest that the contributions generally support the strategy — credited to the *WDR* — which combines policies to promote rapid growth with social policies to increase employment for the poor and to provide them basic social services as well as safety nets. There is nothing new in this so called 'twin track' strategy: countries like India have been committed to it for nearly three decades. What is new is the debate on the kind of policy reforms required to quicken the pace of growth and promote more efficient use of resources and on ways in which poverty alleviation programmes can be made more effective. Contributions of this volume deal with the latter issue.

The argument that structural adjustment does not adversely affect the poor or

expenditures on social programmes meant to benefit them is belied by the facts of the Latin American experience in the early 1980s. On the other hand, the volume reflects the by-now widespread consensus that even if growth is fast and benefits trickle down, state intervention is essential to alleviate the condition of groups and regions who do not or cannot avail of opportunities afforded by growth sufficiently to lift them out of poverty.

The discussion of specific PA measures in the volume is of rather limited value partly because it deals with only a few policies either in general terms or in relation to specific countries. More importantly, the papers show the paucity of carefully designed evaluations to serve as the basis for meaningful discussion of experience and its lessons for better design and implementation of PA programmes. On the other hand, the discussion of targeting strategies and food-nutrition-poverty relations, recognition of providing social security to the poor against contingencies as an essential ingredient of PA and the attempts to assess alternative PA policy packages in a general equilibrium framework open up several interesting and important issues. Questions relating to the design of institutions for better planning and implementing PA programmes and for more effective targeting, which have not been addressed, are however equally important. But all of this call for much more systematic and sustained research. One wishes that the seminar had considered the lacunae in the current state of knowledge and come up with a research agenda to remedy them.

The Bank, IFPRI and other international agencies spend large amounts on 'poverty research'. But much of it is spasmodic, piecemeal and spotty in coverage. Many of the issues raised in the discussions need for not only theoretical work but, much more importantly, sustained, focused and carefully designed programmes of diachronic and comparative studies of specific schemes in different countries. The best locus for such research is in the concerned countries where costs are also much cheaper than research done by expatriate experts and consultants. There is room for imaginative ways of organising inter-active, multi-country research around a common agenda with participation by international funding agencies. This calls for a willingness to invest more in such research with a long-term perspective and work with and through research institutions in developing countries. But as of now the international agencies which have the necessary funds are hardly interested in such an approach.

Intervention for Environment Protection

Soutrik Ganguli

World Resources 1994-95 by World Resources Institute in collaboration with United Nations Environment Programme and United Nations Development Programme: Oxford University Press, Delhi; pp xii + 400, Rs 295.

THIS guide to the global environment, prepared by a group of experts, has its purpose clearly stated in the first paragraph of the preface as, "to meet the critical need for accessible, accurate information on environment and development. Wise management of natural resources and protection of the global environment are essential to achieve sustainable economic development and hence to alleviate poverty, improve the human condition and preserve the biological systems on which all life depends". This volume has not been a disenchantment in the sense that it has always stuck to this central theme and has substantial research to back it. The 14 chapters (excluding the data tables) have been divided into three sections according to the nature of the topics covered and the first section is of special importance as it focuses on broadly what are the problems and the key remedies to them.

The first section contains three very complex and controversial issues like natural resource consumption, population and environment, and the role of women in sustainable development. These three chapters deserve a special mention as they address the heart of our problem regarding resources, and going through these chapters are bound to change some of our ideas regarding the problems of resource crunch and wastage. But there are a few slips in some of the statements. In the first chapter it is said that according to popular belief lifestyles and the scale of industrial activity only influence resource consumption and its environmental impacts but in reality certain other factors like geographic patterns of production, terms of trade, level of technology and the distribution of wealth also play important roles in the process. But these 'certain other factors' also contribute to determine the lifestyle and thereby get incorporated, though indirectly, in the popular belief. These chapters reveal some surprising differences from conventional wisdom. It is the renewable resources which are most in danger of depletion and it is the industrial countries as a group which consume majority of the resources. But the most endangered resource, petroleum, has been considered an exception here which makes the statement lose some validity. It has been rightly pointed out that poverty and inability to meet basic needs often compel the developing countries to use natural

resources in ways that lead to their rapid depletion.

The chapter on population and environment tries to construct the link between resources degradation, poverty and population growth also mentioning the importance of the social factor. According to the case studies presented in this chapter, wealth distribution, government policies regarding natural resource management, land tenure and the economic environment determine if at all population growth should imply environmental degradation. It is common perception that a 2 per cent population growth rate can be alarming for China whereas a 5 per cent population growth rate can just bring the promise of a better economic environment for Siberia.

This volume has marked the role of women as the critical factor for poverty alleviation and finding environmentally sustainable development paths. Women, though primarily burdened by domestic responsibilities, have been viewed in this study as primary managers of natural resources on a local level. The cultural and religious attitudes, economic and educational constraints coupled with institutional constraints and political powerlessness have acted as major barriers to women's full participation in the society. But they play a fundamental role in checking the rapid resource degradation by putting a break on population boom. More than that they nurture children and hence inculcate values for future generations. So they only can offer sustainability to any development project. To elevate the status of women, this study suggests infrastructural investment on women as a pivotal requisition in any sustainable development plan for the future. The three chapters in section one prove that the environmental and the developmental issues are intertwined and an isolation of any of these issues will render the study incomplete.

The second section deals with two particular case studies on China and India. Both countries have a economic momentum. But constant environmental threats and population explosion can make the growth possibilities sluggish by rendering the two nations impoverished on the resource front.

The third section analyses major arenas like energy, biotechnology, etc, where the environmental problems have crept in. The coverage is definitely wide and the study

detailed, but certain basic questions remain unanswered. The study talks of measuring consumption costs accurately which is quite compatible with the UNCED objective of 'sustainable consumption patterns' where the consumption patterns of the industrialised countries do not affect the consumption pattern of the developing countries. But this involves the inclusion of social cost in the cost profiles of the big industrial houses. Frank Popoff, the chairman and CEO of Dow Chemicals company, has vigorously stressed the need for this (which has been quoted in this volume). But as long as an organisation is the instrument for achieving the goal of profit maximisation, it is difficult to incorporate the social costs of using resources. So until and unless this consciousness is incorporated in the corporate practices this will not serve much of a purpose and this point has hardly been stressed in the study.

This volume asks for a resource consciousness to start from national and local levels because the brunt of resource depletion is first felt at these levels and only after the successful conglomeration of numerous local-level efforts can sustainable policies be pursued at the international level. In this context, the role played by the NGOs has been emphasised. The volume talks of willingness of industrialised countries to support sustainable development in the field of biodiversity in developing countries. But this proposition becomes controversial in the light of the current debate on Intellectual Property Rights. The study is optimistic about the dawn of an era of international governance. As most of the environmental problems are global in nature, a global management of resources has been suggested. For that an expansion of the UN's information base has been suggested. The role of IDA has been highlighted as a source of funds. An important suggestion on diverting the 'peace dividends' to resource management has been made which is appealing but seems a bit utopian. Though the roles played by the international institutions have been stressed, this volume is uncertain about the role UNCED is supposed to play to guide the world towards sustainable development. This comes out in the following statement: "Of course, signing documents does not ensure implementation; the real test of UNCED's success will be the extent to which governments follow up on the commitments they made in Rio".

On the whole this is an in-depth study of the basic problems of resource management and the elaborate data work in section four is excellent and will prove useful to any scholar working on related issues. The beautiful cover illustration of this volume, depicting a Dogon woman drawing water from a well, deserves a special mention.

True Cost of Public Expenditure

Raghubendra Jha

Any listing of the benefits of state intervention in the market place, and hence of public expenditure, is incomplete without a parallel enunciation of the costs of public expenditure. This note examines this question and enumerates the components of the true cost of public expenditure.

IN many countries, particularly ours, several economists have written extensively on the benefits of public expenditure. Any civilised society - prosperous of developing - requires a large public sector. In Adam Smith's classic list,¹ for instance, government expenditure has (1) "the duty of protecting society from the violence and invasion of other societies", (2) "the duty of protecting, as far as is possible, every member of the society from the injustice and oppression of every other member of it, or the duty of establishing an exact administration of justice", and (3) "the duty of erecting and maintaining certain public works and public institutions which it can never be for the interest of any individual, or small number of individuals to maintain". To this we may add a number of items that have become essential since Adam Smith's days. In particular every modern government must deal with externalities such as the protection of the environment and ensure a certain amount of redistribution of wealth and income among its members.

It should also not be supposed that markets will always work ideally - like the textbook model of perfect competition. The local store always has a little bit of monopoly power. Firms are unlikely to provide adequate personal security to workers working on hazardous assignments and externalities crop up almost everywhere. A fair amount of business activity is predatory. Vast resources are wasted in bargaining and lobbying and in corruption. Large firms, sometimes, wield dangerously large amounts of power over the state. Viewed in this light there is little in the private sector that is not tainted with some inefficiency, or that may not be subordinated to some 'higher' interest. Any number of arguments can be advanced for subsidies to various sectors.

Any enunciation of the benefits of public expenditure cannot be complete without an analysis of the costs of public expenditure. The essential point to be grasped is that any listing of the benefits of state intervention in the market place and, hence, of public expenditure is incomplete without a parallel

enunciation of the costs of public expenditure. On this point the advocates of state intervention and higher public expenditure have been less than forthright. In this paper we wish to examine this question and enumerate the components of the true cost of public expenditure.

The components of true cost of public expenditure are the following:

(1) *Resource Cost*, defined as the minimal cost of public activity to the government, abstracting from the effects of dishonesty or want of incentive on the part of public officials and ignoring costs associated with the private sector response to taxation, public services and transfers. The resource cost of running a government school is what must be paid to the teachers, administrators, other workers, sellers of teaching equipment, the electricity and transport company and the like. Thus resource costs would include all purchases of goods and services, regardless of whether these are acquired by contract (when the government hires a consultant, for example), or by employment (teachers, doctors, civil servants and the like) and regardless of whether goods are bought (the air force purchases new planes) or made (when HAL produces new planes).

(2) *Overhead Cost* may be more or less extensive in its coverage. It may include, for instance, the fixed cost of the entire government sector - such as parliament, the state legislatures, the holding of elections and so on. It may be more specific - the cost of fertiliser subsidy, and the food subsidy, for example. These involve substantial overhead costs as the government must have highly paid staff to determine criteria, review performance and so on.

(3) *Deadweight Loss in Taxation*. One of the most significant recent developments in the theory of public expenditure has been the recognition that, since taxes are rarely lump sum, funds for public expenditure must be collected through distortionary taxation which, in turn, levies costs on taxpayers in excess of the amount of revenue collected. This is the so-called Marginal Cost of Public Funds argument. A simple example may

illustrate this point. Consider a mason whose house requires electrical work and an electrician whose house requires structural repairs. Both parties could do both jobs but each is naturally better at his own vocation. The mason can do the job of the electrician in 20 hours but the electrician can do it in 12. Similarly the electrician can do the job of the mason in 20 hours but can do his own job in 12. Any pattern of allocation of work is feasible. Clearly, the most efficient method is for each person to do the job for which he is qualified. In doing so a total of 24 hours are expended whereas the same work could have taken 40. Suppose the wages of masons and electricians are both Rs 20 an hour so that the cost of each job (when most efficiently done) is Rs 240. Let us assume that the rate of income tax is 50 per cent. Each party would now have to earn Rs 480, pay Rs 240 in taxes, and pay Rs 240 to the other party. Given the wage each party would have to work 24 hours to earn Rs 480. Hence each party would find it in his interest to do the job himself - since this involves working for 20 hours only. The mason would do the job of the electrician and the electrician that of the mason. Allocation of work would be thoroughly inefficient. The effect of the tax is, then, for each party to waste 8 hours with a social value of $Rs\ 20 \times 8 = Rs\ 160$. Total loss to society is Rs 320. This is the deadweight loss or excess burden of the income tax. Any undergraduate student of economics knows that, under certain conditions, a uniform commodity tax has the same effect as an income tax. Hence the above arguments would apply to the case of commodity taxes - indeed any distortionary tax as well. It is not very hard to show that, under certain reasonable conditions, the excess burden of the tax - the cost to society in excess of the revenue generated - is proportional to the square of tax. The excess burden goes up ever more steeply as the tax rate rises! Surely, overhead and excess burden are also ingredients of the true cost of public expenditure.

(4) *The Concealment of Taxable Income*. As excess burden rise people might be induced

INDIAN INSTITUTE OF MANAGEMENT LUCKNOW

MANAGEMENT DEVELOPMENT PROGRAMMES (1995-96)

Sl. No.	Programme Title	Duration	Programme Director (s)
01.	Creativity Organizational Excellence	Dec. 04-06, 95	Prof. P.N. Rastogi
02.	Managerial Effectiveness Through Self Awareness	Dec. 18-21, 95	Prof. S.K. Kalra Prof. R.K. Gupta
03.	Workshop on Strategic Management	Jan. 22-27, 96	Prof. Krishna Kumar
04.	Managerial Effectiveness Through Self Awareness	Feb. 05-08, 96	Prof. S.K. Kalra Prof. R.K. Gupta

to reduce supply of the taxed goods and to shift their efforts from taxed to untaxed goods. A similar, and additional, contraction occurs when an increase in the tax rate induces taxpayers to devote extra resources to tax avoidance. People might be expected to devote resources to tax avoidance until the point where the marginal benefit from such avoidance just equals the marginal cost of doing so. Legal tax avoidance and illegal tax evasion have to be placed on the same footing because they are the same from the point of view of the immoral taxpayer. Each entails the non-payment of tax at some cost – the use of resources to discover ways of making income tax exempt in one case, and the use of resources to hide income, together with the risk of punishment, in the other. Each course of action proceeds until the marginal benefit equals the marginal cost and each drives up the marginal cost of public funds because each reduces the tax base. From the point of view of the general public, however, the two are not the same because they involve different amounts of intimidation costs.

(5) *Intimidation Costs.* Virtually any task that the public sector is required to perform involves the establishment of rules which, in turn, require enforcement. Enforcement entails costs which must be counted as part of the costs of public expenditure. Among these costs are the citizens' time and money devoted to evading the rules without getting caught, the cost to the government of identifying infractions of the rules and the cost to the government (and ultimately to the taxpayers) of prosecuting rule-breakers. Intimidation costs become a latent cost of public expenditure whenever an increase in the tax rate leads to increases in public expenditure to enforce compliance with the tax laws. The greater incentive to evade tax can be expected to require a somewhat larger public expenditure to enforce the rules.

Marginal deadweight loss, marginal concealment cost and marginal intimidation cost may be strictly additive as latent costs of public expenditure, although there are circumstances when it is not the case. Strict additivity holds for legal tax avoidance and in the special case where tax evasion is costly but foolproof because tax evasion may involve working in the underground economy where productivity is low.

(6) *Transfers Magnify Deadweight Loss.* We have so far been assuming that all citizens are alike. When we admit of inequalities in the distribution of wealth and income another problem rises. Let us take the case of fertiliser subsidies or subsidies for investment in selected industries. In this case the deadweight loss of taxation is paid by all but the benefits of the subsidy are collected only by a few people. In this case

it is possible to show that, under certain eminently plausible conditions, the benefits to the recipients are more than outweighed by the deadweight loss to all. The full cost to the taxpayers could exceed the full benefits to the recipients of subsidies.

(7) *Waste of Resources in Transfer-Seeking.* An important message we have received so far is that private manoeuvres to avoid tax place a wedge between the marginal cost of tax to the taxpayer and the marginal revenue collected. A similar and additional wedge is created by private manoeuvres in response to public provision of goods, transfers or privileges. Suppose, for example, that society consists of two sets of people – the rich and the poor. Each person has the same probability, at birth, of becoming rich later in life. This probability is a function of the effort put in by this person. The greater the effort the greater the probability that the person will become rich. The rich are taxed at a proportional rate to finance a transfer to the poor. If people could form binding contracts for effort and redistribution of income they would choose full insurance – values of the transfer and effort high enough to ensure that the consumption of both groups of people is the same. But such contracts are not enforceable and the ensuing moral hazard problem dictates that the value of the transfer should be low in order for the tax system to provide an incentive for effort. The essential point is that any selective transfer would create incentives for people to bring about (or not to take steps to avoid) the conditions under which the transfer is granted and that these steps – by lowering effort or by some other means – may bring about a reduction in total national income. Thus, subsidies to industries reduce incentives for these industries to weather true competition. Unemployment insurance reduces people's incentives to search for and retain jobs and the like. As with the deadweight loss in taxation, these private incentives generated by public activity have to be counted as part of the cost of this activity – cost which is worth bearing when the benefits are substantial, but not otherwise.

(8) *Commodity Effects.* Consider a bachelor who works for the government and whose sole motive is to provide for his old age. He retires at the age of 60 and, in the absence of the government pension, would have accumulated Rs 2 lakh worth of capital at age 60. If the government pension provides a stream of income with a present value of Rs 1 lakh on his 60th birthday then it would be rational for this person to accumulate Rs 1 lakh less. If the government pension plan is funded then the reduction of Rs 1 lakh in private saving is made up by an increase in government saving of Rs 1 lakh. If, however, the public pension is not funded

there is no corresponding increase in government saving. What appears to the recipient of the old age pension as a substitution of public saving for private saving may constitute a reduction in saving for the economy as a whole, depending on how the pension is financed.

The same kind of consideration applies to the firm-specific subsidisation of investment. Public subsidisation of investment may be general – when all firms become eligible for a tax credit, for instance – or specific – when firms producing certain goods or employing certain kinds of people (cottage industries, for example) or operating in certain backward areas – get subsidies and/or tax credits.

Firm-specific subsidisation may be socially advantageous in some cases but it is highly unlikely that an ad hoc programme of such subsidisation put together by bureaucrats and politicians will be beneficial on balance. Knowing that subsidies are available firms have the incentive to claim that they satisfy the criteria for subsidisation. From the point of view of the society as a whole, however, a distinction must be made between the benefit of the subsidy and the benefit of the subsidised investment. Clearly, the investment itself must be beneficial on balance for the subsidy to be socially advantageous. An additional, but necessary, requirement for the subsidy to be beneficial is that the investment would not be profitable otherwise. Firm-specific subsidisation may not be beneficial in practice because it is difficult, bordering on impossible, for public officials to determine with any acceptable degree of certainty whether these two conditions obtain in any particular case.

In the absence of such information public officials may have to resort to intuition or judgment or, worse, be swayed by bribes. Such a *modus operandi* removes all possibility of a proper *ex post* audit.

The possibility that firm-specific subsidisation leads to investment that cannot be justified leads us to wonder whether such subsidisation diverts much needed investment funds from genuinely productive and profitable areas. The end use of public expenditure, in this case, is to reduce the volume and effectiveness of national investment and, surely, is a cost to the economy.

(9) *Rent Seeking.* The term 'rent seeking' is usually employed in the context of quotas rather than of public expenditure, but the basic principle applies to both. Whenever the government establishes a valuable prize, be it a patent for innovative research, entitlement to an import licence or an industrial subsidy granted on any principle whatsoever, incentives are set up for people and firms to employ resources to acquire these prizes. A contract yielding Rs 10 lakh

as profits is awarded at random to a 'suitable' firm, where suitability refers to the acquisition of a machine that costs Rs 1 lakh via an import licence. This machine has no use whatsoever apart from the contract. If only one firm buys the machine, that firm is sure to win the contract and to pocket the Rs 10 lakh as profit. In a free market this profit will be competed away. If firms are risk neutral, this machine will be purchased by 11 firms of which one will be awarded the contract. Of the Rs 11 lakh spent by the 11 firms all but Rs 1 lakh will be wasted. What, at first, appears as a transfer from the government to one privileged firm or lucky firm, turns out to be a social waste in circumstances where ex ante profits are normal.

Rent-seeking is a rather general term that may cover any of the three types of activity: lobbying, bribery, and positioning. Lobbying is, almost always, a pure waste. The same is true of bribery. Positioning refers to the type of behaviour discussed in the preceding paragraph: A quota or some other valuable privilege is allocated by the government to firms on the basis of a property characteristic of the firms, and the choice among eligible firms is entirely random. The acquisition of the property becomes like the purchase of a lottery ticket. Firms position themselves for the prize by acquiring the property.

Sometimes, rent-seeking can be socially advantageous. R and D expenses in order to get a patent is an obvious example. But such instances are rare. Corruption, for instance, is almost always socially wasteful and may take many forms: kickbacks on government contracts, bribes to the police to overlook infractions of the law, selling of offices and of credentials, or demanding payment for the simplest jobs. This is government-wide predatory activity which is, often, indistinguishable from despotic government.

It is sometimes argued that corruption involves no social cost since it is a mere transfer of resources from the private sector to public officials. This argument is generally false because of the tenuousness of the connection between the private gain to the corrupt official and the social loss from his actions. Consider an immoral officer who is weighing the pros and cons of a corrupt act – such as granting one firm a contract that should, by rights, go to another. He benefits from his misbehaviour if it is undetected. He runs some risk of detection and punishment. Like any criminal he acts if his expected gain exceeds his expected loss. But the calculus of the corrupt official does not admit the social gain at all. He is concerned only with his private gain or loss. In particular if the corrupt official is sure

that the corrupt act will remain undetected he will go ahead and do it, regardless of the social cost.

(10) *The Inflationary Tax*. The above factors tend to make public expenditure higher than it should be. When this is the case and, in particular, when expenditure exceeds tax revenues the ensuing deficit is covered by borrowing. If the borrowing is done from the public interest rates rise and crowding out of productive private investment occurs. If the borrowing is done from the central bank of the country the monetary base expands, money supply rises and inflation sets in.

Inflation acts as a very regressive tax since there is imperfect indexation and most incomes are fixed. Moreover, financial markets are affected since cash balances are taxed and financial portfolios are affected.

CONCLUSIONS

In many analyses of the cost of public expenditure only item 1 (resource cost) is mentioned. However, as I have tried to argue the dimensions of the costs of public expenditure are several-fold. In any comparison of the costs and benefits of public expenditure it is necessary that the true cost of public expenditure be kept in mind. In India it is extremely common to expound on the benefits of public expenditure whereas a dispassionate analysis of the costs is rarely forthcoming.

**Institute of Rural Management, Anand
announces the programme on**

MANAGEMENT OF AGRI-BUSINESS CO-OPERATIVES IN DEVELOPING COUNTRIES for Chief Executives and Senior Managers

**February 12 - March 23, 1996
(six weeks)**

The programme aims to strengthen the general management perspective of key personnel in agri-business co-operatives and other rural business organisations from developing countries and to equip them to steer their organisations in the emerging competitive scenario.

Programme Contents:

Design and Structure of Agri-business Co-operatives, Procurement Strategy, Processing Function, Marketing of Agri-Produce, Human Resources in Agri-business, Financing Agri-business, Interface between Law and Co-operatives, Strategic Management issues in Agri-business, Executive Effectiveness, Managerial Politics.

Programme Fee:

Rs.50,000 for Indian participants & US \$ 3,000 for others.

Nominations will be accepted until December 30, 1995.

Human Rights and the Third World

Towards a Reassessment of Ideological Dynamics

M Shiviah

In the aftermath of the failure of the Soviet Socialist experiment, the victorious social liberal (capitalist) camp led by the US is taking a narrow view of 'human rights' in the third world, policing the observance only of civil and political rights. The affluent countries accept social and economic rights for their citizens via the welfare state but deny the same to the rest of the world. Third world countries should struggle for an international declaration and programme of human rights in the broader sense, including rights to resources, food, education, health, and a clean environment.

I

IF democracy is meaningless without civil and political rights, so is socialism with any credible claim to the deeper humanistic moorings of Marxism. The tragic failure of the Soviet experiment on this score seems to have eclipsed its historic achievements in furthering the cause of economic and social rights. Among their global spin-offs, not the least important one was the transformation of the old, *laissez-faire*, liberal state into the new, social liberal (welfare) state.

Notwithstanding the high visibility and close proximity of this transformation, the victorious social liberal camp (technically more appropriate than the polemically more provocative 'capitalist camp'), led by the US and some affluent west European countries, is taking a cock-eyed view of human rights *vis-a-vis* the third world. Still in the coils of a celebratory mood, it is exploring opportunities for 'policing' the observance of 'human rights' in their narrower civil and political versions. In the murky world of *realpolitik*, interest in these versions is often accompanied by a keener interest in the economic advantages of 'structural changes' in the third world. Let it be stated clearly that while the dimension of global environment, or 'compulsions', is there, the case for structural changes might rest on their intrinsic merit, viz, the impetus to economic growth in third world countries. The critical note struck above is not directed against structural changes as such, but against a selective approach to human rights. Countries and social segments adversely affected by it might well develop a cynical posture and ridicule civil and political rights for their supposed rhetorical content. Those on the other side might develop a similar attitude towards economic and social rights for a different set of considerations. In situations of cross-fire, the adverse consequences for human rights – a core asset of human civilisation – could be unpredictable. It is, therefore, time to take stock of things, and to see whether such an exercise yields useful insights for policy and action.

In the modest compass of a paper such as this, only a preliminary analysis can be attempted. The issues are many and complex,

particularly those impinging upon economic life and political processes. We have selected the following issues for discussion in the belief that they need to be addressed first for a better appreciation of the vital political dimension, and that such an approach would be an advantage for economists better equipped to tackle economic issues. A certain tentativeness and vagueness in their formulation is a reflection of their complexity. They are broad enough to permit considerable freedom for interspersing reflections and analytical exposition. Given the conceptual amplitude and historical span of the issues, this kind of freewheeling discussion might entail jarring gaps in neatness. The price may be worth paying for the sake of exploratory gains, with subissues popping up and aiding a more nuanced discussion in some contexts. They (the issues) may, therefore, be regarded as signposts at unevenly spaced turning points, rather than as indicators in a well-designed tourist map.

– Against the background of the significance of the 'bill of rights' tradition, and its recovery and enrichment culminating in the emergence of social liberalism, what are the relative prospects of civil and political rights on the one hand, and economic and social rights on the other? Is the disproportionate emphasis on the former, accompanying a full-throated invocation of faith (in recent years) in the free-market economy, congruent with the ideological imperatives of the (social) liberal state?

– Considering the level of achieved integration between civil and political rights and economic and social rights on ideological and empirical planes, can the social liberal camp go back to the pre-welfare dispensation, or drastically weaken the welfare net?

– If it cannot, how does one view the credibility or plausibility of actual or contemplated efforts to commend to the third world a more restricted package of civil and political rights? Does the overall picture warrant pessimism or optimism?

– If optimism, what political initiatives and institutional mechanisms are needed to concretise economic and social rights on a universal basis? Would such concretisation entail a more critical view of 'economism'?

II

To the extent the subtitle and the above formulations reflect the anxieties of intellectuals in, or empathising with, the third world (an empathy deepened by the ethical bases of socialism), we plead guilty to the charge of initial bias to an extent. After all, even the best of (so-called) value-free exercises cannot escape inarticulate value premises 'in the ultimate analysis'. In the inspiring tradition of liberal political theory, the present exercise seeks to have both a distinct normative content and a sturdy academic orientation. We can only hope that faith in the utility of such discussions in extending the boundaries of a more nuanced and objective appreciation of issues turns out to be rewarding.

The hope derives sustenance largely from the centrality of 'human rights' for liberal political discourse and institution-building for more than two centuries. Notwithstanding setbacks attributable to the exigencies of statecraft, interest peddling by individuals and groups, economic management, and so on, the achieved level of concretisation in political and constitutional spaces should warrant some optimism. The problem, mainly, is one of unevenness. If the focus is on economic and social rights, the achieved level in the first world contrasts sharply with that in the third world. Until recently, the second world was in a fairly happy position *vis-a-vis* these rights, with a disconcerting record of gross lapses/indifference *vis-a-vis* civil and political rights. Its attempts since 1991 to build liberal democratic structures in a situation of crumbling bases of economic and social rights in a number of east European countries might succeed, given an improbably high dose of good luck!

The stakes being what they are, we have to go beyond 'soft' optimism to a keener appreciation of the evolutionary contours of the discussion. When Laski wrote in *A Grammar of Politics*, nearly 70 years ago, that "every state is known by the rights it maintains",¹ he was summing up a historical trend of deep import for the character and future of human civilisation. Their leit motif was human rights, not the glory and pomp of rulers and ruling groups. In the preceding 14 decades, this leit motif had found

expression in the mighty thunders of the French and Russian Revolutions. One does not know if the present upsurge in favour of free enterprise can be described as a revolution, but its leitmotif is palpably different. Projection of 'civil' and political rights' as a concomitant or consequence of free enterprise can be credited with musical qualities in the present ambience. But the deeper issues, particularly those relating to economic and social rights, are being pushed into the background. Are the gains of social liberalism, not to speak of those of socialism, to be sacrificed for the sake of a pre-social liberal dispensation? Will the ball of retrogression, as it were, stop here or move farther back? One hopes that such doubts prove to be untenable in a relatively long-term perspective.

As a source of light and lessons, the past can be far more useful if we refuse to be blinded by the present. The political and constitutional roots of the 'bill of rights' tradition could be deeper and stronger than what its detractors might suppose. Rewinding the reel of history, and looking at the reel from the standpoint of the problems characterising the present, could well be the best way of appreciating the ideological dynamics underlying the operative forces today. Revitalising and fostering the roots mentioned above should be the obvious political plank of those who see in the blighting effects of new conservatism or cynicism a threat to the onward movement of the forces of human development. In this perspective, figuring out the debating points, if not the battle lines, would be a task of no mean significance.

Though the contexts are vastly different, Burke's attack on the French Revolution's 'Declaration of the Rights of Man and Citizen' (1789), in the name of the prescriptive rights of 'tradition', provides a convenient (and hopefully apt) starting point. He described the declaration as the "paltry and blurred sheets of paper about the rights of man".² Paine's rejoinder, premised on a radical shift away from the prescriptive pretensions of the feudal order, contained the forthright assertion: "When I contemplate the natural dignity of man, I become irritated by the attempts to govern mankind by force, as if they were knaves and fools..."³ This was by no means a flash in the pan. Two years before the French Revolution, Jefferson wrote in his letter of December 20, 1787, to Madison: "A Bill of Rights is what the people are entitled to against every government on earth, general or particular, and what no just government shall refuse or rest on inference." The French declaration provided a resounding confirmation of the Jeffersonian 'entitlement' in the following enunciations:

(i) "Ignorance, forgetfulness, or contempt of the rights of man are the only causes of public misfortunes and of the corruption of governments".

(ii) "Men are born free and equal in rights. The aim of every political association is the

preservation of the natural and imprescriptible rights of man: liberty, property, security and resistance to oppression".

These enunciations reverberated through the corridors of history in subsequent decades practically all over the world. Burke's 'age of chivalry', with its feudal prerogatives and privileges, receded into the limbo of history never to appear again, unless one believed in some congenial cyclical theory of history. The emancipatory gains of the liberal revolution *vis-a-vis* the antecedent feudal order, are here to stay in large parts of the world; civil and political liberties, despite their price of eternal vigilance against enemies, are doubly secure in terms of the roots they have struck in constitutional systems, and in the psyches of hundreds of millions of people the world over. If the ball of 'retrogression' strikes this great historical divide, some retrogressive ballast might well be lost on the rebound. Such indeed is the legacy of the French Revolution to mankind.

The poor and the exploited of the world, particularly those belonging to the third world, might wish for a similar protection *vis-a-vis* economic and social rights. As a major historical referent of such aspirations, the Russian Revolution, despite what has happened in the former Soviet Union, continues to exercise more than symbolic fascination. After all, until yesterday the 'socialist camp' meant so much for global history. We are, however, concerned here with a more modest proposition: social liberalism – something within the 'free world', opposed to the Soviet Union – centred power configuration. Are the achievements of the social liberal dispensation too in peril? Now that its *bête noire* is down, will it resile, as if on the rebound, from some of its earlier commitment to economic and social rights? This question may not be a product of sick imagination, for the free enterprise chorus includes some harsher notes against welfarism too.

With quite a few romantic illusions lying shattered, recent events should compel keener attention to the darker side of human nature in politics, notwithstanding the spectacular success achieved in the direction of realising 'utopia' since the publication of Thomas More's book bearing the title. As the cause of human rights, fired into the orbit of history by the French Revolution, wended its mighty course through the tortuous streams of hypocrisy/opportunism/expediency/prevarication/betrayal, cascading through revolutionary rapids in between, the zigzags of history have left quite a few scars on the course of liberalism and socialism. In spite of them, the net gains made by the liberal agenda of human rights have a securer base now. The socialist agenda did not register comparable gains, partly because it made heavier demands on human nature, and partly because in the feudal order liberalism had a simpler adversary both politically and economically. As an adversary, the liberal-capitalist order was far more complex and

sophisticated; because of the shared ground of industrial civilisation and human rights, a love-hate relationship has had, quite often, the better of a simple adversarial one. The deflecting mirrors of nationalism and imperialism, becoming more hideous in several instances on account of atavistically feudal forms of religious or racial identities, made the equations even more complex. Somewhere along the course of intertwining from the 70s of the 19th century, radical liberals and moderate socialists have been casting affectionate glances at each other. At the other end of the pole, those swearing by Marxism took a confrontationist stance for decades. We have now the wisdom of hindsight to suggest that the plank of abolition of private poverty, inherited by Marx from More and Babeuf, turned out to be more complex than anticipated. The progressive liberal side showed a shrewd awareness of subtle changes in forms of property and economic organisation generated by an increasingly sophisticated industrial civilisation. The rougher edges of dogmatism in the Soviet camp weakened the capacity for a more nuanced response on the other side. As the plank is too intricate for fundamentalisms on either side, we leave it at that, noting that what we are left with at the present juncture is the 'mixed bag' of social liberalism.

The mixed bag might give the impression of being a simpler proposition. To save ourselves from superficiality, let us look at another part of the rewound reel of history more closely. The scene: the Great Depression, followed by frenzied attacks on the liberal state by Nazi and Fascist regimes. Together, they summed up the severest crisis in the career of the liberal-capitalist formation. Hitler's brazen assertion that the masses "feel inwardly more satisfied by a doctrine, tolerating no other beside itself, than by the granting of liberalistic freedom with which, as a rule, they can do little, and are prone to feel abandoned", found more than an echo in Mussolini's war cries: "Fascism has taken up an attitude of complete opposition to the doctrines of Liberalism. (A)ll the political hopes of the present day are anti-Liberal, and it is therefore supremely ridiculous to try to clarify this sole creed as outside the judgment of history, as though history were a hunting ground reserved for the professors of Liberalism – as though Liberalism were the final unalterable verdict of civilisation". He went on to claim that "the conception of the Liberal State is not that of a directing force... but merely a force limited to the function of recording results"; in contrast, he described the fascist state as an 'ethic' state.⁴

Devils are exceedingly clever at the game of distortion, but their rantings are not always devoid of insight. Both Hitler and Mussolini touched a raw nerve in the body politic of liberalism. The former had a keen perception of the point that liberalistic freedom would mean little if the people felt that they had

been abandoned; and the latter assured the liberal state for its failure to go beyond the function of recording results, and for not being the 'ethic' state. True, they used all the cleverness at their command to exploit the urge for a 'positive state', to put a turgid philosophical gloss on the ideology of rabid nationalism. In the event, liberalism could survive its gravest crisis only by jettisoning *laissez-faire* capitalism (J M Keynes' book, *The End of Laissez Faire*, published a few years before the Great Depression set in, provided a tell-tale anticipation), and by evolving into social liberalism, i.e. a kind of radical liberalism which, while committed to civil and political rights, was alive to economic and social rights as well. Though the contents of the mixed bag bore the marks of a bumpy journey, the new liberal state, to use Laski's test, came to be known for the following rights it sought assiduously to maintain: the former set included the right to life, dignity, liberty, equality, security of person, and property, freedom from torture and arbitrary arrest, and freedom of thought, conscience, religion, opinion, expression, assembly, association, movement, etc; and the latter: the right to work for a fair reward, form and join trade unions, rest and leisure, health and well-being, social security, and participation in cultural life. FD Roosevelt's description of the new dispensation (economic and social rights) as the 'Second Bill of Rights' showed a keener perception of the epochal divisions of modern civilisation than has a lot of jargon-ridden economic analysis published then and since.

Flying the second bill of rights atop, the ship of the welfare state cruised through the ideological high seas with spectacular success for nearly a quarter century – success in terms of high economic growth rates as well. Later, problems on the growth front occasioned re-examination. Before we touch upon that at a later stage, we may ask if the crisis faced by socialism now is of a graver variety than that faced by *laissez-faire* liberalism in the 30s? Hardly, if one does not seek in the 'comparisons are invidious' proposition an easy escape route. Assuming that it is graver, should socialism pack up and quit the scene to the greater glory of free enterprise? If fundamentalist positions are not allowed to cloud reason, one can say with some confidence that it (quitting) may not be necessary. The liberal-capitalist camp did not allow *laissez-faire* fundamentalism to block the process of its renewal then, by travelling on the road of accommodation right up to the socialist end; the historically influential Beveridge Report went to the extent of declaring that it had an 'open mind' on such a crucial issue as 'nationalisation'. Given the will to survive and serve, socialism too should be capable of renewal.

A degree of optimism on the future of economic and social rights would depend upon the ideological influence which a renewed and revived socialism could exert. It can derive considerable help from the

trend of institutionalisation of the second bill of rights since the end of second world war. For the first time in human history, a world body, the United Nations, proclaimed in its Charter (1945): "We the Peoples of the UN, determined to reaffirm faith in fundamental human rights, in the dignity and worth of the human person". The poignancy of the Charter derived not only from its global span, but also from the fact that it came in the wake of the defeat of the Nazi/Fascist challenge to liberalism. Above all, it represented a resounding repudiation of Burke's position on prescriptive rights. This should serve to underline the potential for harm of conservative liberals/liberal conservatives who might seek to buttress their elitist disdain for human rights, particularly economic and social ones, with the prescriptive ambience of the feudal past. For them, Brownlie's following comment on the significance of the Charter could be a basis for rethinking: "A major achievement of the draftsmen of the Charter of the United Nations was the emphasis of the provisions on the importance of social justice and human rights as the foundation for a stable international order".¹

More comprehensive, and more important from the standpoint of those on the lookout for a parallel to the historic French Declaration, was the 'Universal Declaration of Human Rights', adopted by the General Assembly of the UN on December 10, 1948. The declaration raised the banner of social liberalism higher still, sanctified the second bill of rights, and projected it onto the world stage. The enunciations – "every one... has the right to...social security" (Art 22), and to "work...and protection against unemployment" (Art 23) – serve not only as universally visible ideological beacon lights, but also as guides for practical initiatives. The value of these enunciations depends upon their incorporation into the constitutional systems of sovereign states all over the world. While the goal is still fairly distant, reiterations and refinements at numerous regional/international conventions can be drawn upon to bring the goal closer to achievement. Thus, the Social Policy (Basic Aims and Standards) Convention of the ILO (1962) called upon member states to 'declare and pursue, as a major goal, an active policy designed to promote full, productive and freely chosen employment'; the European Social Charter (1961) invoked the ideals which are 'their common heritage' for 'further realisation of human rights', through, *inter alia*, protection of the rights to work, social security and benefits from social welfare; the Second Conference of Independent African States (1960) drew pointed attention to the incompatibility between alien domination and exploitation, and fundamental rights; the African Charter on Human and People's Rights (1981) emphasised the right to education; the Additional Protocol to the American Convention on Human Rights in the Area of Economic, Social and Cultural

Rights (1988) reiterated the right to work and social security, with interesting references to the rights to 'adequate nutrition' and 'health environment' as 'the means for living a dignified and decent existence',¹⁰ and the Chapter of Paris for a New Europe (1990) of the Conference on Security and Co-operation in Europe (CSCE) asserted that economic liberty, social justice and environmental responsibility are indispensable for prosperity, and issued a call to all nations of the world that the CSCE was "ready to join with any and all the states in common efforts to protect and advance the community of fundamental human values".¹¹

Will all the states join in common efforts to protect and advance the community of fundamental human values in their bearing on the solemnly, and frequently, affirmed economic and social rights? If the answer is 'yes', these rights will almost be as safe as civil and political rights. 'Almost', because the 'economic capacity' argument can pose formidable, though not insuperable, difficulties. Evolving a more efficient system of economic management to achieve the needed economic capacity may not be awfully difficult in the context of 'Third Wave' technologies. But bringing about a situation where states join together to evolve a common political plank for economic and social rights may appear to be a remoter possibility. The problems are, therefore, political rather than economic. A major responsibility for this rests with the social liberal camp. It can, and should, play a facilitative role, in the spirit of the call issued by the CSCE in 1990, by enabling the third world to acquire the economic capacity to give effect to economic and social rights.

The bases of ethical support for human rights in general are clear enough. So are, in a sense, those of legal support. Commenting on the legal significance of the UN Declaration of Human Rights, H Lauterpacht said in 1950: "The individual has acquired a status and stature which have transformed him from an object of international compassion into a subject of international right". Paul Sieghart describes this declaration as a 'veritable revolution in international law'. He goes on to assert that as human rights inhere in human beings 'inalienably', they 'could not be abridged, denied, or forfeited by even their sovereign rulers'.¹² The authority of regional conventions, subscribed to by the member states, does not lag far behind. Adverting to the European Convention on Human Rights, Blackburn observes: "Although technically the Convention is no part of Britain's law, it is with increasing frequency that judges do in fact refer to its human rights principles for *persuasive authority*, to help explain the moral issues in the case before them and how British law fits into these principles".¹³

These good tidings, these nicer points of international law, may not add up to much in the field of economic and social rights

if sovereign states are either unwilling or unable to provide the needed constitutional and economic back-up. All the same, they mean a net addition to the stock of optimism. On this basis, one might hope to see a situation in which the current disproportionate emphasis on civil and political rights could be contending with the correctives of social liberalism. In the social liberal camp application of such correctives would be a relatively easy proposition, for it will be a case of activating what they already have. Perceptions of incongruence on account of the 'disproportionate' emphasis will have a higher degree of visibility and plausibility here. However, because of weaker economic sinews, the third world countries will find it difficult to emulate those in the first world. Their problems will get compounded if the latter choose to jettison welfare economics on grounds of either its 'inefficiency' or its incompatibility with the ideological effervescence of victorious capitalism. Allied with *realpolitik*, the temptation to make a faster buck by exploiting the vulnerabilities of the third world countries might become irresistible. Neither the lessons in *realpolitik* nor the excuses for such temptation, will be in short supply, if one cares to draw upon history, particularly that involving the imperialist phase. When that happens, the mercury in the pessimism column will shoot up. Appeals to good sense of the powerful, invoking the ethico-legal principles set forth above, are more likely to fall on deaf ears.

In the end, we are still left with fluctuations in the optimism and pessimism columns – a poor warrant for hazarding a categorical response to the first issue. The unfolding scenario might, at best, reveal three possible stances: we will cross the bridge when we come to it, accompanied by a cynical view of short-term gains; the social liberal dispensation, despite some problems, is good enough to be continued, and extended to other parts of the world; and it is time we respond to the call of CSCE (1990), and act with a sense of vision, reflected in speed, to create the conditions for "living a dignified and decent existence" for all human beings. With 'power' as a major intervening variable, these stances may appear to be too logical for the zig-zags of real life. However, to the extent they are not relatable to whimsicality, a deeper appreciation of the ideological dynamics in the social liberal camp in relation to the third world would be more helpful in figuring out the nuances of the present debate.

III

The ideological dynamics of the social liberal (welfare) state revolve around the actual or perceived nexus of liberalism with capitalism. Those who conceptualise its detachability from capitalism, try to explain, or explain away, the conventionally assumed historical association between them as

something circumstantial rather than intrinsic. With mainstream socialism, deeply anchored to Marxian perceptions and tenets, down (and 'hopefully' out from the standpoint of adversarial capitalism), such a conceptualisation may sound more plausible than it did earlier. It is social liberalism which holds the ground now, and would, therefore, claim a lion's share of political attention.

In a book published in 1977, Massimo Salvadori draws attention to the distinction, in French between 'liberiste' and 'dirigiste': the former "denotes the free enterpriser dedicated to *laissez-faire*", and the latter "the free enterpriser conscious of the defects of a market economy and committed to their elimination through the action of public powers – from the central government down to municipal authorities".¹⁴ To him, liberalism is more egalitarian than is customarily conceded by its socialist critics. He maintains that "the term 'bourgeois' continues to plague liberalism in spite of the extension to all citizens of the liberties advocated by liberals"; that (as a part of this extension) incorporation of universal suffrage transformed the erstwhile liberal government into 'liberal democracy'; that "the diffusion of property, not its abolition, has been advocated by progressive liberals as a solution to the perennial problem of the relationship between the haves and havenots"; and that the blame for visualising 'the good society' as the one which was elitist and therefore unequal should be placed at the door of "constitutional conservatives alien to the liberal tradition".¹⁵ And so on right up to the emergence of social liberalism, and thereafter echoes of the 'managerial revolution' thesis in: "For liberals, capitalism as the system in which capitalists have the upper hand belongs to the past".¹⁶

Now that bitter 'paradigmatic struggles' also belong to the past, one might go along with Salvadori for considerable length. Even so, the effusiveness surrounding the chorus of free enterprise could create a nagging doubt: Is not the very disappearance of 'paradigmatic struggles' a factor tilting the balance in favour of liberiste liberalism? If "constitutional conservatives alien to the liberal tradition" could push liberalism in the direction of elitism, where is the guarantee that latter-day conservatives (like the followers of Milton Friedman?) would not push dirigiste liberalism towards liberiste liberalism? These are vital issues from the standpoint of the third world. A new version of elitism will spell gloom for its teeming millions. As it is, 80 per cent of the world's resources are believed to be consumed by the affluent countries accounting for 20 per cent of the world's population. The situation has a parallel in the internal equations in the developing world: in India, for example, a comparable '20 and 80 per cent' picture is accentuated by the deeper inequities and indignities of the caste system. If the elites everywhere make common cause, the ideo-

logy of the welfare state along with its gains for the poor and the weak could be jettisoned through an elitist gloss over free enterprise. The setback to the cause and content of economic and social rights could be severe.

Has the 'liberal tradition' any built-in protection against such distortions or regressions? Now, a 'tradition' is not a simple thing; it is a "family of disagreements, and not a single view".¹⁷ Like in so many other cases, lexicographical definitions might be better guides to reality than stipulative ones. According to *The Random House Dictionary*, tradition is that which is handed down from generation to generation by word of mouth or practice (emphasis added), spanning beliefs, customs, etc. Can we discern some dominant or distinctive trend in the liberal tradition, identified as practice, shaped by a coherent set of views or beliefs? Those who would be reluctant to say 'yes', could invite our attention to the inconsistencies, tardiness, responsiveness of the fire-fighting variety, the tendency to sacrifice liberal sensibilities at the altar of economic gain or efficiency, opportunistic rather than principled alliances with conservatives or progressives, and an ambivalent distance from equality, and so on, which have presumably characterised the liberal tradition. Add to this the logic of the 'western state system' in modern times, we have a complex of perceptions which would be grist to the mill of cynicism rather than vibrant faith. A well known political scientist belonging to the 'realistic school', Hans J Morgenthau, has some home truths to tell: "It is a characteristic aspect of all politics, domestic as well as international, the frequently its basic manifestation does not appear as what they actually are – manifestations of a struggle for power. Rather, the element of power as the immediate goal of the policy pursued is explained and justified in ethical, legal terms. That is to say: the true nature of the policy concealed by ideological justifications and rationalisations". "Colonial imperialism, in particular, has frequently been disguised by the slogans of the kind" – "the blessings of Western civilisation", "the white man's burden", "the national mission", "manifest destiny", "Christian duty", and so on. The supreme irony of the following situations cannot easily be missed. "Napoleonic imperialism swept over Europe under the banner of 'Liberty, Equality, Fraternity'". "Russian imperialism, especially in its aspirations for Constantinople and the Dardanelles, has successively or simultaneously made use of the Orthodox faith, Pan-Slavism, world revolution, defence from capitalist encirclement."¹⁸ In fact, the impact of "the concept of interest defined in terms of power"¹⁹ is too pervasive to be limited to international politics.

As realism is not all in human affairs, one might speculate about the relative mix of vision and necessity in the emergence of social liberalism. The conservative government in the UK is being satirised for

going back on its promise not to tax with the quip: "We tax not because we want to but because we have to". Did the historic initiatives of the New Deal era have any resemblance with this? To an extent, 'yes', because liberalism was facing then the severest crisis of its career. The Great Depression seemed to vindicate Marx's prognosis of capitalism as something crisis ridden (booms and depressions) and doomed to collapse under the weight of its own contradictions. The challenge posed by Nazism and Fascism to the survival of liberalism has already been discussed. The situation then could invite the wisecrack: "They transformed liberalism into social liberalism not because they wanted to but because they had to". To the extent this is plausible, the finer qualities attributed to liberalism by Salvadori (*vide* In 15) would seem to have an element of overstatement in them. This does not mean that Salvadori is entirely wrong. On the other hand, he is substantially right. There have been great displacements in the evolution of humanistically inspired ideologies like liberalism and socialism, practically all along the way. Yet, this very source of inspiration (humanism) imparts to them a deeper sense of vision about human development, and makes them qualitatively different from anti-humanist ideologies. Apart from the compulsions of events in the emergence of social liberalism there was this shared ground of humanist vision; in the idiom of 'rights', a shared ground between 'civil and political' and 'economic and social rights'. A preliminary awareness of this ground, understandably dim in the beginning, was shown in Europe from the early 70s of the 19th century. In a situation of prolonged insensitivity to the sufferings of working classes, culminating at times in the extreme callousness of 'social Darwinism', Bismarck (good 'autocratic' company for liberals) showed some 'social liberal' responsiveness in the form of 'social security' and other 'positive' measures. As a minister in the Liberal government, Winston Churchill struck a warmer note in the first decade of this century. In his book, significantly titled *The People's Rights* (first published in 1907; mainly an attack on the Conservative position *vis-a-vis* the House of Lords), he observed: "I believe that Liberalism mobilised, and active, as it is today, will be the principal and indispensable factor in that noble evolution (towards a 'fair Utopia')". "I am of opinion that the state should increasingly assume the position of the reserve employer of labour ... No view of society can possibly be complete which does not compromise within its scope both collective organisation and individual initiative." A programme formulated by him in December 1908 (and supported by cabinet) included the following items: Labour exchanges and unemployed insurance; national infirmity insurance, etc; modernised poor law; railway amalgamation with state control and guarantee; and

education compulsory until age 17. The political significance of such a stance can be better gauged from the remarks of Cameron Hazlehurst in the 'Introduction': "But by invoking the socialist spectre, the Liberals unintentionally hastened a political transformation which they were to prove incapable of controlling".²⁰ Several cuts above this in the positive state ideology was the Fabian movement whose contributions must have had some impact on the kind of thinking reflected by Churchill. And what George Bernard Shaw, a leading light of this movement, noted in 1928 (before the onset of the Great Depression) should be of serious interest to students of ideological dynamics. "Mr Keynes dismisses *laissez-faire* contemptuously as an exploded fallacy." The reference was to Keynes' book, referred to earlier, published a couple of years earlier. Interestingly, Shaw put Keynes in the lineage of John Stuart Mill, Cairns and Ruskin.²¹ That says something about the roots of social liberalism stretching over a longer period of history than is ordinarily acknowledged.

Their roots in the psyche of the social liberal west go deeper to the extent 'vision' ("of that noble evolution towards a fair Utopia") has survived the refractoriness of human nature and the inadequacies and inertia of socio-economic-political institutions. As adult franchise, universal literacy and access to mass media advance their cumulative educational task, the vision seeps into popular consciousness, projecting reference points for 'auditing' individual behaviour and institutional mechanisms. The machinations, even the might, of rulers and their henchmen would be increasingly ineffective against such auditing. The following observation of L T Hobhouse in his well known book on *Liberalism* at a time (around 1909) when social liberalism was in its infancy, applies with greater force to the New Deal era and to the subsequent period: "[The] vision of justice in the wholeness of her beauty kindles a passion that may not flare up into momentary scintillation, but with the enduring glow of central heat".²² Viewed against this background, 'economic and social rights' as the bottomline of a civilisational enterprise built on the foundation the material for which was supplied by 'Utopian' thinkers from More to Marx, would be difficult to erase from the balance sheet of history. If More were to survey the western world in mid-20th century, he would not only have been pleasantly surprised by the way 'economic and social rights' were being actualised, but also by the power of utopia to shape realities, and vice versa.²³ Old stereotypes about reality and realism are no longer tenable. The evolutionary compulsions behind the reality of social liberalism cannot be understood through a 'realism' uninformed by the imperatives of human rights. Saner voices in the (developed) social liberal camp are deeply conscious of this. The developing world, where these imperatives have greater

relevance, may be less fortunately placed for the time being. To borrow the resonant language of the feminist movement, the oppressed and the exploited people of this world too will be able to "break out of the imposed reality (of men as the metaphor for the powerful) through to a reality they can define and control themselves".²⁴ Given the universalistic thrust of human rights, the historic dimensions of the efforts to 'break out of the imposed reality' may be measured in the decades to come in terms of billions rather than millions of human beings.

Until such a situation emerges, the powerful can hardly be expected to forge the art of honing the tools of exploitation and oppression. Among them, the most intricate and confusing are the economic ones. The failure of socialism on the economic front has brought into sharper relief the claimed/demonstrated superiority of free enterprise as an engine of economic efficiency. The important issue at this juncture of history is: Is there any possibility of the 'exploded myth' of *laissez-faire* reincarnating to the detriment of economic and social rights? The decline of faith in the prowess of Keynesian economics, after a successful run for about a quarter of a century to solve the intractable problems of inflation, recession and unemployment, does cause anxiety. But the lack of a sounder alternative further aggravated by environmental problems, has plunged economic theory into a state of crisis. Some episodic experiments inspired by the school led by Milton Friedman, have produced mixed results of a rather funny kind: "There is very little, if any, correlation between monetary policy, credit, and interest rates on the one hand and entrepreneurship, invention, and innovation on the other".²⁵ A bewildered left has hardly had the stamina or creativity to counter the right; its main contribution has been to lend support to the idea of the efficiency of the market with a rider that such efficiency should not be at the expense of socio-economic justices - a somewhat scaled-down version of an earlier, full-throated, song of economic and social rights. Public spending on welfare and social security items became the obvious targets but not to the extent that the economic foundation of social liberalism were gravely threatened. In a perceptive assessment of the impact of Thatcherite policies, Dennis Kavanagh notes, "In spite of such cuts total security spending continued to increase as a proportion of GDP - by an average of 5 per cent in real terms - in OECD states between 1975 and 1985. For all the talk of a tax backlash and attempts to cut state spending on welfare, the irony is that both are now higher as shares of GDP in all OECD states compared with 1975 or 1980." Consequently, "among more radical monetarists and free marketeers there remains disappointment that the government (in the UK) had not done more to shift the middle ground. Such critics want bolder measures

to cut taxation and state spending".²⁴ Keynesian economics may have lost a lot of its original potential for solving the problems of recession and unemployment. But the alternatives preferred by free enterprise 'rightists' have not proved their effectiveness either; free enterprise 'leftists' will continue to retain their ideological relevance and appeal as long as the problems of recession and unemployment underline the historical justification of social liberalism.

Corresponding to the 'free enterprise' rightists and leftists, we can visualise the relative loci on 'civil and political' rights and 'economic and social rights'. The blurring is even more pronounced here – in the purer realm of ideological dynamics. In his classic on *Equality* (first published in 1931), R H Tawney stressed the primacy of the ideological approach over the economic one: "These values and preferences are not something fixed and unalterable. On the contrary, they have changed repeatedly in the past, and are changing today; and the distribution of wealth has changed and is changing with them". This implies "the conversion of economic power, now often an irresponsible tyrant, into the servant of society, working within clearly defined limits, and accountable for its action to a public authority".²⁵ While many today may not go along with him on the institutional capabilities of public authority, his old position on the limitations of pre-welfare liberalism still rings true. "It (old liberalism) condemned the inequalities of the feudal past; it blessed the inequalities of the industrial future". In the 30s, and thereafter, the picture changed qualitatively: "If we speak of equality, we do not mean political equality nullified by social and economic privilege." Above all: "Liberty is composed of liberties. In considering, therefore, the indictment of equality as its predestined assassin, the beginning of wisdom is to specify the particular forms of the former which the pursuit of the latter is held to impair."²⁶

The mood caught on as the crisis deepened. Like the right to equality, the right to life acquired a socio-economic content. Russell W Davenport observed (in 1949): "Violence does not constitute the chief threat to life... When a worker loses his job he cannot eat. Therefore, an economic right must be established." The implications of the right to life for that to property are informed by a similar logic: "This right extends beyond the problem of life and limb to that of economic need; it must include in its meaning the proposition that society shall not proceed in such a way, and the right to property be so construed, as to deny to human beings the possibility of living – that is to say, in modern society, of earning a living." To sum up: "What the people mean by 'welfare' is, precisely, the implementation of the Right to Life." To William Beveridge (of the *Full Employment* fame), the private ownership of the means of production was "not an essential citizen liberty in Britain,

because it is not and never has been enjoyed by more than a very small proportion of British people".²⁹

To say, therefore, that the two sets of rights are equally important is to underestimate their interconnection on logical and empirical planes. Their integration is mediated by two common factors – security and equality; security of life and limb gets restated as socio-economic security, and equality before law gets restated as socio-economic equality (interpreted as equality of opportunity). Such is the force of logic and history behind these gains of integration registered by social liberalism that the possibility of a decisive break with the underlying humanist moorings can be considered too dim for historical prognosis.

This perspective discourages an unduly pessimistic response to the second and third issues posed at the outset. The 'free enterprise' right might try to overemphasise civil and political rights as long as long fits of celebratory excesses last. But pretty soon, it will have to come to grips with the dynamics of forces discussed above, demanding the universalisation of social liberalism rather than its constriction. The first world will not be in a position to give up its social liberal (welfare) plank. Its capacity to commend a pre-social liberal model to other parts of the world, particularly the third world, would be limited by the very forces released by it over the centuries.

IV

The ideological dynamism of the west, especially since the French Revolution, has been a major factor in making human rights the central pursuit of human civilisation. Thanks to this transformation, the third world is more acutely aware of the deeper damage caused by the west's imperialist ways, and is better equipped to participate in the new civilisation. The watchword for the next stage of civilisational advance will be universalisation. In fact, the die was cast much earlier: "It was the glory of the liberal movement," wrote Tawney, "at least in France, to have poured its doctrines into the mould of a universal creed, so that the truths which it propounded were framed, not for Frenchmen, nor for the age of Louis XVI, but for men."³⁰ And Bernard Crick asserts with far greater confidence: "If 'socialism' means anything... it is universalistic".³¹ Allied with nationalism more deeply, the former connived at encouraged imperialism with greater psychological ease. This explains why socialism, despite its own version of goal displacements, has had greater appeal for the third world.

Today, the situation is qualitatively different. Since the end of second world war, there have been conscious and concerted initiatives in the direction of universalisation. The unique significance of the Universal Declaration of Human Rights has deservedly evoked tributes like 'the Magna Carta of mankind', and 'the greatest document in

human history'.³² Some follow-up documents (fn 6-13) illustrate the progress in this direction from the standpoint of economic and social rights. There are many more documents of that type. A heartening feature of the whole story is that many in the advanced countries are unhappy over the slow pace of universalisation. In their 'Declaration on Human Rights' of July 21, 1986, the foreign ministers of 12 EEC countries observed: "The Twelve deplore the fact that countless people around the world suffer hunger, disease and lack of opportunity, thus being denied the enjoyment of the most basic economic, social and cultural rights as well as civil and political rights, which is of paramount importance for the full realisation of human dignity and for the attainment of the legitimate aspirations of every individual."³³ While the 'deplorable' fact continues, the ideological basis for universalisation is a good augury. The general impression that western countries are more enthusiastic about civil and political rights than about economic and social ones may look less tenable against this background. As Julia Hausermann recalls (in the context of the activities of the Human Rights Division of the UN Secretariat): "The initial fear that the Economic Covenant would not be ratified by western states had proved ill-founded with more states ratifying it than the twin covenant. As of September 1, 1987, the former had been ratified by ninety states, eighty-six of which had also ratified the Civil and Political Covenant."³⁴

The gap between the deplorable fact and the admirable principle (formally) accepted on such a wide scale, may be taken as an illustration of the inevitable tension between aspiration and achievements. Some touchy persons get so annoyed with the gap that they develop contempt for the principles. For them, Jose Figueres, a former president of Costa Rica and an economist, had some wise words at the International Conference on Human Rights, held in Teheran in 1968: "If it had not been for the enunciation of principles that were difficult to fulfil, the progress that has been made by these nations would not exist, and probably the vices of dictatorship would be officially sanctioned today." Further, "ethical codes have always preceded ethical conduct. A certain time is needed for education and adaptation. Even afterwards, perfection is never attained."³⁵ The weight of consensus behind the enunciations discussed above imparts to them the character of settled principles. Let us remember that even within the framework of an individual state, and notwithstanding the claims of liberals on behalf of their ideology, some segments, such as blacks in the US, had to wage prolonged struggles to win the battle of human rights for all. The 'liberal conscience' took quite a bit of logical and political nudging to be awakened! The world as a whole has benefited by such nudging in different advanced democracies. Viewed thus, the consensus in favour of

universalisation of economic and social rights, posited, of course, on civil and political rights, can be considered a development of the highest significance in the evolution of human civilisation. Recalling a reference earlier to the reality-shaping potential of utopias, we may note that the 'settled principles' represent a great advance on the road to realisation. It is no mean tribute to describe them as 'soft law'. But the situation is actually better than that. As one writer asserts: "To the entrenched sceptic who dismisses this as 'soft law', the reply now is to point to judicial decisions which make such basic rights as freedom from slavery and racial discrimination binding on all states."¹⁶

The principles are ripe for implementation. What needs to be done at this stage, largely beyond that of 'education', is to figure out the political initiatives and administrative instrumentalities appropriate to the situation in the third world. Their ideological compass may produce the following reading.

(1) In most countries of the third world, imperialism has left deep economic scars, including those with a bearing on environment. Notwithstanding the ideological 'gift' of the weapon of liberalism, and a certain political capacity to figure out goal displacements with or without the help of socialism, imperialism has meant a legacy of indefensibly wide global disparities. The cause of distributional equity, at the core of social liberalism, has suffered grievously at the hands of a more intense kind of exploitative and exclusionary dispensation of politico-economic policy. As long as they lasted, racial/national/religious forms of arrogance fuelling imperialism constituted grave violations of human rights. The sombre picture of poverty and misery in most countries of Asia, Africa and Latin America, aggravated by gaps in distributional equity, should not be tolerated by a world committed to the tenets of social liberalism. In the words of the Brandt Report, the North-South divide is 'the great social challenge of our time'.¹⁷ The fact that the richest countries of the world, accounting for 20 per cent of its population, consume 80 per cent of the world's resources tells a lot about the case for a sharper focus on economic and social rights. Ritual obeisance to civil and political rights, without this focus, sounds like a cruel joke: Imperialism peeping through the politics of human rights!

(2) A related aspect is the equally disconcerting dimension of the problem of third world debt. According to some, the art of 'doublespeak' has been responsible for a favourable gloss on the problems of the affected countries. "By the lenders' own favoured criterion of success ('the restoration to credit worthiness')", says Mike Faber, "the collectivity of debt-troubled countries are now (1989) some 40 per cent worse off than they were in 1982..." The IMF, by adopting the gross GDP criterion, instead of the net GNP one, artificially boosts the gains of the debtor countries; for a correct picture

substantial downward adjustments would be necessary. And "when all debtors are advised to increase exports of identical commodities, as a result of which prices fall, (and) debtors are worse off..."¹⁸ Citing the case of Latin America, Miguel Olea draws attention to the following facts: "The Latin American debt has increased by more than 400 per cent in the last ten years. From 1975 onwards the accumulated debt increased by an average growth rate of more than 20 per cent annually. During the same period, the ratio of service payments to export income increased from 26.6 per cent to more than 65 per cent. What this means is that the debtor countries run the risk of going back several decades in their development and welfare..."¹⁹

(3) The recently signed multilateral GATT Agreement, and the controversies preceding and following it, may stand on a different footing, considering the near universal acceptance of free trade across the globe as something conducive to economic growth the world over. There is a corresponding disapproval of protectionist barriers. But here too, the powerful countries (particularly the US) are trying to use their clout in ways palpably harmful to the economic interests of the poorer countries. Addressing a meeting of the Interim Committee of the IMF, held in Washington on April 25, 1994, the governor of India's Reserve Bank made the following points: (i) While developed countries have reduced tariffs and opened their borders for trade, many industrialised nations have strengthened tariff and non-tariff barriers, particularly against imports from developing countries. (ii) There has been a steady decline in the international prices of commodities exported by the developing world – for 1993, the loss on account of falling prices was more than double the amount of net aid received by it. (iii) The tendency in the west to link unrelated issues, such as labour standards, social conditions and environment to the new trading regime worked to the disadvantage of the developing countries. (iv) The pursuit of macro-economic stability necessitated the balancing of different objectives, like fiscal deficit, trade and tax reforms, etc, as also the desirability of providing effective safety nets to disadvantaged sections of society.²⁰ One cannot help noting here the link between 'effective safety nets' and maintenance of human rights in their economic and social aspects.

(4) Ironically, the sanction of human rights is invoked by the self-appointed policeman of the world – the US – to pressurise threshold nuclear power countries to sign the Non-Proliferation Treaty, while it and its allies remain free to use nuclear blackmail to secure their strategic objectives. If the history of imperialism (dotted with numerous instances of amoral policies and conduct) is any guide, it is these powerful countries which need be disciplined first. The enormous amounts saved through drastic cuts in defence budgets can be used to concretise economic

and social rights for mankind as a whole.

Viewed in the light of the ideological dynamics outlined earlier, the task of deriving an action plan from the meanings embedded in these readings should not be difficult. On the top is the pursuit of effective safety nets to the disadvantaged. The subdued tone of India's bank official, apart from the style of a civil servant, is largely attributable to the high volume of free enterprise chorus and the fear of displeasing those powers who might use 'sanctions' to discourage discordant notes. This, however, does not mean that third world countries are incapable of appreciating, or taking advantage of, the opportunities offered by the new dispensation of free enterprise. But they also perceive economic and political risks against which the 'welfare net', already available to the rich countries, is expected to provide a degree of protection. In a more propitious international political climate, they are likely to assert this position in a more forthright language. At the recent G-15 summit held in New Delhi in the last week of March 1994, the prime minister of India stated that "our absorption in the task of today will not come in the way of our seriously addressing the emerging and transcendent issues of tomorrow... We shall exemplify the intrinsic symbiosis between the interests of industrialised countries and ours." The president of Nigeria made a strong plea for poverty and hunger alleviation projects in the third world, and delivered, as it were, the punch line: "If we succeed and can demonstrate beneficial results, then we shall be further strengthened and justified." And those who should may draw appropriate conclusions from the generous ambit of his observation: "We should avoid the earlier experience of some international organisations and groups whose efforts became mired in controversy, isolated by excessive rhetoric and crippled by their inability to demonstrate practical results." Can the present 'free enterprise' – centred efforts, also characterised by excessive rhetorics, escape being mired in controversies if the results turn out to be cosmetic rather than practical? The Indonesian president provided a good summary by raising the issue: "The important question before us is whether we should allow the ongoing changes in the world today to proceed on their own momentum, unmanaged and uncontrolled, or whether, in all good will and sincerity, we should join forces – both among ourselves in the south and with the north – in directing these changes, rationally and equitably, towards a new order more capable of ensuring stability, social justice and equitably shared prosperity."²¹

An ambience of trepidation in these formulations imparts to the implicit battle lines a low visibility. Once they become explicit, sooner rather than later, they will demand attention to the logic of economic and social rights in their bearing on 'poverty', 'hunger', 'social justice' and 'equitably shared prosperity'.

The whole thrust of historical development behind the gratifying gains of 'soft law', discussed above, indicates that the affluent (but social liberal) west cannot ignore this logic. Some evasions, distractions and delays are possible, on account of the following factors.

(1) The consciousness of being the only superpower in the world, and the temptation to make hay while the sun shines, may make the US insensitive to the heritage of New Deal vision. As a part of its celebratory excesses, it may read more virtues in free enterprise than are warranted by historical experience.

(2) Not being novices in the imperialist games of helping themselves to larger mouthfuls, several western countries might exploit further rather than correct unequal exchange mechanisms, and thereby inflict greater misery on poorer countries. Protecting a few hundred jobs in their countries is considered far more important than creating/protecting a few million jobs in the latter. Their approach to recession, balance of trade, investment and technology transfer would be of a piece with this.

(3) To make a more exploitative, and regressive, package less unpalatable, the affluent countries might resort to projects highly publicised but cosmetically funded. They may also rope in strategically-placed elements in the poorer countries to achieve their economic and political objectives, on the assumption that conditioning to an 'unequitably shared prosperity' in the national context might make that in the international context a shade more tolerable. There is no fear, at least for the time being, of socialist radicalism on the prowl.

Factors such as these provide insights into some dimensions of the politics of human rights: suppressing an integrated view of human rights embracing economic and social rights, and suggesting a partial, and, therefore, false view of human rights through an undue emphasis on civil and political rights. The technical mask of economics can be pressed into service to lend plausibility to the whole exercise. To see through it, it is worthwhile stressing some well known positions: "The crucial point is that economics is about power".⁴² Much if not most of debilitating poverty today is a political, not a natural, product...⁴³ "The key variable in the mix of factors affecting human rights is the 'political space' in which decisions are made..."⁴⁴ States are not neutral instruments of technocratic economic management but rather the instruments, direct or indirect, of class or elite rule.⁴⁵

For some decades from the 30s, social liberalism incorporated a kind of optimal interface between political and economic considerations, between distributional equity and productive efficiency. With that balance upset, the crisis of economic theory and policy is awaiting a technical synthesis of the order achieved by Keynes. In the prevailing confusion, the free enterprise right is exercising its skills to give itself the benefit of doubt to jettison distributional equity.

What this has meant to the vulnerable, practically the world over, must be a source of anxiety for all. In China, we have a major example of a country trying to strike a better balance between economic and social rights on the one hand, and free-market reforms on the other. The former communist countries in eastern Europe must be rueing their improvident hurry. The predicament of the third world has been brought out by the G-15 summit recently.

In these circumstances, the advice of the affluent countries (enjoying the vital cushion of social liberalism) to the two worlds to wait for the miracles of the new economic dispensation will hardly command credibility. Nearly four decades ago (1956), C A R Crosland in his book, *The Future of Socialism*, criticised the ruthless hurry on the part of communists/socialists dissatisfied with the slower ways of the welfare state, and preferred the less prosperous welfare state with civil and political rights on the ground that "we do not want to enter the age of abundance only to find that we have lost the values which might teach us how to enjoy it". A similar stance *vis-a-vis* economism is needed now. Along with civil and political rights, economic and social rights sum up the values of a civilisation whose technological and organisational capabilities can create enough wealth to sustain a juster social order. It is time we defend the welfare state everywhere against the allurements of a free market-led abundance which is not worth having, even if we give the benefit of doubt to an exploded fallacy seeking restoration in a new garb. Protestations of love for civil and political rights, without economic and social rights, sound as hollow as protestations of love for economic and social rights, without civil and political rights, did in the 50s.

To say this is not to deny the contextual appeal, relevance and efficacy of free enterprise. The communist model of vanguard dominated and bureaucratically operated centralised planning having been discredited, there is no effective alternative. But some aspects of the structural adjustment programme, forced on the third world to the detriment of economic and social rights, with economic sanctions where sufficient and use of political clout reminiscent of the odour of gunboat diplomacy of an earlier era where necessary, entail sacrifices and suffering for those least able to bear them. Frequent recourse to the 'sanction' of human rights, in the untenably narrow sense of civil and political ones, accentuates the irony of the situation. On the other hand, the range of structural adjustments, in the range left by the imperatives of free enterprise, should have been the other way round, i.e. supportive of economic and social rights mandated by international consensus and law. There are straws in the wind to indicate that such a distortion is having an adverse impact on the economies of the LDCs (least developed

countries). The latest report of the UNCTAD states that "while the overall picture remains bleak, there are nonetheless some welcome signs of progress – even if halting – in approximately one quarter of the LDCs". A key issue, the report adds, was "the apparent inability of many countries to improve – and in some cases even to sustain – the provision of essential services, particularly health care and education". And here is an interesting conclusion: "Arresting this persistent deterioration in the human condition is seen as a key to economic recovery and sustained growth."⁴⁶

Apart from a sounder human rights picture, this 'key' suggests that the expected spin-offs, in terms of economic recovery and sustained growth, from economic and social rights could be better than the suspected ones from only civil and political rights. So, the third world would do well to make common cause with many, many adherents of social liberalism, instead of subordinating its interests to the greater glory and prosperity of the power elite in affluent countries, or, nearer home (in individual countries), to the greater glory and prosperity of feudal-fundamentalist-bureaucratic-conservative (liberal) elements.

The situation calls for political initiatives geared to strengthening the consensus and 'soft' law in favour of economic and social rights, and articulating political-cum-administrative instrumentalities in furtherance thereof. They might take the following forms:

(1) Organising a global response to the calls of the type issued by the foreign ministers of 12 EEC countries in July 1986 (fn 33), and issuing an updated version of the declaration, prioritising items such as education and health, and elimination of primary poverty through employment assurance/insurance measures. Universal education (up to high school graduation level) should be welcomed by the advanced countries as knowledge has been considered the 'central capital' and the 'crucial resource of the economy'; it will not only contribute to higher economic efficiency but also to raising the levels of health awareness, culture, and receptivity to media inputs on population control and environment. Those in the west, who are now worried about the competitive edge of the third world because of cheap labour, should be happy at the blunting of this edge on account of universalisation of education. It will also enormously simplify the issue of 'right to information' in the context of the advancing information revolution.

(2) The declaration should concentrate on priorities and not trivialities. There are several items, such as 'holidays with pay',⁴⁷ whose exclusion would not make a vital difference to the substance of economic and social rights.

(3) This should be followed by confirmatory/adaptive declarations by existing or new regional formations.

(4) Finally, the constitutions of individual countries should operationalise them in

relation to their quantitative and qualitative requirements.

Such declaration and provisions would remain platitudes unless they are backed by financial and organisational support. The following points might be examined for working out an action programme.

(1) Establishment of an international universal education fund to aid third world countries in accordance with the criteria of educational backwardness, with the most backward countries getting a higher share of funds. The fund may comprise contributions of all countries, with the affluent countries contributing one per cent of their military budget, and the less developed countries contributing less according to a graded scale.

(2) The existing World Health Organisation should be enabled to aid public health programmes in developing countries. Its scope and reach should be expanded to include extensive preventive and public hygiene programmes, particularly to strengthen the needed infrastructure.

(3) A human right implies entitlement to the world's resources to satisfy, to start with, the most basic want of hunger. Normatively, suffering on this account anywhere in the world should be the concern of the world community everywhere. At present, perverse practices like dumping huge quantities of foodgrains in the sea are resorted to as 'price stabilisation' measures. To obviate them, a world food security system should be evolved so that surplus stocks are scientifically preserved for use in emergencies in any part of the world at short notice. To placate the god of the market, surpluses may be purchased at rates conducive to price stability. Financial implications may not be formidable when we consider the fact that in the affluent countries multi-billion (dollar) industries cater to the nutritional needs of dogs and cats. The inconvenient moral dilemma has been resolved in favour of these more fortunate animals, as otherwise the poor facing the threat of starvation will lose the motivation to work for themselves, and possibly, for the greater good of the market and its more resourceful beneficiaries. It is time the exponents of human rights assert the parity of human beings with dogs and cats, and demand, without hurting the interests of the latter, investments in the proposed (or existing) food security system comparable to those in the industries mentioned above.

(4) The current emphasis on environmental problems, and on environment-friendly agriculture, is shared worldwide. There appear to be some subtle attempts to compel the already poor third world countries to invest in environmental protection measures so that the affluent countries do not suffer in terms of competition on account of such investment in their countries. These ironies may not be lost upon the developing world, used to the burden of 'reverse flow' of resources for many years. To prevent such

factors from getting compounded, it would be advisable to gather the organisational and financial threads of the 'environment' movement together, and to set up a world environment and employment fund. It is well known that massive afforestation, dryland agriculture, land and water management programmes, etc. to save the earth, have a high employment potential. As the future is more important, one need not harp on the resource guzzling record of an industrial civilisation whose main beneficiaries, aided by imperialism, have been the affluent countries. But mankind as a whole gains by correcting the consequences of past excesses and working for a better future. The technological and organisational capabilities available to mankind, coupled with the potential of 'informationalised' money, are yet to be tapped for making the vital right to employment a reality.

This is a fair modest programme of social liberalism in its bearing on mankind, and not just the affluent countries which can afford it. To make rights dependent upon the size of a country's purse is to drain them of their political content and spiritual flavour. Conservatives can, as always, be expected to put spokes in the wheel of progress in the name of the individual's duty to help himself, but with the hidden political agenda of preserving a power structure posited on imposing greater sacrifices on the poorer segments. Development, they would say, is not a zero-sum game; such sacrifices would not be necessary once the angel of free enterprise showers the manna of abundance. The position taken here implies a reversal of this short-term burden. To say this is not to remove free enterprise from its present high economic pedestal, and put back in its place the failed socialist icon of centralised planning managed by an unresponsive, 'self-serving bureaucracy'. The position with regard to development being a non-zero-sum game remains. Beyond this it can also be argued that to further strengthen the already strong countries, albeit for a short period, is to reinforce the cumulative factors which widen the gap and make corrective interventions at a later stage even more difficult/ineffective. Can anybody with a concern for human rights, even in their cribbed civil and political version, contemplate the massive human suffering in the third world with a sense of equanimity, unless he subscribes to fascism or the theology of suffering for the poor? One need not be a fire-spitting communist revolutionary of yesterday to appreciate the soundness of Ronald Dworkin's formulation that the most fundamental of rights "is a distinct concept of the right of equality, what I call the right to equal concern and respect". Paraphrasing it, Richard Harries says: "In Dworkin's view the concept of equality leads to the legitimacy of positive discrimination in

favour of the deprived." Its congruence with the theology of rights has an inspiringly compelling ring about it: "Bible is a book about positive discrimination. Its theme song is an imperative to discriminate in favour of the marginalised; and triumph song is an affirmation of god's vindication of the powerless. It is the right of those whom Franz Fanon called 'the wretched of the earth' - to life, to the basic necessities of life, to the human dignity we all share - that is the most pressing of human rights problems in theological perspective today."⁴⁴

With the battle lines drawn along this ideological divide, should the conservatives take a short-term view of their interests, the case for political struggles, matching in terms of strategy and mobilisation the challenge posed by the adversary, can no longer be in doubt. Explaining the third world interpretation by Ali Mazrui of the fundamental principles of the UN Charter "as a proclamation of global liberation in which human rights rather than state sovereignty held the first place," R J Vincent observed: "This is to place 1945 in the tradition of 1776 or 1789. The significance of such a location is that it legitimises revolution. If human rights do stand in this tradition, then they are not to be interpreted as the anodyne compromises of committee rooms at the UN, but as a call to arms."⁴⁵

When it comes to political struggles *vis-a-vis* economic and social rights, right up to a call to arms, why pray, exclude inquisitive glances towards democratic socialism, Marxism and the Russian Revolution? Are the latter's contributions to legitimisation of revolution, in pursuit of chosen emancipatory goals, too unimportant to be wiped out of historical memory? Apart from the Soviet Union and China, socialism as a fighting creed has had immense influence on the course of socio-economic development in the second and third worlds. A better way of understanding and benefiting by its now abundantly known failures, is to recall E Halevy's perceptive observation in a book published in 1938: "Modern socialism is a doctrine with a double aspect... It is a doctrine of emancipation... and it is a doctrine of organisation..."⁴⁶ Its failures, in the Soviet Union and elsewhere, relate mostly to the doctrine of organisation: the 'vanguard' thesis, centralised planning, 'democratic' centralism, and the dominance of (party) bureaucracy. As a doctrine of emancipation, its failure lies in its relative neglect of civil and political rights and its unnuanced approach to the case of integration of the two sets of rights. After making due allowance for such failures, we can still say that its massive contribution to the task of putting economic freedom on the agenda of history, and to that of actualising it substantially in countries where its writ prevailed, underline its continuing relevance as a doctrine of emancipation. This aspect is sustained by a formidable edifice of social

science – from the theory of ideology to that of the power structure mediated by the dynamics of class relations profoundly conditioned by technological factors. In the third world, where emancipation in this sense is still a major unfinished task, the failure of free enterprise to deliver the goods would inevitably bring the emancipatory thrust of socialism into sharper relief. If capitalism relapses into the pre-social liberal ways of baring its predatory claws, and, consequently, the battle lines are more sharply drawn, the socialist ammunition can make a crucial difference to the outcome. As a fighting creed, socialism will not disappear from the stage of history as long as the case for propelling the cause of economic and social rights remains strong.

As a peace-time companion of economic and social rights, too, socialism retains its relevance and utility – for humanising free enterprise. While paying handsome tributes to the market – “an excellent way of processing information”, conducive to ‘innovation’ and ‘decentralisation’ and dispersal of economic power – the exponents of market socialism seek to correct its adverse spin-offs for the disadvantaged as “a chosen and arranged device”.³¹ Liberals with a positive agenda must have derived considerable assistance from socialist inspiration in asserting, “a necessary background condition of a stable market order is a wide diffusion of wealth and a reasonable measure of equality of opportunity”.³² This should be the decisive test of the soundness and serviceability of the market, and not an inequitable abundance. Above all, the universal appeal of socialism – cutting across ‘races, nations, religions and civilisations’ – unrivalled by any ideology known to mankind, is a factor to be reckoned with in mobilising international support for human rights. In describing the broad socialist tradition as the “most powerful reform movement that history has ever known,” Ludwig Von Mises, a scholar from the other side of the barricade, has summed up the inner dynamic of this appeal with admirable brevity.

In the interest of human rights, a reformed capitalism and a reformed socialism should hold fast to each other. Their traditional foe is economism, which might deflect them from their joint mission through a resurrected version of the conventional wisdom of the old American doctrine of free enterprise. A partial view of human rights may be paraded and enforced (where possible), to divert attention from the advice of Alfred Marshall that the economist, like everyone else, must concern himself with the ultimate aims of man. Nothing expresses these aims for our civilisation better than an integrated view of human rights. Rights, it must be emphasised, belong to a different realm of discourse than the ‘charity principle’ or ‘stewardship principle’ figuring in the management literature of the social responsibility of business. They mean a profound political

response, not only from the national community but also from the world, to the deep pathos of the following fact: “To the landless worker in an Indian village, one of the world’s most unfortunate individuals, unemployment is not even a misfortune. It is his normal fortune”.³⁴ Galbraith, the author, would have been more deeply disturbed had he been conversant with another dimension of ‘his normal fortune’ – a centuries – old tradition of outrages on human dignity characteristic of the Hindu caste system. (In terms of social hierarchy, most of the landless workers belong to the bottom quartile.) The pathos of his ‘normal fortune’ is more than a parable of the poor state of integration between the two sets of human rights in the third world. It symbolises the predicament of our civilisation, committed to human rights but hesitating to take the next obvious step because of the problems of an ideologically split personality.

Socio-Economic and Demographic Differentials between Hindus and Muslims in India

Abusaleh Shariff

This paper reviews the socio-economic and demographic data according to religion available from various censuses, National Sample Survey and academic publications since the independence of India. Indicators such as, the structure and levels of employment, of living and of education according to religion are discussed. The fertility and mortality indicators, distribution and growth of population are also presented. The paper emphasises the need to strengthen the data based which would allow a study of ethnic and religious differentials in socio-economic and educational achievements.

I Introduction

INDIA is a multi-cultural, multi-ethnic and multi-lingual country. People belonging to many religions, such as Hinduism, Buddhism, Jainism, Sikhism, Islam and Christianity live in this country since time immemorial. However, there appears to be substantial differentials in the socio-economic and demographic profiles of major religious communities in India, mainly emerging from socio-cultural and historical reasons. This paper presents various types of social, economic and demographic data gathered from various censuses and National Sample Survey publications and discusses differentials according to religion. It is hoped that this analysis would provide a lead in understanding the contemporary Indian society in a better perspective. The main purpose here, however, is to generate interest among the readers to pursue further research on this issue, both at the micro-disaggregated and macro levels.

At the outset, it must be emphasised that various religious groups in India, especially Hindus, Muslims and Christians are not homogeneous populations. Each one is divided and subdivided into innumerable castes, sects and cultural groups. For example, the scheduled castes and the scheduled tribes, besides a large number of socially backward castes are a part of the Hindu community. Similarly, the Sunnis, Shias, Bohras and many other sects or cultural groups constitute the Muslims. It is my view that studying socio-economic differentials in India at the level of religious aggregation is simplistic and not advisable. However academic research has to reflect the socio-economic and cultural realities of its age. The contemporary politicisation of religion is such that a new focus which can be called as 'political economy and political demography of religions' is the need of the hour. It is in this context, even at the cost of being simplistic and seemingly un-academic perspective, that this paper is conceived and written. It is necessary that relevant facts and figures found in the official and academic records and publications are put together for an objective assessment of reality.

Section II of this paper presents the growth and distribution of population according to religion in India and in its major states. Section III discusses data on employment, occupation, levels of living and education according to various religions. The following section presents some fertility and mortality indicators according to religious affiliation and fifth section presents a discussion and some conclusions.

II Population Profile According to Religious Affiliation

Now let us take a look at the growth of population since independence. The Indian government as a routine exercise conducts complete enumeration of population every 10 years, which is known as decennial census. The last census was conducted in 1991 whose

TABLE 1. GROWTH AND DISTRIBUTION OF POPULATION BY MAJOR RELIGIONS IN INDIA, 1961-81
(Population in millions)

Census Years**	Total Population	Hindus (Includes SC's and ST's)	Muslims	Christians	Others
1951	361.1	303.6	35.4	8.3	9.7
1961	428.4 (21.5)	358.8 (20.3)	44.2 (25.6)	10.5 (27.4)	14.6
1971	533.5 (24.8)	442.8 (23.7)	57.8 (30.8)	13.8 (32.6)	19.0
1981	665.3 (24.7)	549.8 (24.2)	75.5 (30.6)	16.2 (17.4)	25.8

Notes: * Excludes the population of Jammu and Kashmir

** Excludes the population of Assam

Note: * Denotes less than one per cent of the state population

Source: Census of India 1981, Government of India

preliminary results are now becoming available. However, for many types of information the latest sources still are the 1981 Census publications. Census gives population figures by major religions for all India and states and union territories. The religious affiliation as reported by the head of the household during the census operations is presented in broad categories. For example, all Hindu castes including the scheduled castes and the scheduled tribes are identified as Hindus. Similarly, many Muslim sects and sub-sects have been clubbed as Muslims. The figures are presented in Table 1.

India got independence in 1947 which also led to partition of the country. A large number of Muslims moved over to the then Pakistan. In 1951 (the first census after independence) there were 35 million Muslims living in India, forming the largest minority. According to this census there were 304 million Hindus and about 8.3 million Christians in India. The Hindu population (including the scheduled castes and scheduled tribes) grew at the rate of 20.3, 24.7 and 24.2 per cent respectively, during the past three decades and in 1981 they were 550 millions or about 82.6 per cent of India's population. The Muslims population grew at the rate of about 25.6, 30.8 and 30.6 per cent during the same period and by 1981 there were 76 million Muslim living in India. The growth of Christians was 27.4, 32.6 and 17.4 during the corresponding periods. The decadal growth rate during 1971-81 was substantially lower than that of the previous decades, for the total population as a whole. This means the growth rates of its components, such as by various religions would also be lower compared with respective rates during 1961-71. A fact to note, however, is that while Hindus were the significant majority, Muslims constituted 11.4 per cent and Christians constituted about 2.4 per cent of the total population in India. Table 2 provides the distribution of population according to religious affiliation for 15 major states in India.

Excepting in Jammu and Kashmir and Punjab, the Hindu population is in majority in all the remaining 13 states considered. However, the Hindu population in Kerala and West Bengal was 58 and 77 per cent respectively which is less than the all-India average of 82.6 per cent. It can be seen that 64 per cent of population in Jammu and Kashmir are Muslims. This is the only state where Muslims are in the majority. The next largest proportion, about 21 per cent each, is found in West Bengal and Kerala. Muslims constitute about 16 per cent in Uttar Pradesh, 14 per cent in Bihar, 11 per cent in Karnataka and 9 per cent in Maharashtra. The states where Muslim population is about 5 per cent or less are Tamil Nadu, Orissa, Madhya Pradesh, Haryana and Punjab. Christians are mostly concentrated in Kerala, about 21 per cent, and in Tamil Nadu, about 6 per cent of the state population. The other areas where Christians are found in significant

percentages are some states in the north-eastern parts of India.

Overall, about 52 per cent of Muslims in India reside in three states, namely, Uttar Pradesh, Bihar and West Bengal. Another interesting feature of Muslims is that, with a few noteworthy exceptions, on the whole a larger proportion of Muslims live in urban areas, when compared with members of other religions (Table 3). For example, in all the south Indian states the percentage of Muslims living in urban areas is more than double that of the Hindu population, excepting in Kerala. It is likely that the proportion of Muslims in urban areas may have increased over the past four decades. The other states where the proportion of urban Muslims is substantially higher than the state average are Rajasthan, Gujarat and Uttar Pradesh. Conversely, in West Bengal, Bihar, Kerala and Jammu and Kashmir where a sizeable number of Muslims live, the proportion in urban areas is either lower than or about the same as the state average. At the all-India level, however, while only 22 per cent of the Hindus live in urban areas, about 29 per cent of Christians and 34 per cent of Muslims do so. Yet a point to be noted is that 66 per cent of Muslims and 71 per cent of Christians still live in Indian villages.

III

Socio-Economic Differentials Among Populations of Various Religions

Socio-economic conditions of a population can be assessed by studying indicators, such as, land ownership, occupation, worker population ratio, literacy and school continuation rates. Such data, for the first time, have been made available by the National Samples Survey Organisation (NSSO) through its 43rd round survey conducted during 1987-88. NSSO is probably the most scientific and dependable source of data on various types of social and economic information for both the states and national levels. These surveys are conducted on a sample of households round the year

and every year, often with a special focus. The 43rd round surveyed about 1.3 lakh households spread over about 8,400 sample villages and 4,600 urban sample blocks in the whole country. Publications emerging out of 43rd round survey contains some cross-tabulations by major religions, which are discussed in this paper. Although information can be made available separately for various states the published statistics are now available only at the level of all-India.

TABLE 4. DISTRIBUTION OF PERSONS BY HOUSEHOLD TYPE (OCCUPATION) AND RELIGION. RURAL INDIA, 1987-88

Occupation	(Per Cent)			
	Hindus	Muslims	Christians	Others
Agriculture	43.9	36.3	37.9	38.6
Non-agricultural	11.7	21.2	10.9	22.9
Agricultural labour	28.3	24.4	28.4	21.7
Other labour	8.3	9.9	10.9	4.6
Other occupation	7.9	8.1	11.9	12.3

Note: Distribution of population who are included under a certain category based on the household type of work/source of income of the household to which they belong. These percentages do not represent employment levels.

Jammu and Kashmir	21.0	21.8	20.4	66.8	1102	1081	1100
All India	23.7	21.9	34.0	29.2	1098	1134	1178

OCCUPATION AND WORK PARTICIPATION

Some rare data on occupation and work participation rates both for rural and urban is presented in Table 4. Accordingly, in rural India, about 44 per cent of Hindus (includes scheduled castes and scheduled tribes) undertake agricultural occupations as opposed to only 36 per cent of Muslims. However, 22 per cent of rural Muslims are engaged in non-agricultural and non-labour occupations as opposed to only 12 per cent Hindus. Nevertheless, over one-third of both religious populations work as agricultural/manual labourers in rural areas.

In urban areas, whereas 47 per cent of Hindus (includes the scheduled castes and scheduled tribes) are employed in regular wage/salaried occupations in organised sector (Table 5) only 29 per cent of Muslims are thus employed. Majority of Muslims are self-employed, for example, 53 per cent of them as opposed to 36 per cent of Hindus are self-employed in urban areas. However, 12-13 per cent of all the religious categories work as casual labourers in urban areas. Information on type of employment and sex specific work participation rates are difficult to find. This information in three broad categories of employment, namely, self-employed, regular workers and casual workers was made available in the NSS 43rd round publications. 'Self-employed', are those who earn their livelihood by working on their own traditional occupations and enterprises including own agriculture.

'Regular workers' are identified as those who work on long-term salaried jobs. All the modern public and private service sector jobs are included in this category. 'Casual workers' are those who work for wages on a day-to-day basis.

Table 6 presents structure of employment and 'work participation rates' (WPR) for various religious groups, by sex and residence (i.e. whether living in rural and urban areas). Note that the WPRs for males in both rural and urban areas for all religions are fairly high. The male WPR is marginally higher for all religious groups in rural areas. The differentials between religious groups for males is also marginal. The female WPRs are substantially lower in both rural and urban areas. Besides, the disparities in WPRs between religious groups are substantial. For example, the WPR among urban Muslim females is as low as 11 per cent while this rate is 16 per cent for Hindus and 24 per cent for Christians. Similarly the rural WPR for females is only 20 per cent for Muslims, while it is 34 per cent and 37 per cent for Hindus and Christians respectively. Apart from the lack of work opportunities for females, the cultural factors such as practice of purdha and female seclusion might have affected the female WPRs in India.

When we take a look at the distribution of employed persons by category of work it is interesting to note that over 53 and 60 per cent of male and female Muslims,

respectively, in urban areas and 59 and 68 per cent of males and females, respectively, in rural areas are 'self-employed'. This percentage is substantially lower for both Hindu and Christian males and females in urban areas. On the contrary Hindus and Christians' share in 'regular-workers' category is substantially higher for both males and females in urban areas. Muslims' employment in regular wage/salaried jobs is marginal. This presents a very dismal picture especially for Muslim females since their WPRs are very low to start with and of them only an insignificant proportion is in regularly paid jobs. One possible reason for this may be the lack of secular education among the Indian Muslim females (see Tables 10-13 and a discussion below). In the 'casual workers' category Muslims' share of employment is comparable to other religious categories.

OWNERSHIP OF LAND

Distribution of land ownership describes the intensity of resource base especially of a rural population dependent upon agriculture. Table 7 presents land ownership data for the all-India rural population. Excepting the 'other religions' category (which is a relatively smaller proportion of the total population) relative landlessness is more among Muslims. As opposed to only 28 per cent of Hindus 35 per cent Muslims are landless. Hindus also have a relative advantage in owning land in large size class. For example, while one-fifth of Hindus own five acres or more of land, only one-tenth of Muslims belong to this category.

RELATIVE LEVELS OF LIVING

The NSSO is known to provide data relating to the monthly per capita expenditures (MPCE) for both rural and urban populations of India. The MPCE is considered a better index of levels of living than the monthly per capita income GDP figures. Distribution of population according to MPCE presents a reasonable picture of the relative levels of living. Such information is given in Tables 8 and 9 for rural and urban

areas, respectively. There are substantial differences in levels of living between rural and urban areas and among the different

TABLE 7. DISTRIBUTION OF PERSONS BY SIZE CLASS OF CULTIVATED LAND AND RELIGION, RURAL INDIA, 1987-88

Area in Acres	Hindu	Muslim	Christians	Others

religions in urban India. The relative difference between the Hindus and Muslims is marginal in rural areas, but the difference is considerable in urban areas. For example, while 53 per cent of Muslims fall into the category of less than Rs 160 MPCE, this percentage is only 36 among Hindus. At the higher per capita expenditure classes the proportion of Hindus is considerably larger. It may be recalled that most of the Muslims in urban areas are self-employed as opposed to a majority of Hindus who are employed in the organised/salaried sector. It is likely that the levels of income generated by self-employment is substantially lower than the average income originating from the organised sector. The Christian population both in rural and urban areas has a relatively better distribution of the MPCE.

RELATIVE LEVELS OF EDUCATION

Levels of literacy and percentage of younger population continuing in educational institutions are considered good indicators of social development. Tables 10 and 11 present information on levels of education achieved by males and females according to religious categories. It is revealing that in rural areas Christians are by far the most educated. While illiteracy among Muslim men is 58 per cent, it is 51 per cent among Hindus and only 34 per cent among Christians. For females, respective percentages of illiteracy are 76, 75 and 43. Christians retain their lead even in higher education categories, for example, 9 per cent of Christian males and 8 per cent of females are secondary educated, whereas these figures for the Hindus (includes the SCs and STs) and the Muslims respectively are 5.7 and 1.7 per cent, and 3.4 and 0.8 per cent. Further, while non-negligible proportion of Muslim females and only 0.6 per cent of Muslim males are found in graduate and above category, these proportions are 0.2 and 1.2 per cent for Hindus, and 1.5 and 1.8 per cent for Christians.

Relative to rural areas, in urban areas the literate constitute a fair proportion among all the religious categories. The male illiterates in urban areas are only 19 per cent, 25 per cent and 42 per cent for Christians, Hindus and Muslims, respectively, and female illiterates are 23 per cent, 42 per cent and 59 per cent, respectively. Literacy rates at the level of secondary education in the same order are as follows: 20 per cent, 17 per cent and 8 per cent for males, and for females, 21 per cent, 11 per cent and only 4 per cent. Higher educated proportions are relatively better among Christian and Hindu males, 8 per cent each, but only 2.3 per cent of Muslim males are reported to be graduates and above. This achievement among females is 5.5 per cent among Christians, 4.2 per cent for Hindus and only 0.8 per cent for Muslims.

Tables 12 and 13 present data on continuing education by religious categories for rural and urban areas. Education continuation rates both in rural and urban areas are better

among Christian males as well as females. The enrolment and continuation rates are also better in urban than in rural areas for

all religious categories. However, at each level and in both rural and urban areas Muslim rates are substantially lower than Hindus.

Source: Various Census Documents.

For example, in age group 15-19 in urban areas, 56 per cent Hindu boys are continuing education as opposed to only 35 per cent among Muslims. These percentages are 42 and 19 for females. For age groups 20 years and over, the respective percentages are 323 and 12 for Hindus and 10 and 15 for Muslims. In rural areas the scenario is similar but at much lower levels for all religious categories.

Thus far we know that in terms of all the socio-economic parameters discussed above the Muslims are relatively worse-off than the majority Hindus which includes the SCs and STs and the Christian population in both rural and urban areas in India. In the following some evidences on the demographic aspects according to major religions in India are presented. Demographic transition theories have informed that the socio-economic factors influence the demographic parameters to a large extent. Accordingly socio-economic improvement of a group or a region would depress fertility, reduce mortality leading to an overall improvement in the quality of life.

IV

Demographic Differentials and Future Growth of Population

FERTILITY AND MORTALITY DIFFERENTIALS

A comparative picture of the household size for three religious populations according to place of residence is presented in Table 14. Overall the household size for Muslims both in rural and urban areas is higher than that of the Christians and Hindus for all states and for all India. A larger household size among the Muslims suggests, (a) a relatively higher practice of living in joint family situations, and (b) that actual family size per couple is also relatively high among Muslims. Various census publications contain data which present differentials in fertility and mortality of religion. Tables 15 and 16 contain this data for 14 major states in India.

General marital fertility rate (GMFR) presents the number of children born in a year per thousand married women in the age group 15-49. The total marital fertility rate (TMFR) presents the total number of children expected to be born to a married woman during her whole reproductive period starting at age 15 and ending at around 50 years. The child mortality rate (q₂) presents number of children who are born alive but dying before their second birthday per thousand live born children. Since the child mortality depend upon the socio-economic development of a group, it is considered a composite and summary index of development and standard of living.

The data presented on the above indices suggest that both in the urban and rural areas in almost all states, the GMFR and TMFR are consistently higher among the Muslims when compared with the Hindus and the Christians. Fertility among the Christians of

Kerala is the lowest. On the other hand the q₂ for rural Muslims in almost all states has been fairly lower than for Hindus and in many states lower than for Christians. In urban areas as well, with the noteworthy exceptions of Uttar Pradesh, Bihar and West Bengal, the q₂ for Muslims is lower than the Hindus. A combination of a positive growth of population and a low infant mortality rate (also low death rate) might have enabled a growth rate of population as a whole. Nevertheless, one wonders as to what could be the possible reasons for low child mortality among Muslims while the fertility rates are supposedly higher, and that they are also socio-economically worse-off. It may be possible to provide valid reasons for such a paradox through a three way classification and also through multivariate analytical methods. Such data are not yet made available by the censuses. However, some relevant data of this sort is published by the Operations Research Group, Baroda who have been undertaking National Family

Planning Surveys at intervals of about a decade since 1970

Distribution of the mean number of live births (MNLBs) and proportion surviving according to religion, education and income are presented in Table 17. These figures are the national average from a survey of about 45,000 households spread over all the states and union territories found in the mainland India. Mean number of live births for the country as a whole is 3.13. Overall the Hindus have about 1.3 per cent lower MNLBs than the Muslims. Women's education has a negative effect on fertility among all the religious categories. However, the fertility differential between the Hindus and Muslims still remain. A fact to be noted, however, is that while the fertility among the well educated (secondary level and over) Hindus was 31 per cent lesser than the illiterates, among the Muslims also this differential was as much over 27 per cent. Besides, with an increase in education of women, fertility differences between the Hindus and the Muslims decreases considerably. This suggests that educating women will depress fertility irrespective of religious affiliation.

1988	52	45	58
Percentage point change from 1980-88	+16	+20	+13

Source: Operations Research Group, 1990, p.106

Similarly an increase in levels of family income depress fertility albeit of lower magnitude among all the religious categories (Panel ii, Table 17). Nevertheless, the effect of education decreasing fertility levels both among Muslims and Hindus is substantially larger than the depressing effect on fertility of increase in levels of income.

The survival status of children is relatively better among the Muslims (Panel iii, Table 17), and this relative advantage is higher in lower income levels. An increase in the level of incomes will lead to improved survival among the Hindus. However, an apparent 4 per cent advantage in survival among the Muslims seems to be marginal.

USE OF MODERN CONTRACEPTIVES

The use of modern contraceptives is marginally lower among the Muslims when compared with the Hindus. However, the usership rates are substantial than what one is given to understand or generally talked about. For example, while the proportion of the Hindus is 85.2 per cent of sample population (Table 18), their percentage in contraceptive users is 86.1. Whereas, the Muslims constitute 10.6 per cent of the sample population, their share in the contraceptors is only 8 per cent. Further, the regular users of contraceptives are 50.3 of all eligible women among the Hindus and this percentage is 40.7 per cent for Muslims. Although the usership rates are relatively low, Muslims are not averse to acceptance of family planning as it is normally portrayed in the print media.

Panel (i) of Table 19 presents change in the family planning usership during 1970-88 according to religious categories. From a developmental point of view it is interesting to note that the family planning use which was only 14 per cent and 9 per cent for the Hindus and Muslims, respectively, during 1970 has increased to 46 per cent and 34 per cent, respectively, in 1988. The

percentage change during 1970-80 was 22 and 14 percentage points for the Hindus and the Muslims, respectively, but during 1980-88 this percentage change was 10 and 11 respectively, relatively more among the Muslims. Panel (ii) of Table 19 presents change in the inter-spousal communication of family planning among the religious groups. It is noteworthy that this change has been highest among the Muslims, recording a 20 percentage point higher than in 1980 which is more than an increase among the Hindus which is only 16 percentage points.

However, as far as Muslims are concerned, the trend in acceptance of family planning is encouraging, indeed the percentage change is relatively larger than the Hindus between 1980-88. This evidence allays a common allegation that Muslims are against the use of family planning. Indeed the evidence is to the contrary.

FUTURE GROWTH OF MUSLIM POPULATION

The available evidence suggests that in spite of declining fertility and mortality for the population as a whole and also for all its religious components, the relative fertility is higher and relative child mortality is lower among the Muslims compared to other religious populations in India. Does this mean that over a period of time the Muslim population would exceed the Hindu population in India? An answer to this can be found in simulation exercises undertaken in a research conducted at the Gokhale Institute of Politics and Economics, Pune [Mistry 1990]. Table 20 reproduces the results of this simulation exercise. It can be seen that if the base population of minority community is 10 per cent, and if the differential in the exponential growth rate is -0.004 (rate of growth of total population - r_1 minus rate of growth of minority population - r_2) then the percentage of minority population will be 12 per cent in 50 years duration, 14.2 per cent in 100 years, 16.8 per cent in 150 years.

TABLE 20. PERCENTAGE OF MINORITY GROUP (P_2) IN A TOTAL POPULATION (P_1) BY MEAN ANNUAL DIFFERENTIAL GROWTH RATE AND BY DURATION: A SIMULATION EXERCISE

Source: Mistry (1990).

19.8 in 200 years and so on. Note that these percentages are achieved only if the growth rate differential remains unchanged over a 200-year period. But normally the growth rate differentials do not remain static and the tendencies are towards a secular equalisation of growth rates among all the groups of human populations.

However, the present Hindu-Muslim fertility and population growth rate differentials are not large and are likely to narrow down in future [Mistry 1990]. Besides, any minority can become a majority only when three conditions are jointly met, that the minority constitutes a significant proportion of the total population, the population growth rate differential is large and the duration is substantially long. Since Muslims constitute only about 12 per cent of the total population and that the growth rate differential is about 0.005, at the national level it is not possible that the Muslims can outnumber the Hindus in India for a considerable period of time to come.

V

Conclusions

This paper reviews some socio-economic and demographic characteristics of population according to religious affiliation in India. The Hindus are the significant majority in all states excepting in Jammu and Kashmir and Punjab, where Muslims and Sikhs respectively outnumber them. Among the 14 major states, the Christians are found in substantial percentage only in Kerala. It is found that the growth of Muslims is higher than that of the other religious populations. Muslims are found to be dwelling relatively more in urban areas than the other sets of people. Muslims are mostly self-employed and their share in regular paid jobs is low. Hindu population is relatively better employed in regular employment in urban areas. The work participation of Muslim females is extremely low. The land holding is relatively better among the Hindus than the Muslims, and Muslims work on non-agricultural occupations in substantial proportions in rural parts of India. Muslims by far are least educated when compared with Hindu and Christian populations in India. The scenario is same if one studies the student population both in rural and urban areas as well. Muslim women are the least educated of all the possible categories discussed in this paper. Although the MPCE compares well between the Hindus and Muslims in rural areas, it is highly lopsided favouring Hindus in the urban areas. On the whole the Muslims are socio-economically worse off in all parts of the country.

The levels of fertility as measured by GMFR and TMFR are higher for Muslims in both rural and urban areas. But the child mortality among both the urban and rural Muslims is comparatively low. A combination of a positive growth of population

and a low child mortality seems to have enabled a marginally higher growth of Muslim population in India. More recently, however, there has been a noteworthy increase in the acceptance of family planning methods among the Muslims. In fact the percentage change in the family planning use is marginally higher than for the Hindus. The inter-personal communication regarding the family planning use has also increased substantially among the Muslims in India.

There, however, seems to be a paradox. Muslims in India are relatively poorer than the other populations, they have recorded relatively low levels of MPCEs, do not work as regular wage earners, are mostly illiterates, have relatively high fertility but contrary to the expectation they maintain a low child mortality. A question arises as to what could be the possible reasons for low child mortality among Muslims while the fertility rates are supposedly higher. Social scientists and demographers need to present a reasonable answer to this contradictory demographic phenomenon.

A simulation exercise reproduced in this paper suggests that the Muslim population will not overtake the Hindu population in India during a foreseeable future. The recent type of the communal and anti-secular minded opinion being expressed that Muslims soon will outnumber Hindus in

India does not stand the test of the scientific and academic enquiry. This paper, however, concludes by emphasising the need to strengthen the data base which would allow a study of ethnic and religious differentials in socio-economic and educational achievements. The Census of India can take a lead in this direction by publishing the cross tabulations of literacy by religion and distribution of workers by religion and industry at the level of India, states and various districts. Further, there is a need to undertake focused micro-studies to clearly understand the nature, type and magnitude of socio-economic problems faced by various communities in rural and urban India.

DISCUSSION

Candour about the Twice-Born

Sudhanshu Ranade

CANDOUR has a way of cropping up in the most unexpected places. In a Hindustan Lever ad, for instance, that I saw in the *EPW* a few years ago, the message was something like this, we do not sell products, we sell feelings (cosmetic feelings, the ad might have said, but didn't) like beauty, self-confidence, freshness, vigour, etc. More recently there was, once again in the *EPW*, an article by Paul Brass (September 9) in which, while making a case for increased access to sensitive areas for American academics, Brass referred to the "nearly two centuries long political drive by upper class elites to establish a 'national culture' for India based on their own values and interpretation of Indian history". The sub-title of the article, 'Virtue Unrewarded', nicely sums up one of its themes, and nothing further needs to be said in this matter, except that it would be interesting to know whether the sub-title was inserted by the editorial staff of the weekly, or Brass had himself put it there, 'up front'.

But the case for liberalised access was not based solely on virtue. Other things figured as well, like commerce, and the need to free academics from the 'Four Faces of Indian Bureaucracy'. Such a proliferation of

arguments is, of course, only to be expected. As John Lewis put it once, once you have decided, for some reason, to support a cause like, say, human rights in China, it makes sense to broad-base yourself by adducing all sorts of other reasons as well. The example is mine, Lewis's reference at that time was to poverty alleviation in the days when the World Bank, under the stewardship of former secretary of state McNamara, was espousing this cause of poverty alleviation 'directly' rather than 'indirectly' as at present.

But let us return to the point about 'upper class elites' attempting to establish 'a national culture in their own image'. The quote on this was, in the article, immediately preceded by a statement that those studying the glory of India's past were being allowed free access because their output 'feeds into' the hegemonic enterprise. A sound move, from the point of obtaining additional support from liberal circles in India for lifting restrictions on access. And, in an apparent attempt at leaving no stone unturned while reaching out to the already anguished hearts in this lobby, Brass immediately followed up the 'national culture' formulation with the warning that "time may yet be coming...

and perhaps has already arrived, when [even] scholars of Hindu religious and cultural texts" may be denied access because the results of their research might conflict with the "ideals and goals" (as defined by the said elites, of course) of Hindu nationalism. The possibility that those grim days may already have arrived suggested itself to Brass by way of encounters with the obstacles already being "encountered by our best scholars of Sikhism"

At first sight, it is a bit puzzling to have Sikhism brought in at this stage. Which Sikhism is Brass talking of here - Sikhism as interpreted by the brahmins in the US, or Sikhism as perceived by our own backyard brahmins? The question is important, for the latter version locates the Sikhs in the general tradition of mainstream Hinduism, while the former sees them as appearing to be so only on account of the forcible physical and ideological restraints to which they are subject. The article itself does not on the face of it provide an answer to this question. On the one hand, while lobbying for increased access, it cites the restraints on scholars studying the Sikhs as an example of the restrictions which are now coming into being 'for even those studying Hinduism'. But on the other hand, there can be no ambiguity about the fact that the basic paradigm is about the illicit nature of the nationalism defined by upper class elites. Sikhs are definitely not a part of the brahmanically defined nation, according to the paradigm; neither are a great many Hindus.

But this by itself need not leave us guessing. For, the impediments to the study of Sikhism are in fact impediments to the study of Sikh nationalism, the study of the centrifugal tendencies that have been driving the Sikhs. Nor is there any need to be puzzled about which people Brass had in mind when he spoke of "the best scholars of Sikhism": at the most laymen like myself might have a question about who Brass could have meant, apart from himself. But, bar that, there is no other ambiguity: this matter too is definitely settled.

But let us turn away from Brass and towards the question of the hegemony of upper caste Indian elites. This is a subject that has been long and much discussed, and it is therefore hard to say what exactly Brass means when he refers to it. But, taking a pot-shot, I would guess that Brass's position in this matter, like the position of many other liberal academics in the US, corresponds closely to the views spelt out by Paul Embree in a paper that he wrote 10 years ago, as the BJP juggernaut began moving menacingly towards both Ram and Rajya. The paper was reproduced as the first chapter of a collection of Embree's articles that was published in 1989, by when it seemed that the Lotus had definitely begun to blossom. The book, it is worth noting, was titled *Imagining India*.

A word about Embree's credentials. He taught at the Indore Christian College from 1948 to 1958. Judging from his frequent references to the pivotal role of Maharashtrian

brahmins in imaging India, Embree must have been in fairly close contact with the right reactionaries of Indore. Later, from 1978 to 1988, he was the cultural counsellor to the American embassy at Delhi. He has been president of the American Institute of Indian Studies, the nodal academic body for the funding of India related research in the US, and for many years has held various appointments in Columbia University's department of history. According to the editor of the 1989 book, "Embree's encounter with India has involved a sustained exposure to the real India, not just the India of books". The editor tells us also that Paul Embree has "trained scores of teachers, diplomats, and other specialists in Indian studies"; but we are left to imagine the ratio of doers and readers in this group of trainees. Embree's prose is powerful, and its elegance, I would guess, more than suffices to conceal its many infirmities from most passers-by. All in all, the man seems quite a bit like he and other Americans imagine brahmins to be.

Embree's argument starts from the objective reality that India was never even a geographical or cultural entity and, though some sort of political entity did at times exist, this was only for very brief periods and covered only a small portion of the subcontinent. The latter statement is, of course, fair enough, as a statement of fact, but one cannot help feeling that geography having been encompassed by the reference to the polity, it could only have been brought in a second time, on its own, for purposes of dramatic effect. Embree's treatment of culture was somewhat more sophisticated. It had to be, for though he conceded the unificatory role of culture, he went on to stress the diversities within that culture. India was for him a nation only because its constituent nationalities had failed to evolve into nation states. The rise of European nationalism was greatly facilitated by the fact that the "kings were able to get their territorial claims legitimised by the sacred authority". But this factor did not operate in India "Above all, while the brahmanical ideology certainly had rituals for legitimising kings, it does not appear to have stressed the importance of a defined territory in which the ruler had sovereignty." Despite this, the country was not really a nation: it was in fact many nations, never mind that nation states had failed to emerge, on account of the thoughtlessness or thoughtfulness of the brahmins, as the case may be.

In this connection Embree pointed out that the decision of the constitution makers of present-day India "annoyed the Pakistanis, who saw it as a pre-emptive claim by the Indians to the whole historic part of the subcontinent, both (to) the movements and events associated with the Islamic peoples in the area now controlled by India as well as the pre-historic Indian civilisation which had been situated in what is now Pakistan. Bharat, the ancient name from the Sanskrit texts, the Pakistanis argued, would have

been more suitable, and more honest, for a Hindu nation". The interesting thing, particularly, is Embree's use of the word 'pre-emptive'. For he could hardly have been suggesting that the Pakistanis wanted to call *their* country India.

It must, however, be conceded that whether or not India was right to call itself India, and whether or not it was entitled, merely on the basis of ancient traditions and folklore, to claim for itself the political boundaries established for the first time in history only in the latter half of the 19th century, and that too by the British, whatever the view that one may take on these matters, Embree is on solid ground when he points out that there are many regional cultures or nations within India. This, however, does not get him very far, for the people of the major regions have always seen themselves as Indians. After all, that was where Embree started, and no amount of arguments can shake off something that he began by categorically admitting as a matter of fact.

Others too have bumped into this problem, which is rather more tangled than its apparent simplicity may suggest - the problem about identity. Gail Omvedt, for instance, in *Dalit Visions*, found herself torn between the prescription for action (the dalits are not Hindus - more precisely they are not brahmins. I would have said, had that not sounded so absurd - and ought therefore to tear off their fetters), and the problem that had the dalits not perceived themselves as *being* Hindus (or brahmins, as the case may be), there would have *been* no fetters to tear off. The problem, then, is one of how the downtrodden castes or classes or regions or women are to free themselves from the spell.

I do not know to what extent this is doable. After all, it is not as if an assault on brahmanism is now being proposed for the first time. Anti-brahmanism has been a potent force in many parts of the country and indeed seems to have done rather well. A large number of brahmins have successfully shrugged off the spell of conventional brahmanism, and are now to be found in the US where, going by what one hears, they have managed to do quite a good job of bringing the citizens of *that* country under their spell. Unfortunately, brahmanism (or Hinduism, if you prefer the old label) remains hale and hearty; it is only the brahmins that we have been able to shrug it off so far.

We must therefore redouble our efforts in this direction. Not a moment is to be lost. Let us emote harder, shout louder, and as Americans, and under their influence, Indians, would put it, try various 'mantras'. Then, no doubt, the thing will be doable. Unfortunately, there is, once again, one small problem. All through the centuries we have had a nation without a state. Must we now, at this age, live up to Embree's cheerful characterisation of us (with the specter of European unification in his mind) as now being a state without a nation?

National Accounts Statistics of India - 1

Macro-Aggregates

EPW Research Foundation

I

Introduction

AN attempt is made in these series of notes and statistics being published in instalments in this and the following weeks to present a fairly comprehensive set of statistical statements containing the Central Statistical Organisation's estimates of various national accounts aggregates for India for the entire 44-year period from 1950-51 to 1993-94 (with some available estimations even for 1994-95). These statements broadly cover the following data sets: the relationship between national income and other key macro aggregates; consolidated accounts of the nation encompassing expenditure on gross domestic product (GDP) as per the Keynesian macro-economic identities, appropriation of national disposable income, financing of gross accumulation, and some aspects of external transactions; sectoral distribution of GDP; private final consumption expenditure by objects; domestic saving by type of institutions and household financial saving by assets; capital formation by type of assets and by institutions and sectors; net capital stock as well as capital-output ratios by type of institutions and by industry of use; key input-output relationships in various economic activities; distribution of factor incomes, property incomes and imputed bank charges by kind of economic activity; the evolving role of the public sector as seen through the national accounts statistics (NAS); and time-series on state domestic products and their sectoral distribution.

The objective of these exercises is essentially to present basic time-series on national accounts aggregates, which depict the growth of the Indian economy, as also its structural changes, over the years. It accepts the official series and the underlying conceptual framework as given. The basis of this framework as adopted in India lies almost squarely within the UN System of National Accounts (SNA) [United Nations 1968] except for marginal deviations due to paucity of data and not due to any conceptual differences. Incidentally, the application of the UN-SNA has now become universal as most of the countries under the erstwhile centrally-planned economies that previously used the System of Balances of the National Economy (widely called as the Material

Product System or MPS) have moved over to the UN-SNA framework [SNA 1993, UN 1995, Ruggles 1990].

No doubt, serious conceptual differences and differences in perceptions cropped up as between the developed and developing countries in the context of the recent revision of SNA. Developing country representatives aired the view that although the 1968 version of the SNA had served well as a general purpose system, it failed to address sufficiently the special concerns and circumstances of developing countries in Africa, Latin America, Asia and South Pacific regions. In a series of regional seminars and meetings held to discuss the proposed revision to the 1968 SNA, it was emphasised that contemporary social and economic issues relevant to national accounting, and the analytical and policy concerns of countries at different stages of development, should be duly considered and catered to in the revision exercise, though all had agreed that there should be only one single system covering the needs of all the countries (*The Journal of Income and Wealth*, July 1989). The Indian national income experts' played an active role in the final version of the revision of the SNA which has now been put into effect as a joint product of the member organisations of the Inter-Secretariat Working Group on National Accounts, namely, the UN Statistical Office, Regional Commissions of the United Nations, the IMF, the World Bank, the OECD, and the Statistical Office of the European Communities (EUROSTAT). A major objective of the revision has also been to bring about harmonisation of the SNA with six other major specialised statistical systems, namely, balance of payments accounts, government finance statistics, money and banking statistics (all three constructed and released by the IMF), labour and employment statistics of the International Labour Organisation (ILO), international standard industrial classification (ISIC) of all economic activities by the United Nations Statistical Office, and agricultural statistics by the Food and Agricultural Organisation (FAO). The international agencies have already revised their guidelines and handbooks regarding the compilation of these sectoral statistics by the reporting country agencies. In July 1993 the Economic and Social Council of the United Nations in New York adopted a unanimous resolution

recommending the member countries to consider using the 1993 SNA and to promote the integration of various economic and related statistics.

The national income and product accounts, which are inspired by the innovations in macro-economic theory dating back to the 1930s, have been amongst the major contributions to economic knowledge over the past six decades [Eisner 1988]. The theoretical literature has thrown up fascinating debates on such macro concepts as income, output, saving, investment, consumption, inventory, capital, capital consumption and 'keeping capital intact', and capital stock, but these issues are beyond the scope of this study. Nor do we propose to dilate on the question of the extended national income and product accounts with the suggestions for imputations for government and household capital services (consumer durables, for example) non-market work, and leisure [Eisner 1988], or on the purchasing power parity question [EPWRF 1995].

Suffice it to say, despite manifold problems of definitions and measurements raised in economic theory, the success achieved by statistical practitioners, at times with some compromises on the purity of concepts and theories, in producing the actual measurements of various macro-aggregate variables have facilitated translation of the relevant theoretical constructs into various empirical solutions and interrelationships. While the genesis of these actual accounts dates back to their early formulation by William Petty and Gregory King in 17th century England, credit for significant refinement in them are due to the contributions, only four decades ago, by Simon Kuznets, considered the father of the modern national income accounting [Eisner 1988:1612].

II

Evolution of National Accounts in India

In India, prior to the development of a regular national accounting system which was initiated in the mid-1960s, the main focus was on computing the country's national income [CSO 1989]. In the latter respect, there was a long tradition of individual economists and scholars as also men of public affairs making earnest attempts to estimate India's national income, per capita

income and levels of living of the population engaged in different activities [Heston 1982; Mukherjee 1969]. The first systematic and scholarly work in this respect was that of V K R V Rao [Rao 1940; see also Clark 1951], which in fact constituted the basis for post-independence work on national income estimation in India. International experts of fame in the field, namely, Simon Kuznets, J R N Stone, and J B D Derksen, also reviewed India's national income estimates and offered suggestions in their initial evolution. The first official estimates of national income were produced by the National Income Committee which was appointed in 1949 under the chairmanship of P C Mahalanobis with D R Gadgil and V K R V Rao as members. The work was continued in the full-fledged National Income Division (now designated as National Accounts Division) of the Central Statistical Organisation (CSO).

The 1960s and early 1970s also saw the gradual emergence of a full-fledged national accounts framework which incorporated step-by-step the estimates of private consumption expenditure, saving, capital formation, factor incomes, detailed accounts of the public sector, and consolidated accounts of the nation, which is what finally transformed the CSO's relevant publication from being *Estimates of National Income* until 1967 and *Estimates of National Product* between 1967 and 1974, to one as *National Accounts Statistics* (NAS) in January 1975. The subsequent series with 1970-71 base published in 1978 and that with 1980-81 as base published in February 1988 have continued the tradition, with considerable conceptual and methodological improvements, the use of improved data base and expansion of the scope and coverage of statistical statements. [For a critical review, see Roy Choudhury 1988 and Gothoskar 1988.] Under both the series the estimates for the back years up to 1950-51 have been provided. Thus, we now have almost all constant price series in national accounts with the base 1980-81=100 from 1950-51 onwards.

III

Key Concepts of National Accounts

National accounts statistics (NAS) is an integrated system of statistical statements depicting values of final products originating in different industries and those of incomes generated and outlays expended in the personal and private as also public sectors, which are consolidated with sources and uses of finance or accumulation accounts and closed with accounts of external transactions and which can be expanded to cover a system of social accounting matrices (SAM) that help to elaborate on linkages between supplies and uses such as input-

output matrices and the distribution of income and expenditure amongst household groups. For the present, the Indian NAS does not present any SAM for want of regular income distribution data, except that benchmark input-output matrices are worked out for five-year plan purposes [CSO 1990].

The evolution of, and symbiotic relationship between, various national accounts aggregates are depicted in the accompanying Tables 1 to 3. The foundation for the creation of the national accounts edifice is in the estimation of **gross domestic product** (GDP). Domestic product is an unduplicated total of monetary values of products generated in various kinds of economic activities during a given period, that is, gross value of output minus intermediate inputs. It is a comprehensive concept in that it covers all goods and services produced by the residents, irrespective of whether they are marketed or not, that is, exchanged for money or bartered or produced for own use. Imputed values of own-use products and services such as rentals of owner-occupied buildings are included. In the recommended production boundary, certain other activities like services of housewives are excluded on the consideration, as SNA 1993 explains, of (a) such self-contained activity having limited repercussions on the rest of the economy, (b) there being no suitable market prices, and (c) imputing values for such own-account production being both difficult and not useful for analytic or policy purposes. Also excluded in the Indian NAS are illegal activities, black marketing and production of forbidden goods like opium except to the extent some of the illegal activities get covered at the production stage.

GDP is thus essentially a product concept but in common parlance it is also accepted as an income concept because it is equivalent to value added which is the summation of incomes of factors of production. Hence it is **GDP at factor cost**. In this regard, a more appropriate income concept is **gross national product** (GNP) which is GDP plus net factor income from abroad. The new 1993 SNA has in fact preferred to redefine it as gross national income (GNI) but recognising at the same time that GNP is embedded deeply in economic usage [SNA 1993:163].

Almost all definitions of income provided in economic theory have emphasised the importance of "the maintenance of capital intact" so that the productive capacity is not depleted [see the debate between Pigou, Hicks and Hayek in Parker and Harcourt 1969]. In order to cover the possible progressive wear and tear of fixed assets, provision for **consumption of fixed capital** (CFC) is a necessary condition of keeping the production process intact. For the first time, a systematic estimation of CFC based on the estimates of fixed capital stock in all

economic activities using perpetual inventory method (PIM) was undertaken in the Indian NAS along with the revised series with 1980-81=100. (PIM means the building up of annual series of net fixed capital stock based on a benchmark estimate of the stock, annual additions to the stock, and assumed life profile of assets.) Conceptually CFC is the same as the depreciation provision, but operationally the value of CFC is higher than depreciation because the former takes into account the current values of fixed assets whereas depreciation in business accounts is generally at historic costs; business accounts also by and large downplay the service lives of the assets, show a quicker pace of depletion, overestimate the rates of wear and tear and obsolescence, and provide for larger amounts of depreciation. GDP or GNP less CFC is **net domestic product** (NDP) or **net national product** (NNP), as the case may be. The concept of **national income** is truly denoted by NNP. As an income concept it includes net factor incomes received from rest of the world; more significantly, as the concept of value added, it excludes the reduction in the value of previously created fixed assets to the extent they are used up in the production process.

The underlying rationale behind the national product and income concepts enumerated above is to measure the values equal to factor incomes; hence they are all valued **at factor cost**. But, the basic identity of national accounting is that gross values added must be equal to the sum of final expenditures on consumption, gross capital formation and exports minus imports. But these expenditures are incurred at prices prevailing in the market, i.e. they include factor cost plus net indirect levies (indirect taxes minus subsidies). Hence GDP (GNP, NDP and NNP) **at market prices** is to be distinguished from the same macro aggregates valued **at factor cost**.

REAL INCOME AND OTHER MAGNITUDES

With inflation as a common feature in the modern economy, the increases in values of any product or income measure can be to that extent a money illusion. In order to determine the real worth of the purchasing power of income, any income (or product) measure has to be based on unchanged prices of commodities and services from a base period and thus arrive at the measure in *real* terms. There are norms for the choice of the base period such as that it be a normal year and that it should not be a remote year which fails to capture the structural changes occurring in the economy. In India's NAS, there have been, four base periods so far and the current 1980-81 series is long over due for revision.

It should be noted that unlike in a directly constructed price index number series like

the wholesale price index or the consumer price index, the various price indices in national accounts are *implicit* indices in that they are indirectly derived by using, for instance, values of GDP worked out at current prices and those worked out at base-level prices. GDP is measured sectorally at current and constant prices, with the estimates of value added arrived at separately for major commodities, sub-sectors and sectors at the prices prevailing in the year of estimation as well as those prevailing at the base year. The sum total of GDP so arrived at current prices divided by the sum total at base-level prices gives the composite price index called the GDP deflator. The national accounts data facilitate the derivation of price deflators for various components of GDP such as agriculture or manufacturing and for various macro aggregates such as private final consumption expenditure (PFCE) and gross domestic capital formation (GDCF).

With respect to deriving GDP generated in different sectors at constant prices, the only sector for which the appropriate double-deflation method is used is the agricultural sector wherein various items of output as well as inputs are estimated at the base-year prices; in all other cases including registered manufacturing, single-deflation method is adopted wherein only value added is deflated by a single price index [see the debate on this subject in *EPW*, Balakrishnan and Pushpangadan 1994].

IV

Institutional Categorisation

As per the SNA, the resident institutional units that make up the total economy are grouped into the following five mutually exclusive institutional sectors: (i) non-financial corporate sector; (ii) financial corporate sector; (iii) the general government; (iv) the non-profit institutions serving households; (v) the household sector [SNA 1993:87-88]. In the Indian NAS, a variant of this system has been adopted. With the dominance of public sector in economic activities, a broad institutional category called as such has been introduced which combines the general government (consisting of central, state and local government units) and non-financial and financial public corporations that are defined in the NAS as non-departmental enterprises. Non-financial and financial corporations privately owned constitute the private corporate sector, while the household sector is a residual category comprising, apart from individuals, all non-government, non-corporate enterprises like sole proprietorships and partnerships owned and/or controlled by individuals and non-profit institutions which render educational, health, cultural, recreational and other social and community services to households [CSO 1989:219].

The categorisation of public-private corporate and household sectors is designed essentially for capturing the nature of legal entities owning physical and financial assets and incurring liabilities. The economic activities of savings and capital formation are undertaken by these institutional units, with the household sector being the net saver and the public and private corporate sectors being net borrowers. In the income and outlay accounts, public as well as private corporations as legal entities do not appropriate disposable incomes for final consumption themselves. Their expenses are intermediate inputs in the production process and not final expenditures, and likewise, their own parts of incomes or GDP are only in the form of direct taxes paid to the government and retained earnings which are their savings (see columns 15, 22 and 23 in Table 2). By definition, therefore, business corporations do not possess incomes (other than the above two) or final expenditures. Even the general government earns income out of domestic product only in the form of "income from entrepreneurship and property". Therefore, after providing for CFC, the bulk of the net domestic product accrues to the **private sector** except for (i) government's entrepreneurial and property incomes and (ii) savings of non-departmental enterprises. At the same time, the private sector income gets augmented by (a) interest on public debt, (b) pension and current transfers from government administration, (c) net factor income from abroad, and (d) remittances and other current transfers from the rest of the world. The difference between the **private income** so arrived and **personal income** is only the sum of corporation taxes and savings of the private corporate sector. The **personal income** so arrived at is the income of the household sector including the income of the non-profit making bodies serving households, on which the sector pays direct taxes and other miscellaneous receipts of government; the balance constitutes **personal disposable income** which is distributed between private final consumption expenditure (PFCE) and household saving.

V

Classification by Key Economic Activities

A major sectoral classification contained in NAS is based on the SNA-recommended international standard industrial classification (ISIC) but the selection of industries and industrial categories (such as registered and unregistered manufacturing) is designed to take into account the structure of India's economy. Gross and net domestic product generated in key economic activities, gross capital formation and net capital stock by industry of use, and factor incomes by

industry of origin are presented with the help of the above classification in the Indian NAS. A similar classification is done in respect of the public sector.

The economic activities comprise both commodity-producing and service activities. Incidentally, in the literature on the system of material product (SMP) which used to be employed by the erstwhile centrally-planned economies, the services were divided into two parts - material (or productive) services and non-material (or non-productive) services. Essentially all personal and most public services were excluded from the concept of material production in the SMP, whereas in the SNA system no such distinction is made and all services are said to render production activities.

The SNA visualises the possibility of presenting an integrated analysis of economic activities within each institutional category indicated above, but this requires very sophisticated data flow and few countries even amongst the developed ones truly attempt them.

VI

Estimation Procedure for Product Accounts

The edifice of national accounts is, as said earlier, built around the measurement of GDP by economic activity, or by sectors as per the **international standard industrial classification (ISIC)**. A complex set of methods is employed by the CSO to measure GDP generated in each of the sectors. Broadly, it could be said that production and income approaches are adopted, depending upon the nature of data available; in certain cases like labour-intensive *kutch* construction, expenditure method is adopted. Sectors which have been amenable to the production approach are, agriculture and allied activities, forestry and logging, fishing, mining and quarrying, and registered manufacturing. In respect of the following sectors, income method or some variant of it is adopted: unregistered manufacturing, electricity, gas and water supply, transport, storage and communications, trade, hotels and restaurants, real estate, dwelling and other business services, public administration and defence and other services. In the case of *pucca* construction, valued added is derived based on a proportion of the value of material inputs measured by the commodity-flow approach with adjustment made for relative movements in the index of wages of construction workers and the composite index of prices of construction materials.

In a number of cases of unorganised sectors of non-agricultural economy like unregistered manufacturing, water supply, wholesale and retail trade, hotels and restaurants, transport by other means (other

than the railways), shipping and air, storage nos, business services, legal and other services, gross value added is estimated on the basis of the estimated workforce employed and value added per person derived from field surveys undertaken from time to time.

A major novelty in the estimation of value added in the services sector relates to the concept of imputed service charges in respect of the financial sector output. Banks and financial institutions receive interest on loans and advances which is much larger than the payments they make to their depositors. If they are treated as any other productive enterprise, they would thus have a negative value added (even after taking into account the actual service charges made to customers in the form of commission, brokerage, etc). To circumvent this difficulty, an imputed income equivalent to interest and dividend receipts of banking and financial enterprises net of interest paid to depositors is defined as income earned. In the user industries, these imputed service charges are treated as intermediate inputs. Thus, in the case of agriculture, manufacturing and other industries using banking services, the imputed service charges are treated as intermediate consumption and hence netted out from their output while deriving value added. In the case of households and government, such charges are treated as part of private and government final consumption expenditure.

As is obvious, the estimates of domestic product are partly based on direct current data and partly on bench-mark estimates projected on the basis of specific indicators for subsequent years. In many cases, the bench-mark estimates pertain to remote periods, and sometimes for only parts of the sub-sectors under estimation. Working out a weighted proportion of the estimates of domestic product, the CSO has claimed that in 1985-86, about 62.2 per cent of GDP was based on direct current data (wherein the data from the basic sources become available for the year for which the estimation pertains). With data provided by the crop cutting experiments on the output of agriculture, as much as 85.1 per cent of value added was based on such direct current data; in agricultural inputs, however, it was 50.6 per cent [CSO 1989-90]. In some of the unorganised sectors like trade, hotels, and real estate and business services, very low proportions of GDP such as zero to 24 per cent are based on direct data.

Incidentally, because of the independent nature of estimates for different macro-aggregates based on separate methods and separate sources of data, the consolidated accounts of the nation presented in the NAS do not balance. A description of the resultant discrepancies or errors and omissions is presented in a subsequent part of this series.

VII What the Data Tell?

Any detailed review of the data presented in these statistical series is not attempted here. A few observations, however, are in order. Vast annual fluctuations in GDP growth in real terms with an acceleration in the 1980s, an increase in the share of GDP produced in the public sector over the years, a steady decline in the share of agriculture and a rise in that of services, which have been widely known, are depicted in these tables. A few more observations which deserve to be highlighted are as follows. First, government final consumption expenditure as proportion of GDP steadily rose until the second half of the 1980s and has fallen since then, while the share of private final consumption expenditure has been steadily falling corresponding to a rise in gross capital formation (or saving) (until 1990-91 at any rate). Second, underlying the evolving openness of the economy as measured by the ratio of exports and imports of goods and services together, this share has touched 20 per cent in 1992-93 – a precursor to further rise in the post-liberalisation period [RBI 1995b]. Third, the incidence of indirect taxes (i.e., as ratio of GDP) touched the peak in 1989-90 but has been rapidly falling since then; so have subsidies. Fourth, interest on public debt as ratio of GDP has been rapidly increasing since the mid-1980s and has touched the peak of 4.8 per cent in 1993-94 as compared with 1.1 per cent in 1980-81. Fifth, with the standardisation of the methodology for estimating capital consumption based on an estimate of the stock of fixed capital in all sectors has stabilised the CFC to GDP ratio at a little over 10 per cent. Sixth, major structural changes have occurred in the industrywise composition of GDP: decline in the share of agriculture to as low as 28 per cent by 1993-94, the relative stagnation in the share of industry (mining, manufacturing and electricity) at around 22 per cent and a steady rise in the share of services from 29 per cent in 1950-51 to 41.5 per cent in 1993-94, stand out as significant phenomena. Finally, the differences in the sectoral GDP shares as between the 1980-81 price and the current price series bring out the fluctuating nature of inter-sectoral terms of trade. Agricultural sector, for instance, enjoyed relatively better terms of trade between the mid-1960s and mid-1970s but suffered adverse terms during the 1980s, which has been only partially corrected since the beginning of the 1990s. The manufacturing sector has generally experienced relatively adverse terms of trade as reflected in the fact that the proportion of GDP originating in the sector at current prices has always been lower than that of GDP at 1980-81 prices – a feature which has significant implication for the process of industrialisation.

Note

[Compilation of statistical tables for this has been undertaken by V P Prashant, Paramita Debnath and Bhagyashree Mandke.]

I Uma Datta Roy Choudhury, Jagdish Kumar, R P Karyal and S G Tiwari, all of the CSO at one time or the other, were involved in the deliberations.

A GOOD BUSINESS COLLABORATION IS LIKE A HANDSHAKE.
THERE IS NO UPPER HAND.

Today's business environment is one of global interaction and cross-border affiliations. Companies with a common purpose and direction, quick to join forces. And yet, what defines a perfect business collaboration?

At Colour-Chem, we believe it is a relationship of equals. Just as the one we share with our global associates - Hoechst AG, Germany.

As a result of this relationship, Colour-Chem has access to world-class technologies, a reach into international markets and radically different management styles.

Styles that emphasise a culture of the highest order. That stress on being concerned on the customer's behalf, for his time and money. And that inculcate professionalism within the organisation.

Today, Colour-Chem is a Company that is on the move. With an established presence in domestic and foreign markets, and new horizons to conquer.

We are confident that we will make it happen with our partner in progress - Hoechst AG. Because ours is a relationship of equals.

**IDBI ASSURANCE.
ANYWAY YOU
LOOK AT IT!**

**IDBI
FIXED DEPOSIT
13%**

**Every month.
Every quarter.
All at the beginning.
All at maturity.**

YOUR FOUR-WAY OPTION WITH IDBI'S FIXED DEPOSIT SCHEME*

TYPE	MINIMUM DEPOSIT	YIELD STRUCTURE
Monthly Income Option	Rs 18,000	Rs 195 every month on a 5 year deposit of Rs.18,000
Quarterly Income Option	Rs 10,000	Rs. 325 every quarter on a 5 year deposit of Rs 10,000
Lumpsum Discounted Interest	Rs.10,000	You will get Rs.4,572 immediately on a 5 year deposit of Rs 10,000
Cumulative Option	Rs 10,000	A Rs 10,000 deposit becomes Rs 18,958 in 5 years

* Interest upto Rs 13,000 on the above deposits is tax-exempt under Section 80L of the Income Tax Act, 1961

MINIMUM DEPOSIT: Rs.10,000

Beyond the minimum amount, you can deposit in multiples of Rs.1,000. The base interest rate for

a three year deposit is 12.5%. And a deposit period of five years and more fetches a base rate of 13%. What's more this deposit comes with the guarantee of India's

premier development bank IDBI. Reflected in the FAAA rating by CRISIL given to this product indicating the highest degree of safety. Naturally, an organisation that has total assets of over Rs 36,000 crores can take very good care of your investment. For more details contact your nearest IDBI office or any authorised IDBI agent.

**This opportunity is open to: * Resident Individuals
* Hindu Undivided Families * Partnership Firms *

A flavour so rare, it's shared amongst barely 1% of mankind.

The flavour of 100% Darjeeling tea. Nurtured by gentle rains, cool mountain winds and a rich porous soil

It's so rare So delicate So unique that you can't get it in any other tea on earth Or grow it in any other

place but Darjeeling That's just why, a select 1% of the world shares it with such warmth

Under 'Structural Adjustment'

What comes through clearly from the Indian experience with structural adjustment is the dominant role of the process of globalisation of finance. The very design of the package of structural adjustment bears the imprint of this process and the sequel to the introduction of the package shows that the real mobility witnessed is that of finance rather than of capital in-production. The question is, if globalisation of finance restricts the possibility of intervention within a 'national' space by undermining the concept of a 'control area', can there be any sort of an alternative to the current set of policies?

3001

Traditional Industry and the Market

The marketing of raw wool in Rajasthan is embedded in multiple exchange relations. Conventions, contractual interlinkages and asymmetry of information are the rules which dictate the process of price formation of raw wool.

M-143

Though the market for silk has expanded both at home and abroad, the conditions of production remain unchanged. Household organisation of production is the 'core', yet its independent operation is non-viable. The cost-effective internal organisation of the households is linked with the market by the putters-out. Despite generating considerable surplus, the system has kept the artisan's income depressed.

Orthodoxy on Islam

Much of the research on Muslims still assumes that orthodoxy represents true Islam and that liberal currents are secondary. More work is needed on 'heterodox' trends to discover schools of thought which have placed Indian Islam in its specific Indian environment.

LETTERS TO EDITOR

Against Imperialist Offensive

UNDER the present all-round imperialist offensive, the neo-colonial exploitation and plunder of our country by the imperialists has grown to unprecedented heights. The whole country is being thrown wide open for the domination and control of the giant MNCs and financial institutions of the imperialists. This had led to grave economic crisis and the rising burden on the people causing untold sufferings to all sections of people. Ruling Congress governments especially the Narasimha Rao government now, has been shamelessly following the dictates of imperialist powers and implementing 'new' economic policies to serve the interests of imperialism and their Indian compradors. They have ratified the GATT treaty and joined WTO ignoring countrywide protests. BJP and parties of NF-LF though pretending to oppose some aspects of these policies, are implementing the very same policies in the states where they are in power.

The interests of the people of the country demand that the present offensive of imperialist powers against the people of the country should be opposed and beaten back. The present situation requires that revolutionary patriotic and democratic forces launch continuous struggle on the following demands: (1) Quit WTO; (2) Kick out MNCs, IMF, WB; (3) Stop payment of interests and instalments of foreign debts - Write off imperialist debts, and (4) Scrap 'new' economic policies - privatisation, liberalisation, globalisation.

We congratulate the people who are at many places valiantly and successfully fighting against MNCs and in defence of their rights against the present assault. The struggle needs to be made through and countrywide. The initiative brooks no delay. We call upon all the revolutionary, patriotic and democratic forces agreeing with the above demands and committed to pursue a course of agitation to achieve them, to come together for a decisive and broad-based struggle to beat back present imperialist offensive against people of our country.

KANU SANYAL

Overzealous Censors

IT is shocking to learn that the latest book by Salman Rushdie, *Moor's Last Sigh*, has been banned by the Indian customs, for unspecified reasons. We wonder what it is that prompted the ban on the book, apart from the alleged critical portrayal of Bal Thackeray in the book. And if that is the reason for banning the book, one is forced to

suggest that the forces of terror and censorship seem to have triumphed once again over the constitutional right to freedom of expression. This also has other more disturbing portents.

The silence of the liberal elite over the issue is deafening. While a few artists and intellectuals have opposed the idea of banning the book, any book, the silence of a vast majority of those who were so vociferous in condemning the ban on *The Satanic Verses* reflects how far we have travelled in our accommodation of the intolerance of the so-called Hindu zealots. The silence of the political elite and other champions of democracy over the ban is a sad reflection on their lack of real, as against acclaimed, commitment to the right to freedom of expression whenever it is politically expedient to do so.

The hypocrisy of our leading columnists, who actually tried to justify why the book should be banned, before it was banned, had already indicated how shallow their commitment to freedom of expression is and how elitist their notion of that freedom. It is alright for them to have read the book, but apparently, for others it might be a tool of incitement! It is as if in the realm of *realpolitik*, our fundamental rights have almost no defenders among the entire political establishment, in and out of corridors of the power. One can only hope that the saner voices may, yet, protest against the ban on the book or we may as well declare that our democratic structures are too fragile to be of any use whenever they threaten the perceived interests of our ruling elite

Images of the Body

MEENAKSHI THAPAN's article (October 28) opens up an area of inquiry which presents immense possibilities, but also a highly contentious terrain. The fact that women's (negative) images of the bodies and sexuality is influenced, even contoured by their experience of violence is well brought out. It is intriguing to think about how these perceptions may have changed in the urbanising, modernist society. It is equally intriguing to ask what the devastating experience of political violence in strife torn regions combined with perhaps increasing domestic oppression would do to women's perception of sexuality. But it also prompts one to ask what exactly constitutes a positive healthy perception of sexuality or of the bodies would be.

Thapan argues that women 'collude with their oppressors and are helped maintaining and beautifying their bodies and in so doing perpetuate their oppression. This is where the problem lies. To show non-acceptance and the rejection of 'oppressive' cultural norms, do women have to reject the experience of looking beautiful? Unless we arrive at notions of our bodies and of sexuality derived from our experience as people in our own rights, it would be hard to reckon whether the current perceptions which incorporate what may be called 'narcissist tendencies' are negative or are in fact indicative of rebellion and defiance and are a means of re-emphasising one's dignity.

Justice Denied

"INDIAN culture has not yet touched such low depths that an innocent villager would lose all sense of age and caste and like a wolf pounce upon a woman and that too in the presence of a 70-year old." Taking this moralistic high ground the Jaipur district and sessions court has acquitted the four accused in the Bhanwari case. What is disturbing is not only the acquittal, but the manner in which the court arrived at the decision.

Bhanwari Devi, it may be recalled, was a 'sathin' under the Rajasthan Women's Development Programme (WDP). As a part of the programme, she worked to prevent child marriages, in the course of which work she was threatened and harassed. It was her effective intervention in preventing the marriage of the one-year old daughter of Ram Karan Gurjar, one of the accused, which led to her allegedly being gang-raped by five men in September 1992. Bhanwari's trials and tribulations did not stop there — she was virtually abandoned by the WDP, the state authorities refused to hand over the case to the CBI even though an independent inquiry had found that there had been numerous lapses in the investigations by the state police. When the CBI did come into the picture, the officers subjected Bhanwari to incessant harassment and made her record and re-record her statement nine times. Even after the charge-sheet had been finally filed, a year after the rape, no move was made to arrest the accused until five months later. Such is the hold of the upper castes that all through this Bhanwari has been ostracised by the village community. Constant pressure has been put on her to withdraw the case. In February this year 30-odd newly-elected panchayat members from the area sought to attack Bhanwari and her sathin supporters and called for a boycott of the WDP if the case was not withdrawn. The trial in the lower court began in October 1994 and saw frequent changes in the bench. Five different judges have heard the case. In cases of rape the victim is allowed to give her statements in court in-camera. Making a mockery of this requirement, intended to safeguard the dignity of the woman, Bhanwari had to narrate her story in front of 17 men, including the accused. Representatives of women's groups who attended the trial protested against this and have reported on the frivolous manner in which the court dealt with the case, allowing insinuations and baseless accusations to be recorded in the course of arguments.

The judgment shows scant regard for the many changes which were incorporated in the law subsequent to the agitation around the Mathura rape case 15 years ago. The systematic campaign by the women's movement has been directed at ensuring that the woman's testimony be given adequate weightage. This has been prompted by the social and political

understanding of rape as a means of aggressively asserting the superiority of sex, caste, race and class. Rape and sexual assault are actions used to punish, harass and quell rebellion of all sorts. Given this, the processes required to establish the crime in a court of law are often beyond the reach of the victim. Thus circumstantial evidence may often turn out to be too weak through no fault of the victim.

Ignoring the well known fact that the police had initially refused to record Bhanwari's statement, the court has made disparaging remarks about the delay in her recording the complaint. Bhanwari has stated that she was refused medical examination at the PHC on the ground that a female doctor was not present. Subsequently any number of obstacles were put in her way before she was examined at the government hospital after a delay of 52 hours. The court, taking a completely insensitive attitude to the problems which Bhanwari encountered, as in fact most women victims of sexual assaults do, has decided that the delay in recording the complaint and the medical examination showed that Bhanwari had concocted her complaint of rape. Even worse is the unembarrassedly casteist and sexist tone of the judgment. It has, for instance, expressed doubt about Bhanwari's complaint on the premise that upper caste men, including a brahmin, would not rape a woman of the lower caste. Clearly, not justice, but the bench has been blind — all through history rape of lower caste women has been a widely practised, brutal way of silencing and subjugating the deprived classes. That the gang rape of Bhanwari was meant as a warning to those who chose to interfere with the customs and practices of the upper castes, no matter how depraved, hardly needs to be stated. The court has by implication underlined and re-emphasised that warning.

Bhanwari's case is unique in some ways and opens up many issues for debate. She had been raped in front of her husband, though the court has sought to doubt that fact arguing, "in our society how can a husband, whose role is to protect, stand by and watch his wife being raped?" Bhanwari has also persisted in her protests and demands for redressal. Even with the changes in the law on rape, time and time again women victims are short-changed by the legal system — often because traditional, feudal forces in society militate against women's access to justice; sometimes simply because the system does not deem it necessary to make special provision for the depressed and the powerless to seek justice. At another level, it was Bhanwari's actions as a state functionary empowered with the task of preventing an obnoxious social custom which provoked the reprisal. To what extent then can social change be brought about from the top, in the absence of a movement supporting these changes? As Bhanwari's case has shown, a

state agency, however sensitive and woman friendly cannot take on the tasks of a people's movement; nor can it on its own facilitate social change. And when it does attempt to do so, the contradictions between the priorities of the patriarchal bourgeois state and the accommodation it has had to make to the demands of social movements will trap its hapless functionaries in impossible situations. Social changes which empower the powerless, whether they be lower castes, the economically and culturally poor or women, intrinsically endanger the very foundations of the state structure. There is an urgent need, in other words, to take back the women's agenda from the state and its agencies.

EXTERNAL CAPITAL

Looking for Palliatives

AS an answer to the acute shortage of domestic liquidity and the depreciation of the rupee, the authorities have removed all restrictions on the permitted use of proceeds of external commercial borrowing (ECB) and Euro-equity issues in the form of global depository receipts (GDRs). Initially, in early 1992, when Indian companies were permitted to access international capital markets through Euro-equity issues, the objective was to encourage the corporate sector to take recourse to non-debt creating capital inflows. The Gulf crisis and the downgrading of India's credit rating below investment grade and the net outflows on ECB account, as also the volatility inherent in short-term debt all made the government turn to such non-debt creating flows, and if ECB was to be resorted to, preference had to be given to long-term borrowing. When permission was granted for Euro-issues, including foreign currency convertible bonds (FCCBs), the government did not stipulate any restriction on the end-use of funds raised through them. However, permission was granted on a case-by-case basis and companies were asked to raise resources to meet their requirements (which, in the liberalised set-up, could be both foreign currency and rupee requirements) for new projects and modernisation and expansion, as also for repayment of expensive debt, about 15 per cent in addition for corporate restructuring and working capital margins. It was also stipulated that companies raising money abroad had to repatriate the entire proceeds unless specifically permitted by the government and further that Euro-issue proceeds had to be used for the approved purposes within a period of one year, though this was observed more in the breach.

By the end of March 1995, \$ 4.7 billion worth of Euro-issues (\$ 3.7 billion GDRs and \$ 1.1 billion of FCCBs) were raised and \$ 4.4 billion (over Rs 12,000 crore) were repatriated into the economy. Whatever the benefits the concerned companies gained from this capital raised abroad, it wreaked

havoc on the country's financial system. The companies did not deploy the funds for the intended projects, instead, they were invested in shares in the secondary market and in real estate (apart from being used to repay loans from financial institutions and cash credit from banks). These investments combined with portfolio investment by foreign financial institutions (FIIs) pushed up share prices such that the BSE sensx reached a peak of 4,643 on September 12, 1994. The subsequent withdrawal of portfolio investors from the emerging markets, including India, the precipitate fall in share prices and the difficulties faced by investors in unwinding their funds are well known.

It was then realised that apart from the severe impact of capital flows on monetary expansion, what was being done by the companies did not, and could not, add up to a prudent system of managing external liabilities. Therefore, with effect from October 18, 1994, revised guidelines were issued whereby companies issuing GDRs were required mandatorily to retain the issue proceeds abroad; the proceeds could be repatriated only as and when expenditure for the approved end uses (including 15 per cent for corporate restructuring and working capital margins) are incurred. This was to enable companies to tap markets abroad only for approved purposes, while monetary expansion as a consequence of the Euro-issues in advance of the need for funds would be avoided. In May this year a modification was effected to permit the issuing companies to retain the Euro-issue proceeds as foreign currency deposits with banks and public financial institutions in India, which could be converted into rupees only when expenditure for the end uses was incurred. Though it was induced by the situation of excess liquidity growth, it was a prudent measure as access to foreign capital, which was necessary to supplement domestic saving, was required to be need-based and for productive purposes.

The latest liberalisation of the guidelines regarding use of Euro-issue proceeds has reversed the above policy and taken an extremely short-term view of the liquidity constraints, both in the domestic foreign exchange market and the money market. GDR and ECB proceeds can now be freely brought in and converted into rupees immediately in anticipation of the use of funds in future for the approved purposes. The ceiling on the share earmarked for working capital and corporate restructuring has been raised from 15 per cent to 25 per cent. The revised guidelines also exempt companies investing in infrastructure projects including power, petroleum exploration and refining, telecommunications, ports, roads and airports from having to provide a three-year good track record to raise funds abroad. The Euro-issue scheme has been extended to include FCCBs. Earlier companies could raise funds through the

ECB route only by the medium of floating rate notes and fixed rate bonds. Now funds can be raised also through foreign currency convertible bonds. Likewise, the companies can convert any portion of their floating rate notes (FRNs) and ECBs into FCCBs.

What is overlooked is that the present liquidity crunch is deeply rooted in the fiscal imbalance and the large government borrowing to finance current expenditure; the severe shortage of domestic saving; and the high propensity to import that has been further raised after the liberalisation of imports. It is short-sighted to imagine that what is required is some palliative in the form of encouraging companies to obtain foreign equity and debt and that thereafter the basic problems will be automatically resolved.

It is unlikely that against the background of the severe macro-economic imbalance the GDR and ECB route will attract substantial foreign funds. Though Moody has placed India on investment grade, Standard and Poor continues to rate India as non-investment grade. For the grade to be improved, it has sought a reduction in public debt and, to achieve that, reduction in gross fiscal deficit, public sector reform, reduction in inflation and prevention of any significant deterioration in the balance of payment. Also, associated with the recent lukewarm attitude of portfolio investors from developed countries towards the emerging markets, Indian GDRs have been doing rather badly. Primary issues have been difficult as very few. In the secondary market, Skindia GDR index (base April 15, 1994 = 100) which had once touched a peak of 123.82 on August 18, 1994, is now ruling at 65.86. Likewise, the DSP GDR Index (April 1994 = 100) touched a low of 69.47 on November 13 and has recovered only fractionally to 71.79 since then. In the primary market, there have been some severe GDR issues, all of them privately placed. The companies involved such as Fle Industries, Himachal Futuristics and She Wallace have scarcely tried to conceal that these so-called private placements are a device to bring back funds stashed away abroad earlier.

More enduring and purposeful solution for the basic problems will involve restriction of imports and more rational export-import management. The question of domestic saving will also have to be addressed more thoughtfully in the form of curbing conspicuous consumption, including investment in gold and silver.

KARNATAKA

Settling Granite Dust

CURRENTLY a 20-member joint committee of the Karnataka assembly is undertaking an investigation into illegal quarrying of granite, especially in Kanakapura taluk near

Bangalore. Quite apart from the extensive racket in quarrying and exporting of granite, the probe highlights the short-sighted perspective which is currently determining policies related to natural resources and the environment.

Granite quarrying came under the purview of the state after the passing of the Mines and Minerals Regulation and Development Act 1957 which required the granting of leases or licences to mine granite. Until the 1980s granite was a building material used for local constructions. With the beginning of a boom in the building industry and the globalisation of the market, granite became a much sought-after material. With this came a flood of applications for licences and the state was forced to set limits. If ecological considerations had alone been paramount then quarrying of any kind would be tightly controlled, because it affects the physical features of a region and therefore the entire ecosystem, quite apart from the fact that the operation itself causes pollution. In fact, if an ecological perspective influenced all policy, then the state's policies on mining and quarrying would have been different. In Karnataka with granite becoming a high-priced exportable commodity, it was inevitable that there should develop a granite lobby which, through various means, has sought to influence the government's decisions. Each new ministry has sought to gain maximum political leverage by making changes in the requirements for issue of licences, in the limits on the number of leases granted, etc. It is hardly surprising that illegal quarrying of granite and its export has been extensive, although only last year, with a conscientious director of mines and geology asking uncomfortable questions, was the chief minister forced to acknowledge it.

There is no doubt that the joint legislative committee will disturb a lot of granite dust, but the moot question is will the government take note of all this for policy formulation? This is unlikely to happen. There is, neither in the states nor at the centre, any comprehension of the urgent need for a policy on natural resources, and market considerations are being allowed to reign supreme. Ironically, it is in the long-term interest of a developing and vibrant market that government policy needs to evolve with greater pragmatism and sophistication. Without this, short-term political considerations will determine the course of policy.

EXCHANGE RESERVES

How Much Is Enough?

WHATEVER else may be said about the exchange rate policy followed by our authorities, the recent turmoil, short though it has fortunately turned out to be, for the present at least, should make them consider

some questions far more seriously than they have given evidence of doing so far.

In its 1994-95 Annual Report, released in September, the RBI does discuss at some length the question of adequacy of external reserves. "The present level of external reserves is," the report observes, "a source of comfort as it provides a measure of insulation against unforeseen external shocks or shocks created by domestic supply shortages". While, as the same report puts it, external reserves may not be "required to meet the transaction motive which is to be taken care of by changes that will naturally occur in the market determined exchange rates", they have an important "smoothing" job to perform "in a period of transition when structural shifts can release strong excess demand or throw up temporary bottlenecks". The reserves can then "smoothen the process of change and mitigate the pains of adjustment".

There can be no two opinions that even when a country's currency is not pegged to any predetermined external value, it does need to maintain some external reserves. How much should they be is the question. Is it the RBI's position when it says "the present level of external reserves is a source of comfort" (the reserves added up to \$ 24.153 billion in June this year) that exchange reserves have to be of this magnitude? On the answer to this question will revolve the ability of the authorities to face up to situations like the one we faced recently, namely, of excess demand.

As import cover, external reserves have, as the RBI's Annual Report puts it, "soared from below three months as on July 12, 1991 to around 10 months at the end of 1994-95". As debt servicing cover also, the improvement in reserves is substantial, from eight months in 1990-91 to 27.2 months in 1994-95.

But as the RBI itself points out, in an exchange rate regime where the external value of the currency is to be determined by market fundamentals, the need for external reserves is less for transaction purposes and more to meet other type of exigencies. "As the economy becomes more open", says the RBI, "external shocks need a cushion which reserves alone can provide", and "the volatility of some of the capital flows needs to be kept in mind in this context".

Is the RBI suggesting that the cushion we now require in the form of external reserves has to be as large as provides a 10-month import cover, since it is at this level that the reserves are considered to be "a source of comfort" to the authorities? Logically, then, it would seriously constrain the ability of the authorities to intervene in the event of excess demand. After all, we cannot forget that in the recent episode the authorities did take time to intervene and it was because of this hesitation that the external value of the rupee threatened to decline much more sharply

than they probably wanted it to, given their assessment of the change in the so-called market fundamentals.

And accumulation of reserves, it has to be remembered, is not a costless operation. Every dollar set aside as reserve could as well have been used to build up the country's productive capacity. So the country cannot go on accumulating reserves, particularly when the opportunity cost of such an operation is high. A study now has to be made, and that too with transparency not shown so far, on what level of reserves it would be adequate to maintain. Then the authorities will enjoy a far greater measure of freedom to intervene without being tied down to maintaining unnecessarily high levels of reserves.

PAKISTAN

Military Politicians

THE recent arrest of 36 army officers in Pakistan on charges of plotting an Islamic revolution to overthrow Benazir Bhutto's government has important implications for the future of that government both in domestic politics and foreign relations.

Observers in India have primarily noted the timing of Benazir's decision to publicly disclose the news of the arrest and plot (after more than a month) just on the eve of her US visit, and have concluded that it was a ploy to impress the US with her determination to fight Islamic fundamentalist forces in her country and thus ensure arms supply under the Brown amendment. While this may indeed be true, one cannot at the same time dismiss the real possibility of another military putsch in Pakistan.

In the past, the country's polity had been plagued by numerous abortive, as well as successful, military coups. The failure of the civilian system of governance to deliver the goods, and its gradual abdication of responsibility paved the way for the rise of the military and the establishment of its rule in successive coups, supported by the feudal elite and orthodox religious forces. Frustration in military adventures often led the army officers in the past to blame the civilian system and the political leadership. The first conspiracy, abortive though, was discovered in 1951 and was primarily caused by army dissatisfaction over the outcome of the 1948 Kashmir war. The loss of East Pakistan in 1971 and the consequent sense of humiliation brought about another phase of military rule under General Zia.

Given this past history, today's Pakistan might become again a vassal state of military politicians. In domestic politics, Benazir Bhutto's government stands a helpless spectator as the country drifts into violence, corruption and deep economic crisis. In foreign affairs, she appears to be equally confused — not knowing how to solve the

Kashmir imbroglio on the one hand and beginning to get embroiled on the other in yet another futile adventure in Afghanistan (through the Islamabad-trained Taliban forces), at the risk of antagonising Iran, Pakistan's traditional ally. The popular mood of frustration with civilian rule might swing over to a desire for an authoritarian regime, expecting that the latter would impose discipline and be decisive. Major general Zahoor ul-Islam and the 35 army officers (including a brigadier and three colonels) who were arrested on September 26 could have planned their coup on the assumption that it would have the support of the people — or at least would not be opposed by them.

It is significant that Lt General Mehmood, director general of Pakistan military intelligence, in a confidential note to all lieutenant-generals, soon after the September 26 arrests, warned that there was a wave of sectarianism and extremism in Pakistan which, if not checked in time, could tear apart the whole fabric of Pakistan society. It is becoming evident now that Zia's policy of Islamisation had led to the infiltration of the Pakistan army by a new generation of Islamic zealots, and its increasing politicisation in the direction of Islamic fundamentalism. The leaders of the abortive coup, according to Pakistan military sources, planned to storm into a meeting of army officials on September 26, kill all the nine corps commanders and the four principal staff officers, and declare the onset of a 'true Islamic revolution'.

While Benazir's success in ensuring the flow of US arms may appease for some time the hawks in her army, it is yet to be seen how far she — and the more responsible among the army top brass — can restrain the younger generation of Islamic zealots (who are said to form a substantial chunk of the army, from the lieutenant colonels to the ranks down below) and whether Washington would encourage at this stage another military coup by them.

SRI LANKA

Narrow Options

THE tragic irony of the Sri Lankan situation is that both the LTTE and the government in Colombo are moving in circles which sadly are drawing further and further away from the central issue of the conflict. If 20 years ago the concept of a Tamil Eelam — a response to the patent ethnic bias in the operations of the administration — prompted the setting up of the LTTE, today those who are to benefit from this dream are the victims of a brutal war. The LTTE's decision in April to break off negotiations with the government and return to the battleground was at best a strategic mistake and at worst a self-serving move intended to ensure that the peace alternative offered to the war-weary Tamils of the north did not materialise. Reports from

Jaffna indicate that the LTTE has let loose a reign of terror, ordering citizens to vacate the town. The University Teachers for Human Rights (UTHR) to Jaffna has pointed out that the LTTE had "compounded civilian suffering for political and military gain without any acknowledgement of responsibility for the people". That the military campaign launched by the Sri Lankan government is a no-holds-barred effort to capture Jaffna can hardly be disputed. The UTHR has in its report pointed out that the government's figures of the number of those killed and injured in the army assault on the town are gross underestimates. Artillery shelling and aerial bombardment of civilian areas has been carried out on a large scale.

It is not that the Chandrika government is entirely sympathetic to the Tamil cause. The issues of territorial and therefore political freedom which form the core of the Tamil demands can never be acceptable to any rulers. But Chandrika's was a gambit which offered to the Tamils an opening which could bring the issue into the mainstream in the broader democratic and proposed federal framework at a juncture when it was clear that a military solution, if any at all, could only be extremely costly to the people. By repeatedly rejecting all moves made by the government the LTTE has allowed the hawks in the Sri Lankan government and the army to gain the upper hand. It has also left itself with few options other than to retreat from Jaffna into the jungles as it did once before and continue the struggle for Eelam at a decided disadvantage.

There is evidence to indicate that the LTTE is in a desperate situation. Its once considerable financial support appears to be drying up, going by the nature of the appeals in its journals and broadcasts. There has been a drastic drop in recruitment. Clearly, Prabhakaran's statement that the LTTE will continue to fight even if it lost Jaffna is a piece of bravado. The Sri Lanka government is, however, taking the threat seriously. Not only has the defence budget been hiked, it has also circulated a proposal for introducing conscription. While observers say that the proposal is unlikely to be pushed through, these moves indicate that the military presence in the northern and eastern regions will continue for some time.

This is the most tragic aspect of the situation. Parliament will soon be debating Chandrika's proposals for a new federal structure allowing greater autonomy for the regions. Even if all elements of the proposals are not accepted, Sri Lanka will see a new federal structure under which ethnic minorities will have greater autonomy and acquire greater decision-making powers. But given the present situation, with the LTTE fighting a guerrilla war, the region will be under virtual military control, with all the obstacles this presents to normalisation of life.

TWENTY YEARS AGO

(EPW, November 29, 1975)

THE decision to create a new genre of commercial banks, known as rural banks, is another example of how the problems of ameliorating poverty are seen as distinct from those of development. One set of institutions, instruments and policies are devised for development and then when it is found that the resultant economic growth benefits in the main only the rich, other programmes and schemes are thought of for improving the condition of the poor.

The setting up of rural banks to meet the credit requirements of small farmers, agricultural labourers, artisans, small entrepreneurs and other persons of small means in the rural areas follows the same pattern. The co-operative societies and commercial banks have by and large failed to help these sections of the rural population to any significant extent. Therefore a separate set of institutions has been considered necessary even as the co-operatives and the commercial banks carry on as before. But why not make the existing institutions change their attitudes and methods of operation, if they are coming in the way of the desired changes in the pattern of credit distribution? On the other hand, if the bigger farmers continue to hold sway over the development process in the rural areas, can the total resources earmarked for the poor be raised significantly merely through the creation of new institutions? In fact, once a separate institution is set up for the purpose, the existing ones would tend to wash their hands altogether of the responsibility of bothering about the poor. Why not instead, ask the existing institutions to specifically earmark a sizeable proportion of their resources for advances to the poorer sections of the rural community?

Most importantly, what is missing is an attempt to integrate the various programmes which figure so prominently on paper: land ceilings and redistribution of land, debt relief, abolition of bonded labour, minimum agricultural wages, credit for the rural poor, and so on. Taken together these amount to changing the basic power balance in the rural areas. Such a change cannot be brought about by administrative devices perched on the periphery of the rural economy and society. It has to be politically organised. And the conditions for such political organisation appear to be getting more adverse.

CURRENT STATISTICS

EPW Research Foundation

The growth in reserve money has been contained, with the rise being only Rs 8,309 crore (4.9 per cent) in 1995-96 so far against an increase of Rs 15,814 crore (11.4 per cent) in the corresponding period last year. The rise in net RBI credit to the centre remains high at Rs 16,817 crore and the resort to *ad hoc* touched Rs 13,990 crore as on November 20. The allround sluggishness in the capital market since September 1994 continues. All major share price indices touched new lows with the BSE Sensex dipping to 2944 on November 24. Net monthly investment by FIIs has been declining since July this year, touching \$ 104.1 million in October. Foreign trade data for April-September 1995-96 indicate further widening of the trade deficit, with imports galloping at 33 per cent (non-POL imports rising by 37 per cent) and exports growing by 26 per cent. Foreign exchange reserves (other than gold), presently at \$ 17.6 billion, have been depleted by \$ 3.3 billion since the beginning of the year.

APOLLO TYRES

Capacity Expansion

PROMOTED in 1977 by Raunaq group with the Kerala government's equity participation, Apollo Tyres has a market share of about 13 per cent in the automobile tyre segment. Apollo Tyres manufactures all the major categories of automotive tyres at its two plants at Perambra near Kochi and Limda near Baroda. The Perambra plant with a capacity 38,500 tonnes per annum can manufacture 6,00,000 truck tyres, 1,20,000 radial tyres, 29,000 tractor tyres and 46,000 light commercial vehicle tyres. The plant has a capacity for production of 5,10,000 tubes and 1,00,000 flaps used between the tyre and the steel rim of the wheel. The Limda plant has an identical capacity and a similar product profile.

The company closed the financial year ended March 1995 with a sales turnover of Rs 577 crore, up by 8 per cent from Rs 534 crore in the previous year. Other income rose by 11 per cent. Total income moved up from Rs 473 crore to Rs 540 crore, a rise of 14 per cent. Provision for depreciation fell by a massive 73 per cent and was accompanied by a 4 per cent rise in the provision for tax. The company closed the year with a net profit of Rs 26 crore, up by 66 per cent from Rs 16 crore achieved in the previous year. A dividend of 35 per cent has been recommended by the directors.

The company has focused on the truck/bus tyre segment in the replacement market, which accounts for 70 per cent of the total demand for tyres while the original equipment market accounted for the rest. The future of the tyre industry in general appears to be bright with the recession ending and the demand picking up. In 1994-95 the industry grew at a rate of 18 per cent and it is expected to grow at a rate of 10 per cent per annum. Along with capacity expansion, Apollo Tyres plans to pick up the idle capacities of smaller units. The company has an arrangement with Tyre Corporation of India and Stallion Tyres wherein the companies will execute Apollo Tyres orders to specification and Apollo Tyres will sell them under its brand name. While TCI executes truck orders, Stallion caters to two wheeler tyres. The company has signed an agreement with Tyre Corporation of India for the purchase of 5,000 tyres of its total capacity of 25,000 tyres every year. In end 1994, the company took over Premier Tyres, Kerala's oldest tyre manufacturing company with a capacity of 25,000 tyres per annum. The company plans to invest Rs 1 crore to modernise the Premier plant and increase its production capacity from

the present 45 tpd to 100 tpd over the next three years.

Total exports for the year under review amounted to Rs 84 crore against Rs 77 crore in the previous year. The company penetrated into new markets like Myanmar, Ghana, Brazil and Kenya while at the same time consolidating its market share in the US, Canada, Afghanistan, West Asia, Egypt, Philippines and Vietnam. To strengthen its position in the international market, the company has set up a wholly owned 100 per cent export oriented subsidiary, Apollo International, which in the long run seeks to build up the exports of other goods and services around the core business of tyres.

Making a foray into merchant banking, finance and leasing, the company has promoted Apollo Finance with an authorised capital of Rs 10 crore.

Capacity expansion at the company's plant at Limda and Perambra is on the anvil. Their combined capacity of 113 tonnes per day would be increased to 150 tonnes per day in the first phase of expansion and gradually to 200 tonnes per day in 1996-97. The company is setting up a 500 crore radial tyre plant in Maharashtra with an installed capacity to produce 18,00,000 tubes and 12,00,000 flaps per annum. The company is widening its operations overseas by setting up joint venture manufacturing units in Vietnam and Sri Lanka.

The company has been accredited with ISO 9001 for its entire range of brands, being the first Indian tyre company to do so. A research centre has been set up by the company at Baroda to meet stringent requirements at home and abroad.

PARASRAMPURIA SYNTHETICS

New Ventures

Parasrampur Synthetic is engaged in the manufacture of polyester, nylon and other filament yarns.

The company closed the financial year ended March 1995 with a sales turnover of Rs 322 crore, up by 83 per cent over Rs 175 recorded in the previous year. Total income of the company rose by 83 per cent from Rs 181 crore to Rs 331 crore. Interest costs rose by 19 per cent from Rs 29 crore to Rs 40 crore. Provision for depreciation increased from Rs 11 crore to Rs 14 crore, a rise of 30 per cent. The company closed the financial year with a net profit of Rs 26 crore, up by 41 per cent from Rs 18 crore in the previous year. A dividend of 27 per cent has been recommended by the directors.

The polycondensation plant achieved a production of 23,340 mt against 15,495 mt in the previous year. Production of filament

yarn stood at 15,693 mt compared to 13,990 mt in the previous year. The cotton spinning plant commenced commercial production in November 1993 and achieved full capacity utilisation in March 1995. Being 100 per cent export oriented, 5,354 metric tonnes of yarn was exported to UK, Philippines, Spain, Hongkong, Switzerland, Mauritius, Canada, Korea and Bangladesh. Of the total sales of Rs 60 crore, export sales accounted for Rs 31 crore. Paras Fab International, the 100 per cent export-oriented unit for the manufacture of terry towels, with an installed capacity 1500 mt per annum started commercial production in March 1995. Exports during the year stood at Rs 16 crore, up by 316 per cent from Rs 4 crore achieved in the previous year.

The company is entering the area of waterways transport. It plans to launch a speed boat ferry service connecting Bombay to Mandwa in neighbouring Raigad district from March 1996. The investment envisaged for this venture is to the tune of Rs 75 crore.

A foray into floriculture comprising cultivating cutflowers and roses has led the company to form Parasrampur Plantations Floriculture with Dalsem Kassenbow BV of Holland which will hold a 15 per cent stake in the Rs 20 crore project which is to come up at Nashik.

GODFREY PHILLIPS

Foray into Entertainment

Godfrey Phillips, a B K Modi group company and one of the largest cigarette manufacturers in the country, has shown improved results for the year ended March 1995. The company diversified into tea in 1987 with the launch of Tea City, but the diversification has proved to be minor in nature as tea does not contribute more than 4 per cent to the turnover of the company.

The company closed the financial year with net sales of Rs 306 crore, up by 17 per cent from Rs 262 crore recorded in the previous year. During the year under review, the company earned good returns from deployment of its funds in the bonds of public sector undertakings, preference shares and inter-corporate deposits. As a result other income rose from Rs 3 crore to Rs 6 crore. Total income accruing to the company rose from Rs 266 crore to Rs 309 crore. The company achieved a substantial reduction in interest costs as a result of the use of cost efficient funds besides efficient inventory management. Interest costs came down from Rs 11 crore to Rs 7 crore, a decline of 32 per cent. Provision for depreciation and tax rose by 5 and 6 per cent respectively. The company ended up with a net profit of Rs 13

crore, up by 14 per cent from Rs 11 crore achieved in the previous year. A dividend of 50 per cent has been recommended by the board of directors.

For the year under review, the company registered a growth of 7 per cent in volume terms against a drop of 8.8 per cent in the previous year. According to the company, all its brands are doing "reasonably well" in their respective markets. Sales rose to Rs 19.43 crore from Rs 16.83 crore, a rise of 15 percentage points. The sales network was extended in the state of Bihar, and the main towns in Madhya Pradesh and Rajasthan. For the current year, the company hopes to increase its market share and turnover consequent to a further expansion of distribution network in these states and also in northern India.

Export earnings for the year under review stood at Rs 19 crore against Rs 20 crore. Enforcement of strict legislation by the German authorities against high pesticide residue in Indian tea made a significant impact on the export earnings of the company. A positive side to the export performance was the test launching of the company's brand in Oman in August 1994 which were well received. The exports to Kazakhstan also increased so much so that out of the total exports turnover, Kazakhstan accounted for 70 per cent followed by Oman and Mongolia. The foreign exchange outgo on imports, dividends and other expenditure stood at Rs 6 crore against Rs 5 crore in the previous year.

The company has been accredited with the ISO 9000 accreditation for its quality system and operating procedures implemented in its factory in Bombay. Godfrey Phillips India is the first cigarette manufacturing company to be awarded the quality control certificate.

The company is planning to shift its production facilities from Andheri to Thane dictated by the need for expansion. The operation spread over the next five years involves an expenditure of Rs 50 crore. Plans for capacity expansion on the anvil include doubling of production capacity from 6,000 by the year 2000. The company has decided to invest Rs 40 crore for upgrading of the existing facilities at its Andheri factory and also in the other two factories located at Ghaziabad in Delhi and Guntur in Andhra Pradesh. The company will seek technical knowhow from Japan Tobacco Company. The company with a 16 per cent share in the branded cigarettes market has plans to increase its market share to 21 per cent in the next five years.

Making a foray into the entertainment business, the cigarette-maker has tied up with US-based sports TV company ESPN to launch a 24-hour sports channel. The company was also planning to promote theatre culture in India. For this, the company has tied up with the US-based film production company, United Artists.

Education and Women

On the Beijing Agenda

Sadhna Saxena

Although education was not among the most important issues on the agenda at Beijing, the several workshops and discussions in the NGO Forum drew attention to how structural adjustment programme and related state actions, often repressive, have a direct impact on the quality and the reach of initiatives in the field.

EDUCATION has always been considered an important sector of social action. Depriving disadvantaged sections of the right to education is denial of right to equal opportunity. The cause of disadvantage being of caste, class, gender or whatever else. Thus, expectedly, struggles for equality have to come to grips with the problem of analysing education system and to seek ways to intervene in it to make it more egalitarian and progressive. However, by and large even the most progressive education discourses are limited to the questions of curriculum, methodology, content, etc, sometimes totally obliterating the issue of minority, ethnicity, identity and of course class, caste and gender. Concern about women's education, in particular girl child's education, has yet to emerge as a primary concern of even women's movement. Interestingly, this has been acknowledged as a major agenda by the international funding organisations and policy pushers but their overriding perspective seems to stem from their worries regarding population explosion and fertility control rather than education for its intrinsic value in individual and social development.

Concern for education was not a high priority area even in Beijing although there were quite a few workshops on women's education during the Beijing NGO forum conference. The importance given to education could be gauged by looking at the same statistics – on the whole almost 4,000 workshops were organised during that short span of 10 days and on the first two days there were about 750 workshops. Out of these, only 20 were on education. However, groups such as Asia South Pacific Bureau of Adult Education (ASPBAE), International Council of Adult Education and various groups from Africa, Latin America, Philippines, etc. did make efforts to put this crucial issue on the agenda.

These groups organised workshops on themes such as empowering indigenous women through adult education, education of the women migrant workers, the role of popular education in advancing women's movement, women's education in south-east Asia, women and literacy, mainstreaming gender towards a gender inclusive culture through education, etc. Concern was also expressed about the increasing rate of school drop-outs – a major chunk being the girl students. I could attend six such workshops which dealt with the specific issues related to education. Although this limited experience only gives a glimpse of the discussions regarding the education scene in Beijing NGO forum meet still the issues raised at these meetings are of general significance.

It is important to understand education in the context of economic changes that the Asian region is undergoing which have serious social and political implications. People from many countries do realise and articulate the impact of these changes on education. For example, in the south and south-east Asian countries transnational migration of workers is emerging as an important issue. During the conference there were many sessions related to the problems of such migrations. And in most of these sessions on transnational and migration within the country, education was discussed as one of the key issues. Workers from Thailand, Malaysia, Philippines, Bangladesh, Japan, Singapore, etc, who have migrated from their respective countries to foreign lands spoke about their living conditions. Sometimes in choked voices they described their ghetto-type existence where they are totally isolated – culturally, linguistically and socially – from the people of the 'host' countries. They are neither protected by the law of the land nor by any international moral code. In all such workshops on migration education of migrant workers

emerged as an urgent need. Emphasis obviously was not on reading and writing alone but on political awareness and struggle.

Many third world countries are going through the process of structural adjustment and bearing the brunt of it the education scenario is also changing very fast. Expenditure on social sectors, especially on food subsidies, health and education is being drastically cut down. The state is withdrawing from the social sector rapidly. As a consequence of this, it is feared, more girls will be taken out of the education process. Some Latin American and African countries are already experiencing this. Hence in all such workshops on migration, displacement, impact of globalisation and structural adjustment, impact on education was raised and discussed as an important social issue.

Women's education workshops, especially women belonging to minority communities like the tribal women in India and indigenous women in developed countries, pointedly raised the social issues such as discrimination of the minorities by the state, negligence and insensitivity to their culture and language, marginalisation due to the development process leading to displacement, loss of work, loss of identity and impoverishment on a massive scale. Australian indigenous women, who did not even engage a translator, in their broken English, talked about their cultural alienation from the mainstream and lack of educational opportunities for themselves. Women from Madhya Pradesh, India, very effectively raised the issue of the total absence of the problems related to lives of the tribals and struggles of their survival from the literacy primers and textbooks. They stated that the tribal communities in different parts of India are facing the threat of extinction of their identities.

ADULT EDUCATION AND STATE REPRESSION

In a country like the Philippines, it was reported, there is a situation of civil war resulting in a further set-back to the education process in general and more so in case of women. The only option left for the people in such a situation is to work in smaller groups and build up alliances with democratic groups. And an activist from Indonesia said that under the repressive military regime, like the one in Indonesia, there is no space for women's movement. Since 1965, women's movement activists have either been killed or jailed. Gathering of more

than 10 people is banned unless permission is obtained from the police. So, the only way to work there is to work in groups of 10 or less. This is the size of an adult education class in Indonesia, if it is allowed to function at all. There is no popular women's movement in Indonesia. So, in Indonesia people try to work in education in the context of this kind of social reality and education in such a situation means to learn to challenge the state.

Surprisingly even in a country like Nicaragua special efforts for women's education were made not by the state but by the autonomous women's groups and faced stiff resistance from the government. It is due to the emergence/presence of such groups the government had to provide some space. Even the Sandinista government's reaction to women's education, which challenged the patriarchal values and the existing power relations and used feminist methodology, was negative. The speaker from Nicaragua said that understanding the process of one's own exploitation is important but equally important is it to become part of a political process to be able to have a say in the decision-making. This, she said, could be achieved only through a sustained process of women's education.

In these workshops on women's education it emerged that all education efforts are located in the existing socio-economic and political context. There is no point talking about women's education without taking this reality into consideration. In fact, it was stressed by many participants, including participants from India, that women's education remains a sterile subject if it fails to weave the socio-political realities and the struggles for survival into the content and process of education.

A lot of concern was expressed on the state of research in the field of adult education. Nicaragua is probably one country where the literacy crusade was backed by thorough research input. The tradition, as was reported during one of the meetings, still continues. Otherwise not much research work is done in the field of women's education although this is a strongly felt need. Such need was also emphasised by the representative of the UNESCO Institute of Adult Education. In fact she made a very relevant point that the content of the reading materials, especially the primers and the text books, needs to be looked into carefully. For, the low priority of research in adult education, she feels, results in the kind of gender insensitive literacy materials which is produced in bulk. She strongly urged that we ought pay attention to the content analysis of the literacy primers. This is a very significant point as in adult education and literacy work

understanding of the context and research is pushed under the carpet and the whole education process has literally been reduced to a pathetic attempt at transference of reading and writing skills. And due to this limited understanding of education in general and women's education in particular, where the emphasis is on issue-based transference of information, most important being family planning, education has become a stagnant field. There were African women's groups which were trying to elicit more information on the content, curriculum and the administrative and political process since they thought that theirs are the only countries which are not working in these crucial areas. They were surprised to learn that these are the neglected areas even in countries which are boasting of successful literacy programmes. A very rosy and one-sided picture of India's government-run literacy programme, romanticising the role of 'unpaid volunteers', was presented by some of the Indian speakers. The trouble with such a presentation was that it gave a general feeling that Indians have such a naive understanding of education. Due to the painful experiences of the Asian and other third world countries, as stated above, there was a lot of emphasis on understanding the process of exploitation and seeing the education in that wider context. Lack of preparation to present an analytical and objective assessment by the Indian speakers left a lot unsaid which could have been a source of enrichment to the women's education discourse.

There were not many meetings, sessions or workshops dealing with specific problems and issues related to girls' education, that is, education of the girl child and young girls within the formal system (schools) and outside of it. However, a workshop organised by Mill's College, California, the US, on 'Equity, Science and Math Education - Innovative Curricula' was different and refreshing. The point of debate was: do woman and girls learn differently than males? Does their pace differ? Do they have different cognitive abilities? It was, however, clarified that the different pace or the difference in learning process *per se* does not imply inferior capabilities but differences exist and the present school curriculum does not take these into consideration and hence girls are put at a disadvantage. A few research studies were quoted by the scientist of Mill's College to substantiate this point. However, the participants, other scientists, college and university level teachers were not convinced. It was pointed out that probably such a general conclusion that women and girls learn differently cannot be drawn. Two experiences quoted from India, showed that the existing social conditions are not in

favour of girls education and this bias affects their self-confidence and self-esteem which in turn hinders the learning process. They are married off at a very young age and expertise in handling domestic responsibilities considered more important than schooling. These are external factors rooted in the structure of the society. They do not show any kind of inherent differences in learning process between boys and girls. It is more to do with the socialisation process. Even the most sensitive and innovative groups engaged in science and social science education fail to address to the special needs of the girl students. Their names, their pictures, their worldviews and perceptions, references to girl students and their women teachers is invariably missing from the books and the teacher's guides. Given the kind of resource constraint and patriarchal social structure we have in India, it was pointed out that investing in girl child's education, especially in science and technical education, is considered a wasteful exercise and this bias leads to dangerous conclusion of the type that girls are not capable of learning subjects such as higher maths and science. Considering this social ambience, a question was raised, should not the issue of difference in learning be seen in the context of the social reality of women? Isn't this a more important reason for the backwardness of the girl students? Doesn't the learning process depend on this and within these constraints the kind of space available to the girls and the niche girls are able to carve out for themselves?

And finally, in one of the workshops it was firmly stated that education is a site of conflicts. There are conflicting values, ideologies, worldviews, etc, which influence the process of education in different ways. If the issues related to curriculum, research, methodology, language, culture, social realities, etc, are not thrashed out in the context of education the danger of the imposition of the dominant worldview looms large which is presently reflected in the textbooks and primers world over. This worldview emphasises fragmented, issue-based women and girl child's education, for example, imparting information on population explosion and fertility control in the name of fertility awareness and women and child's development. While not undermining the importance of fertility awareness from women's perspective a more holistic concept of women's education emerged as an important need. It was feared that in the absence of such a concept, education for its intrinsic value would remain a distant goal and a diffused dream.

Drug Prices: Sharp Rise after Decontrol

Wishvas Rane

The sharp rise in drug prices has been facilitated by the new policy adopted by the government on drug pricing

UNDER the 1995 DPCO, drug units are entitled for 18 per cent post-tax return on net worth if bulk drugs are manufactured from the basic stages as against 16 per cent in the 1987 DPCO. This rise the drug manufacturers can claim justifiably. The bulk drug units making 6 APA and 7 ADCA intermediates for synthetic penicillin will now have to source penicillin G from local manufacturers to the extent of 70 per cent of their requirement. This government policy shows a clear shift in favour of domestic penicillin G manufacturers. An inevitable outcome of this is likely to be a price increase of semi-synthetic penicillins like ampicillin, amoxycillin and cephalexin.

The drug industry and trade had come to an agreement to increase the trade margins for decontrolled drugs in phases starting from July 1. The government has decontrolled a total of 67 bulk drugs and their formulations under DPCO 1995 and chemists are entitled to a higher margin for these products. The agreement provides for a 2 per cent increase in trade margins at 18 per cent to retailers from July 1 for all formulations of drugs which are outside the price control under DPCO 1995. The wholesale trade will get a margin of 9 per cent for the decontrolled drugs. A further 2 per cent increase in the retail trade margin and a 1 per cent hike in wholesale margin will be effected from January 1996 in the second phase. With these increases the retail margin will be 20 per cent and wholesalers' margin will be 10 per cent for all decontrolled drugs. This makes a total of 30 per cent for drug retailing and wholeselling.

According to a comment in *Express Pharma Pulse* (June 29, 1995), "A 30 to 40 per cent rise in the prices of most of the decontrolled drugs is expected from July 1995 with the agreement between the drug industry associations and pharmaceutical trade to hike trade margins taking effect. A further 60 per cent increase in prices of these drugs is likely from next year. An estimated Rs 25 crore is expected to be collected by the All India Organisations of Chemists and Druggists (AIOCD) from the drug units." In short the drug industry and the trade decide amongst themselves how much should

be extracted from the consumers, and the government takes the position of a silent spectator.

Normally 10 per cent free scheme is offered by many drug companies throughout the year but Table 1 shows the additional free schemes offered.

From Table 2 we find that the prices of nearly 20 per cent of the products and 28 per cent of the products and packs have gone up. The break up of the price rise shows that 11.17 per cent have shown a rise of less than 10 per cent, 5.32 per cent a rise of 10 to 20 per cent, 3.83 per cent a rise of 20 to 30 per cent, 2.30 per cent a rise of 30 to 40 per cent and 1.28 per cent a rise of 40 to 50 per cent. But strangely enough 3.80 per cent show a rise of over 50 per cent. Some of this rise may be of bigger packings. This has been the usual practice of the drug companies to increase the prices of different packings of products at different times. (See Appendix

Table for full list of products which have registered a price rise over December 1994 prices in September 1995.)

Over 100 per cent rise is recorded in 41 products and 11 of these are ophthalmic products of Bell Pharma. The top position is taken by Gesticaine, a local anaesthetic of S G Pharma with a rise of 221 per cent and followed by Glucagon (for hypoglycemic attack) Torrent 200 per cent, Hematrine (iron preparation) Sandoz 148 per cent, Daktacort (antifungal) Ethnor 147 per cent, Epsolin (anticonvulsant) Cadila 145 per cent, Depsomil (antidepressant) S G Ph 144 per cent, Septopal (antibiotic) Merck 139 per cent, Nutrisan (nutrition supplement), Sandoz 121 per cent, Alludrox Gel (antacid), Wyeth 114 per cent, Myambutol (antitubercular), Cyanimide 114 per cent, Corex (cough mixture) Pfizer 108 per cent, Testanol 25 (hormone) Infar 108 per cent, Lanoxin (cardiac drug), B Wellcome 105 per cent, Dilantin (anticonvulsant), Parke Davis 105 per cent and Enderine (nasal decongestant) Wyeth 104 per cent.

Ten products show a rise between 90 and 100 per cent, 7 products between 80 and 90 per cent, 17 products between 70 and 80 per cent, 10 products between 60 and 70 per cent and 33 products between 50 and 60 per cent. In this group the most commonly used products are Arovit (vitamin), Neosporin (skin ointment), Incidal (antiallergic), Zect (cough mixture) Prenatal

TABLE 1 FREE SCHEMES

Manufacturer	Brand Name	Scheme	Per Cent Free

(nutritional supplement), Gardinal (anticonvulsant), Sodium antimony gluconate (for Kala azar), Algipan (pain balm), Xyllocaine (anaesthetic), Escorlin (nasal drops), Diabinese (diabetes), Paraxin (antibiotic), Nebasulph (antiseptic), Triaminic (cough mixture), Arovit (vitamin). Pfizer has hiked the price of its tetracycline by going generic. The price of Gardinal, the most effective and the cheapest of anticonvulsants, has gone up by 50 per cent.

In June 1993, the prices were marginally reduced, but were increased in December 1993 reaching a maximum by June 1995. The comparative figures presented here are from *Monthly Index of Medical Specialities (MIMS)* December 1993 to September 1995: 5.32 per cent of the products have shown marginal decline in prices and the maximum decline is for norfloxacin, ciprofloxacin, famotidine, omeprazol, rifampicin, etc. The real price rise began from June 1995 and henceforth more and more products will raise the prices.

In September 1994, the government of India, ministry of chemicals and fertilisers, department of chemicals and petrochemicals announced modifications in the Drug Policy, 1986. Under clause 22.7.2(iv) 'Span of Control' it says "Government will keep a close watch on the prices of medicines which are taken out of price control. In case, the prices of these medicines rise unreasonably, the government would take appropriate measures, including re-clamping of price control." Now that 67 drugs have been decontrolled, it becomes the responsibility of voluntary organisations to keep track of price rise and force the government to take appropriate action.

Under clause 22.7.3 'Ceiling Prices' it says "Ceiling prices would be fixed for commonly marketed standard pack sizes of price-controlled formulations and it would be obligatory for all, including small scale units, to follow the price so fixed." Now in this category we will look at the prices of two most commonly used drugs, paracetamol and aspirin. The ceiling prices fixed and notified by the government of India under DPCO 1987 and continued to be in operation under DPCO 1995 are as follows (Order No 672(E), September 14, 1992)

Paracetamol 500 mg/tab strip (10 T) @ Rs 2.74; 125 mg/5 ml syrup (60 ml) @ Rs 7.04; 150 mg/ml drops (15 ml) @ Rs 6.58.

The actual prices prevalent today are. Calpol (Burroughs Wellcome) 500 mg tab (10 T) Rs 4.12 +50.36 per cent, 125 mg/5 ml (60 ml) Rs 11.67 +65.77 per cent. Crocin (Duphar) 500 mg tab (10 T) Rs 3.98 + 45.26 per cent; 125 mg/5 ml syrup (60 ml) Rs 10.78 +53.13 per cent; 150 mg/ml drops (15 ml) Rs 7.34 +11.55 per cent. Metacin (Themis) 500 mg tab (10 T) Rs 3.13

Arlidin	USV	10 T	8.36	12.60	50.72

+14.23 per cent; 125 mg/5 ml syrup (60 ml) Rs 8.21 +16.62 per cent, 150 mg/ml drops (15 ml) Rs 7.42 +12.77 per cent (Metacin prices have not gone up yet).

The popular brands of paracetamol prices are 65.77 to 11.55 per cent more than the ceiling price fixed by the government. The price of Calpol tablet has gone up by 40 per cent and syrup by 56 per cent and Crocin tablet has gone up by 35 per cent and syrup by 31 per cent.

Another way of circumventing the rules

and regulations is to make drug combinations.

One such example is Fortagesic of Win-Medicare. It contains paracetamol 500 mg and pentazocin 15 mg per tablet. Fortwin 25 mg pentazocin costs Rs 2.73 per tablet and Crocin 500 mg paracetamol tablets costs Rs 0.40. So 500 mg paracetamol and 25 mg pentazocin should cost Rs 3.13. But Fortagesic with 15 mg pentazocin and 500 mg paracetamol costs Rs 4.95 per tablet. Similarly Win-Medicare has another overpriced combination product of

paracetamol 450 mg + chlormezanone 100 mg costing Rs 2.50 per tablet.

The ceiling price of aspirin formulation (per order No 12(E) of January 4, 1988) is as follows. Aspirin 300 mg/tablet strip (10 tabs) @ Rs 0.64. Actual prices are as follows (for 10 tablet strips): Apidin (IDPL) Aspirin 200 mg +++ (10 T) Rs 2.42, Colsprin (Reckits) Aspirin 325 mg (10 T) Rs 1.92, Disprin (Reckits) 350 mg +++ (10 T) Rs 2.00, Micropyrin (Nicholas) 350 mg + (10 T) Rs 2.37, and Winsprin (Win-Medicare) 324 mg (10 T) Rs 3.73.

The brand prices are more than the ceiling prices from 483 per cent to 200 per cent. Besides none of these products conform to the standard formulation of 300 mg aspirin. This shows the inefficiency of FDA in allowing irrational formulations.

To top all this the drug companies have marketed small dose aspirin as anti-coagulants for prophylaxis in cases of increased risks of blood clotting. The government notified ceiling price of 300 mg aspirin/tab (10 T) is Rs 0.64, ASA 50 (German Remedies) 50 mg aspirin/tab (10 T), 6; and Aspicot (Concept) 80 mg aspirin/tab (10 T), 2.20. How can the government allow 9.38 times (938 per cent) the ceiling price to ASA 50 and a price rise of 24.08 per cent as well? If we can compare all the ceiling prices and find wide discrepancies this can be reported to the government.

Most of the expectorants (Benadryl, Brozedex, Cinaryl, Corex, Deacos, Luphist, Mit's linctus, Protussa plus, Solvin, Soothex, Sovental, Triaminic, Tristina, Zedex and Zect) show increase in price, ranging from 20 per cent to 220 per cent. Likewise vitamin formulations (Aquasol-A, Arachitol, Arovit, Becosules, Beetron, Beplex, Betonin, Bivinal forte, Citravite, Cobadex forte, Hexavit, Hovite, Hycibex, Macroberin, Pedic, Polybion, Stresscaps, Sukcee, Viseneral, Vitneuron, etc); minerals (Calcium-Sandoz, Cital, Citralka, Coslyte, Electral, Electrobiob, Filibion, Macalvit, Nutrisan, Ostocalcium, etc); iron preparations (Dexorange plus, Fefol, Fessovite, Hematrine, Hepatoglobin, Imferon, Phosphomin, Tonoferon, etc); and nutritional products (Bayer's tonic, Hemiphos, Kinetone, Livogen, Neogadine elixir, etc) show rise in price.

In the antituberculous products, the prices of ethambutol, and pyrazinamide have gone up. Among antibiotics tetracycline and chloramphenicol rates have gone up. Prices of hormones have consistently been raised and this time, we see the price of Aquaviron (without B12) has gone up by 41.36 per cent, Lynoral by 56 per cent, Orgalutin by 47 per cent and Testanon by 108 per cent. Most of the anticonvulsants like Dilantin, Epilex,

Epsolin, Eptoin, Garoin, Mysolin, Valparan alkalets, and Gardinal have also shown a price rise. Prices of sedatives and antidepressants continue to rise.

Some of the newer entrants in the drug industry have become intelligent enough to market only tablets – so that capital investment is less or one can get the tablets compounded on a loan licence – for vague indications, where doctors cannot complain that there are no results, and at very high prices so that there is no need to ask for an increase in rates. One such example is Serdia which has introduced the following products.

Rates (Rs)

Conversyl (antihypertensive) 10 T	201.47 (1 od)
Daflon-500 (cardiac) 10 T	158.64 (1 bd)

Dramicron (antidiabetic) 10 T	90.40 (1 bd)
Flavedon-20 (cardiac) 10 T	90.40 (1 tds)
Isomeride (antiobesity) 10 C	88.81 (1 bd)
Natrilix (antihypertensive) 10 T	37.10 (1 od)
Ponderax (antiobesity) 10 C	77.22 (1 od)
Survector (antidepressant) 10 T	119.96 (1 bd)
Trivastal LA (anti-parkinson) 10 T	141.55 (1-4 d)

(Od is once daily; bd is twice daily; and tds thrice daily.)

Are such high introductory rates for such products justified?

problems. It has been estimated that 45,000 children below 15 years are engaged in brass industries in Moradabad and 50,000 children in the bangle industries of Firozabad. In Lucknow, zari industry employs at least 45,000 children. Child labour is a feature of almost all the states. In diamond cutting and polishing industry of Surat at least 50,000 children do drilling and polishing in highly polluted environment for long hours which exposes them to several health hazards due to lack of basic facilities at the workplace.

The world conference in Vienna in 1994 recognised the important role the governments can play in improving the lot of children. It urged nations to mobilise maximum resources to reduce child mortality rate and provide nutritious food to all children. Unfortunately, no political party ever took to abolish child labour as children do not constitute vote banks. According to South Asian Coalition on Child Servitude, only voluntary organisations are doing the work of emancipating child labour. Non-government organisations can more effectively implement policies for revival protection and development of children. But most of the NGOs end up rendering the child labourers unemployed.

The NGOs always demand high priority to be given to the literacy of these children. Now, how can a child afford education after giving up his low waged job? If he goes to school he has to spend on his studies, while working not only was he earning but also contributing to family income.

Child labourers are paid low wages ranging from one-third to one-half of that paid to adult labourers, even if the output of the former is more. Some demand equal wages for child labourers. But laws hardly transform the society. Last year (till June 1994) 309 child labourers were 'released'. But now it has become a common feature to find one lot of child labourers being 'released' only to be replaced by other group of children. The inspectors upon whom lies the responsibility to enforce laws are often bribed by the employers. Of course, industrialists who exploit child labour on a large scale and get high profits, will not pay enough to the children till government exerts pressure.

Child labour is common in developing countries like Nepal, India, Pakistan and Turkey, etc. In these countries poverty and child exploitation go hand in hand. Instead of industrialisation which deprives the children of income earning opportunities, schemes for poverty alleviation and rehabilitation of child labourers are a better alternative.

Plight of Child Labourers

Pankaj

Though immediate intervention to alleviate the misery of child labourers is necessary, any attempt to render them jobless is equally uncalled for.

DELHI, where maximum number of organisations work for the welfare of child labourers and where laws for abolishing child labour throughout the country are formulated, has 18 per cent of its 25 lakh child population employed in various types of physical labour.

A report by the UNICEF says, the working conditions for child labourers are harsh in India. About 45,000 children work for almost ten hours a day in the various industries. In Delhi, a majority of the child labour is engaged as domestic servants. Vehicle repair shops and garages employ a sizeable number of the child labourers. Children can also be found working in dhabas, tea stalls and in small hotels to a large extent.

In UP, carpets industries in Mirzapur and Bhadoi and glass industry of Firozabad, and various other industries have 7-8 million child labourers. UP accounts for 20 per cent of the entire child labour force in the country. It is shameful that after 47 years of independence India has more than 5.5 crore child labourers. No serious attempt has been made to liberate them except the Child Labour (Prohibition and Regulation) Act, 1986 and the Factories Act in 1948.

According to the Centre of Concern for the Child Labour, at present 10,000

children are engaged in rag picking in Delhi, with last 15 years registering a rapid increase in their presence. The centre also mentions that girls constitute 30 per cent of the child labour. A large number of child labourers live on streets and this makes them more vulnerable to sexual and drug abuse.

A few months ago India found herself in an embarrassing situation when Germany refused to attend an international conference of carpet manufacturers organised by India on the grounds that the Indian carpets were made by the children. To abolish child labour, the European Community has passed the social clause to apply selective import restrictions on the countries who are denying minimum labour standard to their workers. The Indian carpet industry, which has a turnover of approximately Rs 1,400 crore, will suffer.

In Mirzapur-Bhadoi carpet belt 40 per cent of the carpet weavers are children below 14 years. Knitting, weaving and pre-processing in these carpet industries adversely affect their back and their eye sight and in a very short period they lose their fingers. Another 10,000 children work in the lock industry of Aligarh where they slog for 12-15 hours in dim light and amidst highly poisonous chemicals which make them prone to asthma and various skin

Muslim Women's Voices

Expanding Gender Justice under Muslim Law

Sabeeha Bano

An opinion survey among Muslim women in a section of Delhi indicates that while the enactment of a Uniform Civil Code is a difficult proposition, the objectives sought to be promoted through the enactment can be achieved equally well by a process of reform of personal laws through the internal initiatives of different communities.

EVEN though there has been a spate of research on women in India since the UN declared the International Women's Year two decades ago, little corresponding research exists in respect of Muslim women in India. The few studies that have appeared during the last two decades have been undertaken either with the commonly prevalent prejudice against Muslims in mind or were otherwise methodologically deficient in that they employed indices of measurement of women's status which had little relevance to the realities of their existence within the Indian environment. Therefore, studies on Muslim women are called for if a realistic assessment of the issues of concern to them and their community is to be formed.

Since little empirical research exists on Muslim women, the impression somehow exists that they have no voice and no feelings about the issues which concern them. This is particularly the case when it comes to the issue of gender justice. On this important issue, which has been highlighted time and again during the past several decades through the demand for enactment of a Uniform Civil Code applicable to all Indians, the debate has usually taken place among men. Even when women have raised the issue, their reasons for demanding a Uniform Civil Code have been taken over by men and equally, contested by men. What are women's sensibilities on this question has never appeared on the surface, and this has distorted an understanding of the problem in proper perspective.

Enactment of a Uniform Civil Code enjoined upon the state in terms of Article 44 of the Directive Principles of State Policy in the Constitution of India has proved to be an extremely contentious issue. The protagonists of the Uniform Civil Code do not as a whole belong to a common category in terms of the arguments which they use in order to buttress their demand for enactment of a Uniform Civil Code. Among them, there are a good many people who are strongly committed to democratic and liberal values and feel that the concept of a common citizenship enshrined in the Indian Constitution demands that there should also be a common law for all citizens. Others are motivated by very narrow nationalist or chauvinist ideas to demand a common civil code for all Indians. For them, a Uniform

Civil Code is a necessary condition for the promotion of a strong national feeling. Others still demand a Uniform Civil Code because they feel that the personal laws of the different communities, including Muslim Personal Law, are gender unjust, and gender justice may be easier to ensure through a Uniform Civil Code. On the other hand, those opposing the enactment of a Uniform Civil Code have couched their arguments in the democratic right of cultural minorities to continue to follow their distinct cultural traditions and personal laws.

This is not an appropriate place to undertake an examination of the rationale of the different arguments advanced to demand or oppose the enactment of a Uniform Civil Code. It is sufficient to indicate that the manner in which the debate on this controversial question has gone on, there has emerged a fair degree of consensus that enactment of a Uniform Civil Code in the present situation is not going to be easy. For one thing, the legal diversity which exists in this country is far too complex and bewildering and any attempt to force uniformity of legal practice will be generative of a great deal of social strife. Secondly, there also exists diversity with respect to jurisprudence or what might be considered the philosophy of law. Enactment of a Uniform Civil Code will entail reconciling these different principles of jurisprudence which is not going to be easy. Finally, personal laws of several tribal communities are sanctified by the Constitution and overruling them can lead to constitutional difficulties.

On the whole, consensus among large sections of opinion, except some hardcore liberals and nationalists, is tending towards the position that enactment of a Uniform Civil Code is not possible, but the question of ensuring gender justice remains. This should be ensured through the different communities taking the initiative on their own to reform their personal laws to give effect to considerations of gender justice without coercion from the state or any other agency. Such reform is also called for in the face of the emerging tension between the constitutional civil law as it has developed through the decisions of the Supreme Court and the personal laws of the different

communities. If the final enactment of a Uniform Civil Code is not to be made an eventual contingency in the face of the growing chasm between the constitutional law and the provisions of the personal laws, internal reform through rationalising the personal laws would appear to be a good strategy for those groups and communities which do not want to submit under pressure of either the liberals or the Hindu chauvinists to the tyranny of a Uniform Civil Code.

Our aim here is to articulate Muslim women's voice on this question by focusing on the response offered by women respondents on aspects of social practice and law which are the core of the issue of gender justice and the principal reason for the demand of a Uniform Civil Code on the part of those who feel that gender justice cannot be assured under traditional personal laws of the different communities in general and Muslim Personal Law in particular. Our analysis is based on the assumption that eventually consensus on the question of internal reform would be a suitable strategy to withstand pressure for the enactment of a Uniform Civil Code and in the process of that reform what Muslim women themselves think should be of critical relevance.

The data presented here was collected from a sample of 200 respondents drawn from the Muslim localities in and around the Jamia Millia Islamia in Delhi as part of a larger study designed to find out women's understanding of the Koranic and Muslim Personal Law provisions relating to divorce, marriage and inheritance, etc. From this study, we have isolated a set of questions for this discussion. Of the total respondents covered by this study, 194 (97 per cent) were Sunnis and 6 (3 per cent) were Shias. Most of them belong to the Ashraf category of social groups such as Saiyed, Pathan and Sheikh. The Saiyed women account for 30 (15 per cent), Khan for 37 (18 per cent), and Sheikh for 72 (36 per cent). Others belonged to intermediate or lower social groups of Muslims: Ansaris account for 15 (6 per cent), Sulaimani, Saifi and Dhobi for 22 (11 per cent), and Meo for 5 (3 per cent). The large majority of them, 142 (71 per cent) were between 26 and 45 years old, 28 (14 per cent) were below 25 years of age and 30 per cent (15 per cent) were above 46 years of age.

In terms of educational background, 37 (19 per cent) were informally educated, 125 (63 per cent) had received formal education and 38 (19 per cent) were illiterate. Of the formally educated respondents, 15 (8 per cent) were educated up to the fifth standard, 40 (20 per cent) were educated up to sixth to 12th standard, and 70 (35 per cent) were educated up to the degree level. Whether educated or not, most of the respondents, 147 (74 per cent) were housewives, two (1 per cent) were working in house-based economic activity, 10 (5 per cent) were self-employed, 40 (20 per cent) were in service, and one (.5 per cent) is in business. Of those

engaged in gainful economic activity, 11 (6 per cent) were earning up to Rs 500, six (3 per cent) were earning between Rs 500 and Rs 1,500, 10 (5 per cent) were earning between Rs 1,500 and Rs 3,000 and 26 (30 per cent) were earning more than 3,000 a month.

Since women enjoy limited autonomy in terms of what they do with their earnings and their access to the economic resources of their families, the respondents were asked a set of questions with respect to those aspects as well. Of those having an independent earning, seven (4 per cent) spend their earnings the way they want, and 46 (23 per cent) hand over their earnings to the husband to be spent on the family. Again, 87 (44 per cent) respondents said they were free to open and operate their own bank account, and 113 (57 per cent) admitted that they did not enjoy this freedom. On the whole, it would appear that the respondents are by and large living within a traditional family setting and are dependent on their husbands and families in terms of their daily course of life.

Their personal lifestyles further confirm this. Of all the respondents, only one is unmarried but lives within a family setting; 175 (88 per cent) are married, four (2 per cent) are divorced, 17 (9 per cent) are widowed and three (2 per cent) are separated, but they too are living with their paternal families. Of those married, 198 (99 per cent) had a traditional religious marriage and only one had a civil marriage. As many as 138 (69 per cent) pray daily (which does not mean that they pray five times daily; it only means that they perform at least one prayer daily), 40 (20 per cent) pray at least on Friday, and 19 (10 per cent) pray occasionally. One respondent said she prayed only during personal crises and two said they did not pray at all. Again, 156 (78 per cent) observe fast for all 30 days during Ramazan, 40 (20 per cent) observe fast on some days, and four do not observe fasts at all. As far as engaging in a reading of the Koran as a religious duty is concerned, 63 (32 per cent) read the Koran daily, 85 (43 per cent) read only sometimes, five (3 per cent) read only on special occasions and 47 (24 per cent) do not read the Koran as a religious duty. Of those who read the Koran, 70 (35 per cent) admitted that they understand the Koran and 83 (42 per cent) admitted that they did not understand what was there in the Koran even though they read it from time to time.

Since observance of purdah is considered a characteristics of Muslim women, the respondents were asked if they believed in the purdah and what was the precise form in which they themselves observed purdah. Of all the respondents 182 (91 per cent) said they believed in purdah and 18 (9 per cent) denied believing in purdah. Of those who said they believed in purdah, 65 (33 per cent) believed in wearing the burqa, 68 (34 per cent) believe in covering the head with the end of the sari or a dupatta, and 49 (25 per

cent) believe in observing purdah through proper behaviour without engaging in any adherence to form of dress. On the whole, therefore, the large majority of the women respondents covered are fairly typical Muslim women.

Since one of the areas at the centre of the controversy over the enactment of Uniform Civil Code is that of marriage and divorce, the respondents were asked a series of questions about marriage and divorce. Of all the respondents, 86 (43 per cent) reported that their formal consent to the marriage was sought by their parents, and as many as 113 (57 per cent) said that no formal consent to their marriage was sought from them. Again, 198 (99 per cent) were married through a 'nikah' ceremony. The payment of mehr promised by their husbands at the time of marriage ranged as low as Rs 100 and as high as Rs 40,000. Three respondents (2 per cent) entered marriage on a 'mehr' of less than Rs 100, 35 (18 per cent) on Fatmi mehr which is an amount equivalent to that fixed by Prophet Muhammad while marrying his daughter, seven (4 per cent) on an amount between Rs 100 and Rs 1,000, 25 (13 per cent) on an amount between Rs 1,000 and Rs 5,000 and 92 on an amount above Rs 50,000. This last category includes one respondent whose mehr was of the order of Rs 1,25,000. Interestingly, as many as 37 (19 per cent) respondents reported that they did not know what was the mehr fixed at the time of their marriage.

For all the respondents except one, their present marriage was their first marriage. It is often believed that the ease of divorce in the case of Muslims results in frequent casting away of the wife. If our data is to be relied upon, it would seem that divorce is not very common among Muslims. This is as true of men as much as women as our question with respect to the marriage of the respondents' husband shows that in the case of 187 (94 per cent) respondents their marriage to their present husband was also the first marriage for the husband. Only in eight (4 per cent) cases the present marriage of the husband was his second marriage and in one case the present marriage was a fourth marriage. Of those husbands whose present marriage is not their first marriage, only eight (4 per cent) had divorced their wife and three (2 per cent) had married a second time after having been widowed earlier.

Even though the overwhelming majority of the respondents have never been divorced and only eight (4 per cent) have married husbands who had been widowed or divorced earlier, the large majority of them are of the view that the practice of triple divorce is iniquitous to women. As many as 164 (82 per cent) felt that the practice of triple divorce should be abolished completely, while 20 (10 per cent) thought otherwise and another 16 (8 per cent) did not show a firm opinion on this matter. On the question of polygamy as many as 173 (88 per cent) want the

provision for polygamous marriages to be abolished completely, 14 (7 per cent) think otherwise and 13 (7 per cent) are undecided. Accordingly, on an overall assessment, as many as 76 (38 per cent) respondents felt that Muslim personal law discriminates against women, 70 (35 per cent) thought otherwise and another 54 (27 per cent) were undecided.

If such a large proportion of women feel that the provisions of Muslim personal law relating to triple divorce and polygamy are iniquitous to women and should be abolished or that Muslim personal law discriminates against women, the question naturally follows what they feel about how the reform of the law should be effected. Of all the respondents 76 (38 per cent) felt that Muslim personal law should remain unaltered which, in other words, means that in their opinion the personal law needs no reforms. The remaining respondents thought that changes or reforms in specific areas were called for. As many as 73 (37 per cent) felt that reform in respect of polygamy was called for, 62 (31 per cent) felt that reform in respect of custody of the child in the event of separation or divorce was called for, and 58 (29 per cent) said that the provisions regarding maintenance to a divorced or separated wife needed reform. Only one respondent also said that reform in respect to a woman's right in paternal property was required.

The broad consensus which seems to be emerging in Indian society with respect to the enactment of Uniform Civil Code is that such an enactment is a difficult proposition but the objectives sought to be promoted through the enactment of Uniform Civil Code can be achieved equally well by process of reform of the different personal laws through internal initiative of the communities themselves. Our discussion of the data from the respondents shows that there is a clear understanding of the need for this kind of reform as well as a clear understanding of the areas where such reforms are called for. Our respondents' specific answers also go to show this broad consensus. The respondents were asked to indicate whether a Uniform Civil Code should be enacted, or Muslim Personal Law should be retained as it is, or it should be reformed. Only 29 (14 per cent) respondents said that Muslim Personal Law should be replaced with a gender-just Uniform Civil Code, and a roughly equal number 30 (15 per cent) felt that Muslim Personal Law should be retained as it is. Of the remaining respondents, 35 (28 per cent) felt that Muslim Personal Law should be retained with minor changes and another 57 (29 per cent) said that Muslim Personal Law needs drastic reforms, but that these changes should be brought about within an Islamic framework. There cannot be clearer indication for the leaders of the community and greater reason for them to initiate the process of reform than this testimony.

Further Dispossessing the Tribals

Implications of Draft Forest Bill

Stephen Rego

The draft forest bill aims to increase the hold of bureaucratic and commercial-industrial interests over forest resources, further alienating the tribals from their environs.

WHILE the draft forest bill of the central government entitled, 'The Conservation of Forests and Natural Eco-Systems Act' has found few supporters outside the political establishment and the forest bureaucracy, there has been much discussion on various aspects of the proposed legislation even among those opposed to it. This was only to be expected, since critics of the bill encompass a broad spectrum ranging from urban based environmental groups, to NGOs working in tribal areas, academics subscribing to differing ideologies, and even some Marxist-Leninist political organisations.

Almost all the critics are unanimous in condemning the bill as undemocratic and anti-tribal. But, opinion remains divided on how to understand the role of the state and the forest bureaucracy, the intervention of the World Bank and other foreign agencies, the impact of the leasing out of forest land to industry, the advisability or otherwise of centralisation, the question of tribal subsistence and its possible adverse impact on the goal of conservation, to enumerate some of the more contentious issues. As part of this debate, a group of lecturers, researchers, lawyers, activists, who stand for a people-oriented forest policies, met at Nashik in February at a seminar organised by the Van Vidheyak (Forest Bill) Samiksha Samiti.

The keynote address at the inaugural session was given by Pradip Prabhu of the Kashtakari Sanghatana which works among the tribals in Thane district of Maharashtra. Recognising that the massive deforestation caused by a policy bias in favour of commercial and industrial interests over the last 100 years had created a crisis situation which threatened not only the environment, but also the very existence of the tribal communities, he questioned the commitment of the government to the goal of forest conservation. Despite the title given to the proposed act, there was little reason to believe its avowed aims because of certain basic flaws in its approach.

According to Prabhu, one of the most significant flaws was the centralisation of powers at all levels which will pave the way for greater authoritarian functioning. By disempowering the people and strengthening the hands of the forest officials, besides

increasing the powers of the centre vis-à-vis the states, it would only worsen the present undemocratic and arbitrary system of forest management. Since even ordinary forest officials would now have the powers to arrest merely on suspicion the bill would convert every adivasi who enters the forests, even if it was in search of subsistence, into a potential criminal.

Further, he criticised the bill for seeing no role for the tribal communities in forest conservation and management, even as it prepares the grounds for leasing out forest land to private parties, including industry. 'Captive plantations' as a raw material source could be ecologically dangerous, and it would be futile to believe that the problem of degraded forest land could be solved in this manner. In fact, the goal of preservation has only been achieved in those areas where the adivasi communities have been actively involved.

Finally, Prabhu stressed that it would be dangerous to look at the bill in isolation. The roots of the new legislation, and its apparently conservationist thrust, could be traced to the changes in the framework of the World Bank which have come about as a result of the pressure from people's movements and environmental groups. Since most of its earlier schemes have been shown to be environmentally harmful the bank has now set up the Global Environmental Facility (GEF) to route its loans. For availing of this finance, each member country has been asked to prepare an environment assessment and eco-development plan. The new bill is clearly part of this process. Prabhu asserted that experience has proved that an external agency like the bank cannot play any positive role, and this was further evident from the new legislation which he described as a 'TADA for the forest areas'. In conclusion, he pointed out that it was incorrect to welcome individual clauses of the bill as some environmentalists had done. It was necessary to view the bill in its totality and demand the complete withdrawal of the present draft.

Anand Kapoor of the Maharashtra Arogya Mandal, Bhimashankar project, gave a detailed account of 'Jungle-Jeevan Bachao Yatra' whose aim had been to focus attention on the plight of tribal communities living

in the wildlife sanctuaries. While the tribals in the Sariska game park in Rajasthan were prevented from collecting forest produce from within the boundaries, more than 470 limestone quarries had been allowed to continue operations within the same area despite a Supreme Court order banning this in 1993. Only mass struggles of the people had been able to check this practice. The yatris came across similar examples with respect to the Central Paper Mill that extracts bamboo from the Shoolpaneshwar sanctuary in Gujarat, and the Birla-owned Indaleo with regard to bauxite mining in the Radhanagari sanctuary near Kolhapur. The ban on cattle grazing by nomadic tribes in the Bharatpur sanctuary in Rajasthan actually had a negative effect, because the grass grew wild and choked the marshlands, thus destroying the natural habitat of the birds and driving them away. Kapoor argued that the goal of wildlife protection could only be achieved with the active involvement of the tribals, but, if the proposed legislation becomes law, the opposite is likely to happen.

PANCHAYATS OR PRIVATISATION?

Speaking on behalf of the Bharat Jan Andolan (BJA) Pradip Prabhu drew attention to the recommendations of the Bhuriya committee, consisting predominantly of tribal MPs, on the need to extend the provisions of the 73rd constitutional amendment relating to local self-government to the schedule areas. The amendment proposes that while the gram panchayats should enjoy greater autonomy, the gram sabha (village assembly) should have the power to monitor the panchayats. This would guard the panchayats against the present pattern where these bodies are mostly controlled by a narrow, corrupt elite section. Demanding that these recommendations should be implemented, Prabhu pointed out that this was only part of the process towards 'Adivasi Swarajya', the goal of the BJA, under which complete control over all natural resources would pass over to the local community, which would enjoy total political autonomy. The presentation sparked off considerable discussion, especially over whether genuine democratically functioning alternatives could be created in some pockets within the existing system, or whether a complete overhaul was required.

Manorama Savur of the Bombay university traced the historical evolution of the paper industry in the country and its relationship with the tribals and the forests. The industry had felled large areas of bamboo forests for its raw material needs, besides exploiting the tribals who are employed as contract labour for bamboo cutting at ridiculously low wages. Savur further explained how handing over control over forest lands to large industrial houses as proposed under the draft bill, could be detrimental, illustrating her

argument with the example of the Ballarpur Paper Mills near Nagpur owned by the Thapars. She also asserted that the state had not been neutral in this process but sided the paper mill owners through low tariffs and subsidised inputs, and often ignored the legitimate demands of the affected tribal communities. However, she stressed that such criticism should not lead to an argument against modernisation, or for romanticising the tribal existence, but be seen as a plea that the fruits of such development are evenly shared by all and not monopolised by a few large business families.

Stephen Rego contended that the context and implications of the proposed privatisation of forest lands needs to be explored. From reports it appears that the government plans to lease two million hectares of degraded forest lands, overcoming the ban on such leasing through a legal subterfuge. The land will first be leased to autonomous government bodies like the Forest Development Corporations (FDCs), who will in turn lease it to private industry. It should be recalled that the FDCs are one of the important channels through which World Bank finance for forestry schemes are entering the country, and that privatisation is an established principle of the bank. Taken together, this raises the question as to what exactly is the bank's agenda for Indian forests? This privatisation policy can be criticised not only on the grounds of control over natural resources, but ecologically as well, for it is apparent that 'captive raw material plantations' are no ecological substitute for the rich and varied natural forests that industry itself has earlier destroyed. It is clear that "the needs of the market will only dominate over the needs of the people and the environment" under such privatised planning.

ARCHIVE OF FOREST MANAGEMENT

Rajinder Singh Negi of the People's Union for Democratic Rights (PUDR) gave a historical overview of government's forest policy. The successive legislations from British times served the purpose of demarcating areas as protected or reserved for commercial and industrial exploitation, thus depriving the adivasis of their traditional rights. Negi lamented that the post-independence approach of the Indian government was no different. Though the 1952 and 1988 policy resolutions of the government spoke of the need to encourage involvement of the tribal people in forest management, such an approach had rarely been brought into practice. Against this backdrop, Negi pointed out that though the proposed bill sounded as if it had a different outlook, closer investigation revealed that it was basically similar to the act it sought to replace, besides adding a number of new anti-people conditionalities.

Negi's presentation sparked off a discussion over the nature of the regulatory mechanisms that existed prior to the advent of the colonial administration. Knowledge of these customary laws and practices are weak largely because these were part of the oral traditions and the British administrators tended to ignore that which was not written while formulating their policy. Many participants observed that a number of these valuable traditions were dying, and it was of the utmost urgency to gather information on them for they could form an important basis for formulating a pro-people policy. There was a general agreement that while some facts could be gathered from the colonial administrative records of the various departments, other important sources of information would include the literature produced by and the documentation of people's movements historically, and through activists involved in organising tribals today, who could gain an understanding of the significance of many socio-cultural practices in the process of integrating with the people.

The discussion provided a natural background to JJ Roy Burman's presentation on 'Dynamics of Tribal Sacred Groves'. Explaining that these were certain historically demarcated parts of the forests which remained untouched because of their association in tribal culture with different deities, Burman argued that this was an assertion of tribal self-identity, "establishing norms against the profligatious use of nature". He criticised the attempts of both the government and some foreign-funded organisations for the preservation of these tracts, arguing that people themselves should be empowered to do this. He concluded that while such traditional structures should not be romanticised, they reflect the need to develop such age-old systems and other customary practices as the basis for current management principles.

Burman's observations generated a strong debate on the role of NGOs as catalysts of change, activist intervention in traditional practices, and the conflict between modern scientific ideas and the age-old tribal culture. A general consensus was that there should be a critical acceptance of tradition, helping the people to differentiate the good from the bad. For example, while knowledge of science should be disseminated to eradicate a belief in the supernatural, and discriminatory rules like the ban on entry of women into the sacred groves should be sought to be overcome, the essential principles of these tracts could be oriented towards autogenous social development and management of the environment.

Satyakam Joshi focused on the situation prevailing among the tribals in the forest belt of Gujarat. Tracing the history of the forest

labour co-operatives (FLCs) set up in the 1940s, he showed in spite of increase in education and awareness among the tribal population at large, such bodies have tended to be dominated by a small propertied section who have sacrificed the interests of the majority to become corrupt power brokers. On the one hand, the widespread pauperisations that now exists in the tribal tracts of the state presents a depressing picture. But, on the other, the growth of organisations in the Dangas, Bharuch Panchmahals and other parts of south Gujarat which are involved in taking up the issues of the people provides hope for improvement and change. Recently, the public pressure built up by such groups has forced the Gujarat government to begin the process of implementing a ten-year-old government resolution regularising all ownership rights of the tribals on forest land being cultivated prior to 1980. Joshi stressed that such cultivation is crucial for the subsistence of the tribals, and is not the major threat to the environment, as the draft forest bill makes it out to be.

Later, representatives of the Kashtakar Sanghatana, Bhoomi Sena, and the Adivasi Shetkari Shetmajoor Sanghatana traced the history of their organisations and the types of issues and struggles taken up by them. The reports described how each organisation had mobilised the people to demand the regularisation of forest plots, fought against illegal felling by private contractors, opposed the harassment by forest officials, etc.

The concluding presentation by Eknath Salve, on the implications of the new bill for the democratic rights of tribals, criticised the increased powers proposed to be given to the forest officials. For the tribals of Chandrapur and Gadchiroli districts, harassment and arbitrary arrests have already become common in the name of dealing with naxalites, and the situation would only worsen if the new bill became a law. He said that the very process of drafting the legislation was undemocratic since tribals and tribal organisations had not been consulted, and argued that it was only a 'perspective from below' that could lead to a genuinely democratic system of governance. Since the proposed bill lacked this, it was the duty of all democratic minded individuals and organisations to firmly oppose it.

During the discussions, it was constantly highlighted through various examples that if the goals of conservation are to succeed then the participation of tribal communities, if not their total control over the local natural resources, is absolutely essential. Any other perspective had to be summarily rejected. The seminar therefore concluded with the participants resolving to campaign against the proposed legislation and demanding its total withdrawal.

Continuing Sanctions against Iraq

Ninan Koshy

The 'information gap' regarding Iraq's weapons programme has been effectively used by the US to continue enforcement of sanctions against Iraq.

THE mandate of the recent referendum has declared that Saddam Hussein intends to stay in power for a long time to come. This will strengthen US resolve to continue UN sanctions against Iraq more than all for the evidence about the technical aspects and 'information gap' regarding Iraq's programme on weapons of mass destruction. But the divisions within the UN Security Council are bound to deepen as economic interests increasingly shape the policies of the concerned countries on the sanctions issue.

The sanctions regime has been in place for more than five years and its prolongation ensured by ever widening interpretation of the relevant Security Council resolution by the US. But as trade and related factors determine the policies of several countries and the true nature of the tragedy of the Iraqi people caused largely by UN actions emerges, the sanctions regime will be weakened and its legitimacy lost. Meanwhile, Saddam Hussein's mistakes and miscalculations will provide his foes enough ammunition to continue the punishment of the Iraqi people.

It is significant to note that the UAE and the Arab League have made calls for an end to sanctions, mainly on humanitarian grounds. These calls represent a new awareness among large section of people in the region that the punishment has gone too far.

The punitive sanctions regime imposed in August 1990 has already taken a tragic toll among the most vulnerable Iraqi civilians. According to the UNICEF representative in Baghdad Thomas Ekfal, half a million children, more than 9,000 a month, had died of malnutrition and disease because of sanctions. Another 1.5 million are in danger of dying if the sanctions were continued. An additional three to four hundred thousand Iraqi civilians, the elderly and chronically ill, also have died as a result of lack of medical supplies. Other humanitarian agencies also have cited similar figures.

Sadrudin Aga Khan, who was the executive delegate of the Secretary General for a UN Inter-Agency Humanitarian Programme for Iraq, Kuwait and Iraq/Turkey and Iraq/Iran border areas, immediately after his war against Iraq in his report of July 15, 1991 had raised the basic contradiction in imposing sanctions on a country devastated by a war of high-tech and overkill waged in the name of the UN. He said:

This mission has addressed the current humanitarian needs in Iraq and has concluded that their magnitude requires funding which

exceeds international and short-term palliatives and can only be met from the country's own reserves. How this finding is to be reconciled with the Security Council's imposition of sanctions is a determination which is not ours to make.

CONCORTING LINKS

It was Security Council Resolution 661 adopted on August 6, 1990, soon after the Iraq invasion of Kuwait, that imposed sanctions on Iraq under Chapter VII of the Charter of the UN, prohibiting all states from importing into their territories any commodities and products originating in Iraq and from exporting any commodities or products to Iraq and also prohibiting all financial transactions with Iraq. The only exceptions were supplies intended strictly for medical purposes and foodstuff in humanitarian circumstances.

After the US-led coalition defeated Iraq, the Security Council adopted Resolution 687, paragraph 22 of which reads, "[the council] decides that upon the approval by the council of the programme called for in para 19 above and upon council agreement that Iraq has completed all actions contemplated in paras 8,9,10,11,12 and 13 above, the prohibitions against the import of commodities and products originating in Iraq and the prohibitions against financial transactions related thereto contained in Resolution 661 (1990) shall have no further force or effect." Para 8 deals with Iraq's unconditional acceptance of the destruction, removal or rendering harmless under international supervision of all chemical and biological weapons and all ballistic missiles with a range greater than 150 kms. Paras 11, 12 and 13 are about nuclear weapons and nuclear-weapons related materials. Para 9 deals with international mechanisms and para 10 with monitoring.

Subsequent resolutions and decision of the Security Council have defined the procedures to be followed and the UN special commission (UNSCOM) has worked closely with the International Atomic Energy Agency (IAEA). The commission has dealt mainly with missiles and chemical and biological weapons while the IAEA has concerned itself with nuclear issues. In the first two years, the UN inspectors were frequently obstructed in their work by Iraq. Iraq then began to extend co-operation and its acceptance of resolution 715 calling for long-term monitoring was an important step towards compliance.

Therefore para 22 of Resolution 687 is understood to mean that upon completion of all actions specified therein the sanctions should come to an end. But the US has refused to accept this interpretation. In an article, in the *New York Times* (April 24, 1994) the secretary of state, Warren Christopher, wrote that the US did not believe that Iraq's compliance with para 22 was enough to justify the lifting of the embargo. This is the position which the US permanent representative in the Security Council, Madeline Albright, has religiously maintained.

During the 20th review of Iraq's response to the council resolutions in July 1994 Albright issued a statement containing a long litany of unfulfilled requirements by Iraq without a single word of appreciation for its co-operation with the UN special commission. The statement made it clear that the US still awaited Iraqi compliance with virtually every other obligation called for by the council. These included recognition of Kuwait's sovereignty, independence and territorial integrity and its international borders, cessation of terrorism at home and abroad; an end to the economic warfare against the Kurds, an end to the repression in the Southern Marshes; a response to inquiries on the hundreds of Kuwaiti and other nationals missing since the Gulf war. According to the *Wall Street Journal* of July 18, 1994, president Clinton wrote to all council members stressing that the US, which can veto any council decision, gives a high priority to the continuation of the sanctions.

In insisting on the condition about the human rights of the minorities in Iraq, especially the Kurds, the US links Resolution 687 (related to destruction of weapons of various kinds as condition for lifting sanctions) with Resolution 688. Resolution 688 condemned "the repression of the Iraqi population in many parts of Iraq, including most recently in Kurdish populated areas", asked the Iraqi government for open dialogue to ensure human and political rights of all Iraqi citizens and for access of humanitarian organisations, and co-ordination with UN humanitarian programmes.

Some western powers, notably the US and UK, sought to establish a link between Resolution 687 and Resolution 688 from the beginning. That there is no actual link between the two is clear. There is no reference in Resolution 687 to human rights issues and domestic policies of the government in the conditions imposed on Iraqi government. Resolution 688 is only on human rights and humanitarian issues and does not refer to UN actions against Iraq on the Kuwait issue and does not mention Resolution 687. While Resolution 687 is under Chapter VII of the Charter, the only reference in Resolution 688 to the Charter is to Article 2, para 7 which deals with the domestic jurisdiction of the states.

However, in the action taken by some member states and subsequently legitimised by the UN, the two resolutions were increasingly linked. The proposal for the

establishment of a 'safe haven' for the Kurdish refugees in northern Iraq was on the basis of such a link.

At a press conference in Luxembourg on April 8, 1991, after the meeting of the European Council, prime minister John Major said that at the meeting he had put forward an action plan that was 'intended to build on Resolutions 687 and 688'. He thus not only linked the two resolutions but was ready to go beyond them. He linked sanctions especially to the treatment of Iraqi Kurds though there was no basis for such a link in the Security Council resolutions. The prime minister added a new condition to lift embargo and said that total embargo should be maintained as long as Saddam Hussein remained in power. The last condition was also endorsed by president Bush and has apparently continued to be the US position even under president Clinton.

ECONOMIC MOTIVES

Of the conditions laid down by Ambassador Albright in July 1994, the first one related to Kuwait was fulfilled by Iraq in November 1994. In what was known as the 'October crisis', when Iraqi republican guards division moved to the Kuwait border, the US response for military action was quick and the division had to be pulled back. Iraq yielded to the Security Council demand that it recognise Kuwait's independence, sovereignty and UN demarcated borders. In fact, Iraq accepted even US demands on the modalities of the action when the recognition was ratified by a vote in the National Assembly, officially approved by the government by action of the Revolutionary Command Council of the Ba'ath Party in a decree and published in the official gazette.

Though Iraq literally fulfilled the demands, the response of the US bordered on indifference. It was not ready to acknowledge the Iraqi action as an important step. This was partly because of the differences among the Security Council members regarding response to the October crisis and Moscow's direct dealings with Baghdad. In fact, the Russian foreign minister, Kozyrev, had claimed that he got the agreement that Iraq would recognise Kuwait in return for Russian efforts to get the sanctions lifted.

The October crisis brought to the fore the economic rather than political factors that decided the sanctions policy of major powers. The US was highly critical of what it thought was the soft approach of Russia and France to Iraq's action. French defence minister Le'otard's comment that the rapid US response was not unconnected to its domestic policies, and Kozyrev's diplomatic efforts, angered the US. US officials hit back at France and Russia by telling reporters 'off the record' that the two countries had selfish reasons for showing more tolerant attitude towards Saddam. It was noted that both countries were major arms suppliers to Iraq before 1991 and both had huge debts to be repaid by Iraq and therefore expected to profit once Iraq's oil is released for sale and Iraq

began major reconstruction. It did not go unnoticed that the US and Britain were not exactly acting out of pure altruism. Both countries have been criticised for rapaciously lapping up all the plumb contracts from Kuwait and Saudi Arabia after the Gulf war, leaving the French and the Russians out in the cold.

Most important, however, is the fact that the US does not want anything that would affect Saudi Arabia's cash flow since American companies hold orders there for US \$ 30 bn worth of weapons and \$ 6 bn worth of commercial aircraft. Competition from Iraqi oil would have a severe impact on Saudi Arabia which could lower its price or reduce its output. The last thing the US wants is to see Iraqi oil in competition with the Saudi's. It is believed that one of the trade offs in the Gulf war was a secret commitment by Kuwait and Saudi Arabia to guarantee cheap oil to the US.

Russia's concerns are primarily economic. Iraq was once one of its most valuable trading partners, and now facing desperate shortage of hard currency and internal economic crisis, a resumption of economic relations is becoming urgent. Reports indicate that Russia has already signed agreements with Iraq for \$ 10 bn in trade and for rescheduling of Iraq's \$ 7 bn debt. France broke ranks with the Gulf war allies when it began to take steps to restore diplomatic relations with Iraq. Iraq's deputy prime minister, Tariq Aziz, was officially received by French foreign minister (now prime minister) Alan Juppe in January this year. While France's interests also are mainly economic, it wants to show that, as always, it has an independent west Asian policy. Turkey and Iran have ignored the sanctions for the past one year to barter goods and food for Iraqi oil while the Iranian and the UAE flagged ships were accused by the US in December 1994 of smuggling oil.

European governments and companies are aware that the US itself will be a competitor for trading rights after the sanctions are lifted. There are many who believe that the US insistence on the sanctions is motivated more by economic than political factors. An official of the European Commission said an year ago, "We suspect that the US may put a heavy price on the lifting of sanctions, a price that may include exclusive trade ties", and compared this to the situation in Kuwait and Saudi Arabia after the Gulf war when US companies got almost all the big contracts.

With regard to Iraq's actions in compliance of the relevant UN resolution, favourable reports by the UN Commission have been regularly downgraded or ignored by the US, producing evidence on extraneous issues and linking it to the conditions. The 'information gap' of the Iraqi government and its occasional misadventures have been effectively utilised by the US. It is known that just prior to the October crisis of 1994, the UN weapon monitors were ready to report that Iraq was co-operating and meeting UN-imposed conditions with regard to missiles and weapons of mass destruction.

The movement of the republican guards division destroyed whatever credibility Iraq had gained from the report.

Baghdad's 'information gap' has been mainly on its biological weapons programme since the 1980s. The UN commission has maintained that Iraq has failed to provide a full and complete accounting of its past biological weapons programme. The only remaining obstacle was the unclosed biological file. With regard to chemical weapons and ballistic missiles the commission was satisfied with the information. Although some issues remained, the commission has stated that as far as setting up and operating the monitoring system, it received full co-operation from the government. The claim by a defected Iraqi scientist that Iraq had a crash programme for making nuclear weapons was enquired into by the UN commission. Iraq itself admitted that it had such a programme in August 1990 soon after its invasion of Kuwait but it had to be given up.

The defection of Saddam Hussein's son-in-law Hussein Kamal and some statements he made regarding Iraq's weapons programme prompted the government to provide new information on its armaments of various types. Thousands of previously withheld documents were handed over to the UN commission. This has naturally reinforced the impression that Iraq has not filled in all the gaps in the information on its military capabilities. The US has already claimed that the surveillance system is inadequate and has to be restructured and upgraded.

But more than all such new evidence, it is Saddam Hussein's declaration that he intends to be around for long that will decide US and UK policy on sanctions. Sadruddin Aga Khan's report of July 1991 said:

It remains a cardinal human principle that innocent civilians – and above all the most vulnerable – should not be held hostages for reasons beyond their control. Those already affected by war's devastation cannot continue to pay the price of a better peace. It is a peace that will also prove to be tenuous if unmet needs breed growing desperation. It is clearly imperative that Iraq's essential civilian needs be met urgently and that rapid agreement be secured on the mechanism whereby Iraq's own resources be used to fund them to the satisfaction of the international community.

The latest UN Security Council resolution on such a mechanism is Resolution 986 which was adopted on Good Friday this year. This would allow Baghdad to sell \$ 1 bn worth of oil every 90 days. Of the \$ 1 bn, 300 will go to UN Gulf war reparations and 200 m to UN agencies providing relief to Kurds in northern Iraq. The rest of the amount can be utilised by Iraq to purchase relief supplies. The conditions attached to this have not found acceptance from Iraq. A modified mechanism with arrangements more acceptable to Iraq is urgently needed at this time when the humanitarian situation is becoming desperate and there is indication of some flexibility on the part of Iraq regarding such mechanism.

Nineteenth Century Indian Stagnation

Colin Simmons

Finances in the Early Raj: Investments and the External Sector by Arun Kumar Banerji; Sage Publications, New Delhi, 1995; pp 338, Rs 375.

THIS intelligent, well-written and thought-provoking book is aimed at the regrettably small number of connoisseur economic historians of modern Indian finance. Like its two predecessors, *India's Balance of Payments, 1921-22 to 1938-39* (Asia Publishing House, Bombay, 1963), and *Aspects of Indo-British Economic Relations, 1858-98* (OUP: Bombay, 1982), together with the penetrating article on transfers and deflation over 1860-1900 published in *World Development* (Vol 18, October 1990), Banerji has re-stated in his characteristically cogent way, the importance of returning to the specifically imperial theme when examining the performance of the Indian economy at a crucial juncture - the second half of the 19th century. In the light of the steady, Cambridge-orchestrated scholarly movement away from such a top-down perspective - itself, of course, a reaction to both Marxist- and Nationalist-inspired historiography - the appearance of this work is timely.

The theoretical anchoring of Banerji's work in general, and this offering in particular, is neo-Keynesian in the mould of Michael Barrat-Brown's original, and Alan Thirwall's more recent, characterisation of a tradition embracing such diverse luminaries as John Knapp, Joan Robinson, Roy Harrod, Evsey Domar, and James Meade (though none, save the last named, are specifically alluded to in the text). The analysis therefore uses the familiar, textbook terminology of national income factor flows; concentrates on public finance and takes in the supply of money; focuses upon physical - rather than human - capital; highlights the importance of savings and especially investment rates; and naturally incorporates the international dimensions of 'tribute', transfers and exchange mechanisms. This is at once a strength and a weakness: on the one hand, it provides a coherent and recognisable base upon which to build and organise the description, and in this sense has affinities with rival operating frameworks such as the neoclassical, the Marxist and New Institutionalism; but, on the other, it is now rather old-fashioned. The theoretical discourse has moved on, and if Banerji wants

us to accept the key logical premises of his version of Keynesian economics then he really needs to spell out his position on the relevant aspects of the current debate featuring, amongst others, the post-Keynesians and the emergent rational choice theorists. It would have been useful, for example, to have been provided with an overarching model encompassing the clutch of 'internal' and 'external' variables that are considered either implicitly or explicitly. The fragile and uncertain nature of the statistical series makes this task more urgent - rather than the opposite as the author seems to suggest (p 226). However, this is a tall order, and Banerji earns our collective gratitude for at least attempting to address the problem of applying the theory of adjustment to the broad macro aggregates of the Indian economy over this period.

The author has managed to compress a considerable amount of original empirical research and a great deal of thought into seven main chapters which, in turn, are divided into three parts. The Introduction sets out the aims and objectives, identifies the basic problem of stagnation, considers the macro-level links between national income, investment and international transfers, attempts a brief, but penetrating, literature survey and outlines the overall argument. This is a concisely written chapter which repays the careful reader. It also strikes a suitably modest note: Banerji does not claim that the secular deflation brought on by the transfers was the only, or even the most important, factor behind the disappointing growth rate; rather he wants to argue that it merits serious consideration alongside other explanations. This seems to be a sensible position, but I harbour two largely methodological reservations. First, in the absence of the sort of model I mentioned earlier, it is hard to judge how to 'weigh' the relative degree of importance of this factor; and furthermore, because Banerji rarely has the temerity to step outside his particular furrow, it is not clear how the transfer problem articulates with "all the other factors which may have contributed to this uniquely unfortunate result" (p 27).

Second, although there is plenty of informed critical commentary on specific public policies, the alternatives are only mentioned indirectly. This is a problem on several counts: public choice theorists would certainly suggest that unless the possible effects of an alternative regime are discussed systematically the judgments lack any firm standard; and the chomesticians would likewise consider the absence of any counterfactual reasoning to be damaging.

Part One (untitled, unfortunately like its two successors) contains just a single chapter covering government finance. The treatment is impressive, the broad-brush is wielded with restraint and yet produces a revealing picture of the mentality and execution of colonial finance. This chapter could be of interest to students of imperialism outside the subcontinent since, for most other developing countries, the absence of tolerable estimates of national income precludes an exercise relating such series to the level and growth of public accounts. However, a surprising omission from the list of references is Davis and Huttenback's ambitious volume *Mammon and the Pursuit of Empire*: had this been consulted a more comparative context might have been attempted. The main heads of revenue and expenditure are described very competently, and certain policy and administrative matters are considered in a critical, but scrupulously impartial, manner. The problems connected with the innovation of fiscal decentralisation, and the extent and significance of the borrowing in both India and London are particularly well handled. Banerji decomposes the accounts with skill and illustrates the predominantly regressive character of tax receipts on the one hand, and the unambiguously non-development orientation of government spending on the other. As an aside, I found Banerji's admonitory remarks on Lord Northbrook's fiscal acumen - witness his decision to axe the income tax proposal in 1873 - to be rather amusing (p 37) in the light of the recent Baring Brothers debacle (he, Northbrook, is taken to task despite hailing from that well known banking firm). More seriously, the verdict that the politicians and the much vaunted ICS failed to construct a "fiscal structure appropriate to a sprawling empire of over 200 million people" (p 65) is well supported by the evidence adduced here. Instead of facing up to the enormous challenges of mass poverty and recurrent famine the India Office spent an inordinate amount of time examining the annual

budgets, and were far more concerned about "pettifogging details" than providing "guidance for policy" (p 66). This is a telling critique

Part Two has three inter-connected chapters on the complex, but obviously vital, question of irrigation. The first of these is at the policy-making level, and deals with construction, funding and charging. This is the longest single chapter of the book and, totalling just over fifty closely argued and detailed pages of writing, is sometimes hard going despite the number of sub-headings. The contributions of Elizabeth Whitcombe and Ian Stone can be understood better by a first reading of this chapter. Of particular interest is the discussion of institution-building, notably the important yet sadly neglected, Public Works Department. The issue of the Water Rates is well brought out, and the notorious Famine Insurance Taxes which "arrested irrigation for a quarter of a century" (p 129) are considered in depth. The pivotal role of individual – most notably John Lawrence and Richard Strachey – is not neglected, but is placed correctly in the wider administrative and policy setting. Chapter Four concentrates on Punjab, "the greatest recipient province of public investment in irrigation. As a case study this is a rather disappointing effort, although it has a useful survey of the agricultural and agrarian features of the area, especially the A Punjab Settlement (pp 141–44), and the Tenancy Act of 1868 (pp 145–48). Despite the relatively high levels of investment, Banerji argues that "achievements fell short of the plans and the needs – due to infrastructural deficiencies and London's intransigence" – and goes on to comment that "if this is how the Punjab fared, it is small wonder that many other parts of the country showed even greater stagnation" (p 149). The remaining chapter examines five major canal projects – the Western Jumna, the Bari Doab, the Sirhind, the Orissa, and the Son. The detail here is impressive, and the arguments for and against are keenly probed. The range of technical, engineering and canal water marketing problems are all rehearsed (pp 189–91) – and running throughout is a consideration of the efficacy of the PWD at the provincial and imperial levels. This work can help to lay the foundations for any future appraisal of the public and private costs and benefits of the schemes.

Part Three is composed of two substantial chapters, and just five pages of concluding observations. Chapter Six looks at investments in the economy over the period 1860–98. The railways occupy pride of

place, and there is also some revealing discussion on private domestic investment. New estimates of the aggregate figure are presented with due care and caution (Tables 6.2 for 1860–61 to 1879–80, p 216f; and 6.3 for 1880–81 to 1897–98, p 218f). There are of course gaps and guesses, but these make interesting reading, and should in time become our standard series. Excluding 1894–95, between 1873 and 1898 Banerji calculates that total investment amounted to 6.6 to 8.8 per cent of national income at current prices (p 225); in turn this yields an average of 7.5 per cent for the quarter century under consideration. This takes us to the heart of the problematic of the book. Using Moni Mukherjee's series of national income accounts (rather than the more recent but still flawed estimates of Heston), the vital question is why income grew by an average annual rate of only 1.5 per cent when the investment was running at over five times that figure. This focus upon the neo-Keynesian capital-output ratio is the essential reason why Banerji is so interested in uncovering the quantitative, the qualitative and policy dimensions affecting both public and private streams of investment. Of course many scholars have sought an answer to the rather wider issue of India's sluggish macro-economic performance in the last three decades of the 19th century, and Banerji does attempt to address a few of these arguments insofar as they touch upon investment behaviour (pp 276–28). However the reference works are dated (Arthur Lewis and David Landes), and the constraints are familiar – the weak multipliers, the length of the gestation period; the over-elaborate nature of many of the schemes, especially relating to the railways and the canals (though Daniel Thorner's work is not alluded to); the limited state outlays on human capital formation; and the modest levels of agricultural productivity. Rather than pursuing these points in more depth, the author then returns to the theme of policy towards public works. He challenges the scholarly community to test the hypothesis that 'ideological factors' associated with utilitarianism, and the 'cool economic calculus of a foreign government' contributed to policy shifts which militated against greater and more sustained investment in productive assets, especially irrigation.

This provides the necessary link to Chapter Seven which concentrates upon the external sector. Here the accumulated knowledge derived from a life-time career as a distinguished international civil-servant and banker has allowed Banerji to write with authority and strength of purpose. To my mind, the empirical significance of

the outward transfer of factor income and other remittances is demonstrated convincingly. Such transfers, amounting to around 6 per cent of national income, dwarfed inward flows of foreign, overwhelming British, capital, and clearly exerted long term and damaging deflationary effects. As we would expect from Banerji's previous publications, the home charges, i.e., the transfer of funds to London by the sale of council bills, the secular depreciation of silver, the uncertainties of estimating the amount of private investment from domestic sources, bullion movements and the enormous surplus of merchandise trade are brought into the analysis. All this resurrects interest in the old claim of a crippling economic drain, and sceptics such as Kir Chaudhuri and Tapan Mukherjee, and beyond them, Neil Charsworth and James Foreman-Peck, are taken to task for both misunderstanding as well as underestimating the magnitude and scope of "the relentless, swelling stream of transfers" (p 274). A similar charge could be levelled at the *Cambridge Economic History of India, Volume 2* (1983), and even B. R. Tomlinson's *New Cambridge History* (1993), a more recent and open-minded survey of the field, does not properly address this whole thorny issue. Perhaps this is the reason why a disconcertingly large fraction of the references cited by Banerji are contemporary to the period and only a handful of books and journal articles published after 1984 are deemed relevant and worthy of a mention in the Bibliography.

The conclusion does not do justice to the work since it is more a summary and recapitulation of what has gone before than a genuine attempt to provide context and to discuss significance. It is followed by nine quite lengthy Appendices – of which I feel that only the first (on utilitarian principles as applied to public finance), and the third (detailing the accounts of government finance) had any real value. I also found the listing of prime ministers, secretaries of state, governor-generals and viceroys to be a quite unnecessary annoyance. There is also a steady stream of, fortunately minor, printing errors. However, none of this detracts from the overall value of Banerji's efforts, and although the book is unlikely to reverse the low order of priority which public finance now commands on the agenda of academic research, it deserves to be taken very seriously. It is perhaps indicative of the poor state of health of Indian economic history that it has taken a dedicated and talented 'amateur' to enrich our comprehension of the intricate and complex subject matter.

Old and New in Maharashtra Politics

Gopal Guru

Politics in Maharashtra by Usha Thakkar and Mangesh Kulkarni (eds), Himalaya Publishing House, Bombay, 1995; Rs 350.

THERE are various ways to review an edited book, but such a book always poses a serious problem when it operates at various levels. The present book poses such problems. To handle this problem I have decided to look at the book within the context of the following definition of politics, which to some may appear arbitrary.

If politics is defined as the process of creating and counter-creating hegemonic conditions through the complex process of fusion and fission of social forces, then it becomes a little easier to make sense of the striking variations in thematic focus of the articles that have gone into making this particular book. Therefore, with the assistance that one can get from the above definition, it is possible to divide the book in following way. The book contains essays that do not address the complex interplay of political forces that have a bearing on the hegemonic conditions. Instead, most of the essays seek to offer a mechanical account of political development in Maharashtra. Due to their limited focus these essays tend to be descriptive and informative. In this first category are essays by Ram Joshi, Usha Thakkar, Rohini Gawankar, S S Gadkari, Mandalekar, Mukadam, Maneesha Tikekar and Veena Deosthali.

The opening essay by Ram Joshi describes the political development of Maharashtra in terms of the leadership qualities of Yashwantrao Chavan who, according to Joshi, made important contributions to stabilising the Congress rule in Maharashtra. Joshi in his attempt to idealise Chavan, not only sidelines other Congress leaders and subsequent Congress chief ministers, but also attributes philanthropic qualities to Chavan for having brought the dalits into mainstream politics in Maharashtra. Joshi in the same vein seeks to understand the emergence of non-Congress forces in the politics of Maharashtra when a leadership crisis developed within the Congress. While the leadership factor is important in terms of facilitating the stability element in politics, this view does tend to lose sight of other important factors that condition the charter of leadership.

Usha Thakkar traces the leadership qualities of the people's representatives (PRs) in local bodies of Maharashtra. In her useful article dealing with variations in the perception of people's representatives, she

observes that contemporary PRs tend to value 'practical politics' rather than 'idealist politics', which was the major concern of PRs of bygone days. Gawankar deals with the organisational involvement and political orientation of women, both in political parties and in socio-economic groups. She records that, by and large, male-dominated political organisations are not well disposed towards women despite the contribution of the latter to the freedom movement. However, the article fails to show how the ruling parties controlled women through tokenism and successfully subordinated them to the state-mediated patriarchy and overall hegemony of the ruling classes.

Mandalekar's essay forms a useful contribution to the book as it provides detailed information about the structure and functioning of the panchayati raj system in Maharashtra. His emphasis on the 73rd and 74th constitutional amendments makes available information of which many are unaware. The contributions by Gadkari, Kashikar/Deshpande and Veena Deosthali are informative but fail to offer any fresh analysis about the important themes they have handled on politics in Maharashtra. For instance Kashikar/Deshpande's joint paper on the regional imbalances in Maharashtra, instead of discussing its politics, seems to be a memorandum of grievances to be sent to the state government on behalf of the people of Vidarbha, showing how the people of the region feel cheated under the Nagpur agreement and feel deprived compared to western Maharashtra. But the article does not show which are the forces perpetuating the regional imbalances and why certain forces are countering it. What are the hegemonic considerations behind these regional imbalances? What is the political fallout of this neo-colonialism? All such issues which warranted serious academic treatment have been couched in simplistic language.

Maneesha Tikekar's article on dalit politics in Maharashtra, though informative and occasionally critical of dalit parliamentary politics, is loosely organised in terms of academic rigour and logical sequence. It may be that the author was working under the pressure of including too many points which were deemed equally important. In the process, despite the author's serious intention to offer a theoretical grounding to

dalit politics, she appears to be delivering judgments on her subject. Veena Deosthali offers an uncritical account of the success story of judicious water management by certain NGOs in Maharashtra. This account of the voluntary efforts dissolves into a 'more of the same' syndrome, which could have been avoided if a more objective stand had been taken regarding the viability of such projects.

The articles by Joshi and Gadkari are too innocent in terms of the message they convey. For example, Joshi's attempt to attribute benign motives to Y B Chavan for his attempt to bring dalits into mainstream politics of Maharashtra denies the revolutionary political past of dalits and their independent efforts at acquiring autonomous political visibility in state politics. On the contrary, Joshi downplays the aspect of dalit co-option by the Congress. Similarly, Gadkari's otherwise useful article tends to be elitist in its focus when the author laments the lack of representation of teachers, architects, engineers, doctors, businessmen and industrialists in the municipal government. Gadkari considers these sections to be the most enlightened and blames the system of adult franchise for keeping them out of local self-government bodies. Gadkari argues that this system is responsible for electing representatives, the majority of whom are illiterate, and who in the absence

of a good democratic tradition tend to be communal and casteist (p 109). This kind of biased understanding of the democratic system raises serious problems. Gadkari assumes that the elite are beyond petty considerations. If this were the case then how do we understand the nexus between these 'elite' sections and the underworld mafia that dictates terms over life and property of the common man in urban areas.

Rajdeep Sardesai's article on the Shiv Sena has clearly brought out how Vasantrao Naik was responsible for using and aiding the Shiv Sena as a task force to destroy the communist hold over the trade union movement in Bombay. Sardesai has further highlighted how the nexus of the urban elites (as defined by Gadkari) controls the power centres to protect their individual interests rather than those of the urban poor. He also delineates how the Shiv Sena moved from its earlier exclusivist and chauvinistic considerations to the 'all-inclusive' saffron agenda. Sardesai believes that the undiluted regional perspective of the Shiv Sena will remain at loggerheads with its recent 'corporatist' outlook.

Ashok Chousalkar's essay on the politics of the co-operative movement in Maharashtra provides a critical account of the symbiotic relationship between the co-operative institutions and Congress-dominated state politics. However, Chousalkar's understanding of the relationship differs from Baviskar's premise, wherein the latter sees the symbiotic relationship primarily in terms of development politics rather than the politics of mutual manipulation. Second, studies on Maharashtra, including Chousalkar's essay, use the term 'sugar lobby', implying a pressure group role for the sugar bosses. Yet this kind of characterisation attributes a narrow and discrete sense of power to the sugar lords, who otherwise have a hegemonic presence in all the power centres in rural Maharashtra.

The essays by Nawaz Mody, Mangesh Kulkarni and, more particularly, Robert Jenkins, form an interesting part of the book. These three articles try to understand the politics of Maharashtra mainly in the political idiom of voluntary action groups (VAGs). These articles form a unity among themselves inasmuch as they situate the politics of VAGs in the context of a ruling class hegemony that failed to create a healthy civil society. Yet these articles differ from each other in terms of their assessment of VAGs and in academic rigour. Mody's article offers an uncritical account of the role of voluntary groups, while Mangesh Kulkarni's article

does not approve of all the claims made by the VAGs. Kulkarni notices the limitations of these groups in transcending the horizons of the bourgeois order. However, Kulkarni's blanket attribution of emancipatory discourse to AGs is defined primarily from the point of view of the outsider, and overlooks internalities that contest the emancipatory claims of the AGs. First, AG politics assume limited understanding of emancipation based on the politics of local solidarity and sectorial political struggle. This kind of politics does not open up a social corridor for localised consciousness to traverse from the local to the global. This localised consciousness remains tied to local loyalties due to two factors: the competing political activism of the radical forces working in the same place who, instead of engaging collectively in creating the conditions of counter-hegemony, are unfortunately aiming to cut the base of a rival from its own sector. Second, most of the AGs have taken on developmental tasks either independently or with the support of the state. This at least temporarily tends to smother the consciousness of the people who, due to the limited but timely material intervention of the AGs, refuse to see reality beyond their village if not across their region or nation.

Jenkins' article claims that it is an attempt to capture the complex process of building pro-poor political alliances during the difficult time of structural adjustment. Taking a cue from Joan Nelson, Jenkins argues that it is politically possible to shelter the poor from the negative effects of economic reforms by creating mechanisms in the realm of culture as well as in the form of various opportunity structures. The politics of accommodationism was operating before the era of economic reforms basically through four agencies. Jenkins believes that the Employment Guarantee Scheme in Maharashtra is one such mechanism which can accommodate the diverse concerns of the well-off and the poor. The Shetkari Sanghatana is another mechanism which could successfully accommodate the contradictory interests of the two sections. In addition to these, Jenkins also considers co-operative structures as accommodating mechanisms providing democratic space for the least privileged as well as the more privileged.

Jenkins discusses the strategies that can be employed by the poor in order to protect themselves from the current economic reforms in Maharashtra. He considers it important to accommodate the rich farmers who, due to their hold in the rural areas, count much in the electoral politics of the state. Sharad Pawar did exactly this -

accommodating the rich farmers through amending the land legislation so as to suit the interests of not only the rich farmers but also of the foreign investors. Jenkins further argues that though the expenditure on social heads has been drastically reduced in the reform period, the poor need not depend on the technical capacity of the state elites or the government agencies to devise ameliorative programmes. He feels that it is important for the poor to build political alliances around the enduring power of non-economic identities. One such identity is the cultural distance which is the result of the growing common ground between the urban and rural rich, which at the same time deletes the poor from their privileges. However, the author does not offer any illustrations to substantiate his claim.

Jenkins' analysis, though fascinating, does not provide any serious critique of the national and global economy which renews the structure of inequality and exploitation at the regional level. However, he does not seem to be endorsing the new economic policy. He opts for an instrumentalist logic to understand Maharashtra politics, reducing it from proxies to mere skill and strategy. To this extent, not only Jenkins' article but a number of other essays in the book avoid the theoretical issues involved in Maharashtra politics.

Viceroy Reading's 'Offer'

Barmecide's Feast

Anil Nauriya

The 'offer' by Viceroy Reading in 1921 for a round table conference to confer dominion status upon India was in fact a proposal by the moderates within the Congress so as to end their isolation during the non-cooperation movement.

TOWARDS the end of 1921, the Indian non-cooperation movement against the British regime drew to a climax. This coincided with the visit to India of the Prince of Wales who was later briefly to become Edward VIII). As a British civil servant acknowledged, the resistance to the British authority at this time had 'given the English a fright', had been 'unparalleled since the mutiny', incarceration, 'the principal deterrent at the disposal of government, had been made to lose its terrors' and a 'dent had been made in the mystic fabric of British authority' [Moon 1968:113-14]. The fright was understandable. With the October 1921 manifesto prepared by Gandhi and signed also by Maulana Azad, Hakim Ajmal Khan, Jaypat Rai, Abbas Tyabji, Motilal Nehru and several others, the movement had come to acquire a cool clarity of purpose, involving withdrawal of Indians irrespective of religion from civil and military service to the empire.

The mass response to the movement created a crisis for the 'moderate' or liberal school in Indian politics which found itself caught in a bind. The liberals did not wish to disrupt ties with the British. The dilemma became acute on the visit by the Prince of Wales. An effective nationalist boycott of the British royalty entailed a compulsion upon the liberals to take sides and place themselves with the non-cooperators or alternatively, in welcoming the Prince, face national isolation.

Out of this dilemma, which seemed to portend the political supersession of the liberal school in India, was born the so-called Reading 'offer' of December 1921, in relation to which Madan Mohan Malaviya became the principal facilitator. What precisely was this offer and what were the conditions on which it was based? Was it an offer from the then viceroy, Reading, at all? Was it a proposal for a Round Table conference merely to discuss generally the future of India, or did it involve also a promise from Reading that provincial autonomy and dyarchy at the centre (and, according to some versions, even dominion status) would be conceded? If the offer did not originate with Reading, what precisely was his subsequent involvement and objective? Could such concessions have

conceivably been promised at all by the viceroy at the time? Did the liberal school, in promoting the proposal, have any political object *vis-a-vis* the Ali brothers whose political prominence was distasteful to the liberals, and whose political fate was to be given short shrift in most versions of the proposals for calling off the 'hartal'?

Finally, if there was no offer of provincial autonomy and dyarchy at the centre, how has the story survived for nearly 75 years? For, the so-called offer of dyarchy at the centre and even dominion status, from Reading at the time of the visit of the Prince of Wales in 1921, is one of the longest flying kites of modern Indian history. It has been kept alive by certain writers, each relying on the other. Most, though not all, of those who have written on the subject belonged at the time to the liberal school and had close links with it. The Reading offer is part of their mythology.

HM Seervai, writing on the modern period prior to partition in *Constitutional Law of India* (Vol I), does not seem to have scrutinised the veracity of the sources on which he chooses to rely. Errors made by other writers are sometimes reproduced by him, if the erroneous statement fits in with the design of his work. He relies on K M Munshi's observation in 1967:

...had Gandhiji accepted Reading's offer, we might have obtained Dominion Status before 1939 without having had to partition India [Seervai 1991:7].¹

Munshi in his turn has cited in the relevant chapter, and more or less followed, Kanji Dwarkadas whose book had appeared a year earlier in 1966 [Munshi 1967:23]. Munshi, along with the Dwarkadas brothers, had been associated with the Annie Besant school of politics. Kanji Dwarkadas had been a campaigner against non-cooperation.

In Kanji Dwarkadas's 1966 account, his brother Jamnadas and Hridayanath Kunzru were sent to Gandhi by 'Reading, Sapru, Mrs Besant and Malviya' (sic) on December 18, 1921:

with the offer from Reading and Sapru that Lord Reading would call a Round Table Conference in Calcutta a week prior to the Prince's visit... [Kanji 1966:189].

According to Dwarkadas:

Reading promised that at this conference, he would, on behalf of the British government concede full provincial autonomy and discussions would take place as to what powers should be transferred from the Central government to the Indian people's representatives, i.e. dyarchy in the Central government. Ronaldshay in his speech to the Bengal Legislative Council referred to this offer from Reading [Kanji 1966:189].²

That Jamnadas Dwarkadas and H N Kunzru went to see Gandhi, that they did so at the instance of Malaviya and that a proposal for a conference was discussed is not in dispute. However, what role the viceroy played is open to question, though it is probable that by this time he was also in the picture with objectives of his own which were not necessarily consistent with those of the liberals. The suggestion that Jamnadas Dwarkadas and Kunzru had been sent by the viceroy, among others, is made in an account by M R Jayakar, who is apparently taken over later on by Kanji Dwarkadas, who in turn is followed by Munshi. But the account by Jayakar is in fact an almost verbatim repetition of an earlier publication by Kanji Dwarkadas (1950). The two further 'promises' from Reading referred to by Kanji Dwarkadas are not borne out by the record. Jayakar, while referring to the visit to Ahmedabad by Jamnadas Dwarkadas and H N Kunzru, had written:

They were sent at the instance of the Viceroy Sapru and Mrs Besant, to Gandhi at Ahmedabad on December 18, 1921, with the offer that, if the agitation boycotting the visit of the Prince was stopped, the Viceroy would call a Round Table Conference in Calcutta a week prior to the Prince's visit there, at which he himself would represent the British Government and India would be represented by its political leaders, including Gandhi and his Congress friends. *The Viceroy further promised that at this conference, he would on behalf of the British Government, offer full provincial autonomy and discussions would take place as to what powers could be transferred in the Central Government to the Indian people's representatives. In other words, in addition to full provincial autonomy, dyarchy in the central government would be negotiated* [Jayakar 1958:504; emphasis added].

The underlined portion of the so-called offer is borne out neither by the material on Reading nor even by the speech made by Ronaldshay, the then governor of Bengal, cited by Kanji Dwarkadas. Jayakar himself does not appear to have been careful at this point because the passage quoted is virtually a straight lift from a booklet by Kanji Dwarkadas published in 1950. In fact, Kanji Dwarkadas and Seervai have confused the issue. Jayakar had, to his credit, reproduced also a subsequent statement by Madan Mohan

Malaviya to the effect that there was no offer from the viceroy. We shall presently refer to this. Dwarkadas has left out this aspect of the matter from his account. Moreover, Ronaldshay's speech to the Bengal legislative council, made on December 19, 1921, was to the effect that if, to pave the way for a conference, non-cooperation was suspended, he would be 'prepared to suggest' that prosecutions under Part II of the Criminal Law Amendment Act of 1908 (that is the part dealing with 'unlawful associations') would be suspended and 'those charged with offences under this Act should be released' (*Indian Annual Register*, Vol 1, 1922:256-57). (Even this conditional suggestion, therefore, did not cover those arrested on other charges, including the Ali brothers and Saifuddin Kitchlew, on which question much was to turn)

It is this speech, containing a conditional and limited proposal, which is converted by Kanji Dwarkadas not only into a certain offer but also into a corroboration of an 'offer' by Reading on provincial autonomy and dyarchy. Incidentally, when Ronaldshay, as the 2nd Marquess of Zetland, wrote his memoirs (published in 1956) containing several references to his services to India, this particular proposal was not one of the matters mentioned [Ronaldshay 1956; Zetland 1935].

Jayakar had no direct knowledge of the offer. There are certain other aspects of Jayakar's account, which indicate that Jayakar's knowledge about even the Ahmedabad side of these events in December 1921, was, contrary to his occasional claim, not wholly at firsthand. According to Jayakar's narrative, when the message brought by Jamnadas Dwarkadas and Kunzru was in the presence of Jayakar and M A Jinnah given to Gandhi this is what happened:

Gandhi agreed to convey through the emissaries his acceptance of the offer obviously with the view of exploring it. He was later engaged in deep consultations with his followers and Moulvis, at which we were not present, but it was clear that these followers did not like the idea of Gandhi accepting the Viceroy's offer and going to the Round Table Conference. Within one hour, Gandhi wired to Sapru and the Viceroy that, after serious thought, he had decided to reject the Viceroy's offer and the previous acceptance he had sent through Jamnadas and Kunzru was to be treated as cancelled [Jayakar 1958:505 emphasis added]

This part of the narrative is also based on Kanji Dwarkadas's account in 1950. In fact, the portion beginning 'Within one hour' is a verbatim copy from Kanji Dwarkadas's 1950 booklet except that the word 'Viceroy' is used for Reading and 'previous' is inserted before 'acceptance' [Dwarkadas 1950:28]. Dwarkadas is followed also by Munshi (1967:23). No such wires from Gandhi to Sapru and the viceroy are on record and

Jayakar also has not produced them. That no such wires were sent is indicated also by the telegraphic exchange that took place between Gandhi and Jamnadas Dwarkadas on December 21 and December 22, 1921. Jamnadas Dwarkadas himself remonstrates with Gandhi about the latter's telegram to Malaviya and Das (and not about any communication to Sapru or the Viceroy). Jamnadas Dwarkadas to Gandhi (December 21, 1921).

Can you imagine how heart breaking it is for me? Came full of hope only to find that your subsequent telegram to Panditji and Das practically cancelled all you told me. Gandhi to Jamnadas Dwarkadas (December 22, 1921).

My word to you abides. Prepared individually unconditionally attend any conference Viceroy putting you wrong track. Tell me concrete terms to be observed. Only cannot waive voluntary Hartal till terms stated telegram to Das satisfied [Jayakar 1958:507-08].

(The terms in the telegram dated December 19, 1921 to C R Das included the release of the Ali brothers and others who had been arrested for, *inter alia*, asserting at a meeting of the All India Khilafat conference in Karachi that it was un-Islamic to participate in military action against Egypt and the Turks who had done no harm to India. Such prisoners were known as the 'Fitwa Prisoners'. The telegram is reproduced further on in this article)

These facts suggest that Jayakar's account is inaccurate and not consistent even with the texts of such communications as are reproduced by him. Ironically, Jayakar draws pointed attention to such telegraphic exchanges that in fact took place at the time and claims that even these telegrams, reproduced by him, "have remained so long hidden from the general public". This is incorrect. The relevant communications including the two telegrams reproduced above were published in 1928 in Krishnadas's detailed work *Seven Months with Mahatma Gandhi* (1928). But there is no evidence of any wires in December 1921, from Gandhi to Sapru or to the viceroy. Nor is there any evidence of an offer from Reading of the kind suggested by Kanji Dwarkadas.

How did the mythology concerning the Reading offer arise? Towards the end of 1921, the group of 'moderate' leaders led by Madan Mohan Malaviya wanted to make peace between the British and the non-cooperators. The viceroy, who had been anxious that the Prince visit India, found himself in an embarrassing position as a result of the nationalist boycott of the visit. At this juncture, in December 1921, a deputation led by Malaviya wished to call on the viceroy with a suggestion for a Round Table conference. There is little to indicate that the suggestion for such a conference came from the viceroy, it came from the

'moderate' leaders. This group was against mass action at the time. Such action was an embarrassment because it compelled the moderates to take a side. As part of its opposition to the non-cooperation movement, this group circulated that the viceroy had offered dominion status, or something similar, to India. This account the Dwarkadas brothers furthered. Kanji Dwarkadas, in particular, did not confine himself even in 1966 to the limits reached in Jayakar's account. He gave it yet another twist. What Jayakar had contented himself with describing as a proposal for discussion was presented by Dwarkadas in 1966 as a promise. Dwarkadas wrote, now improving on his own 1950 version, that:

full provincial autonomy which was promised to us in January 1922, came to us fifteen years later in 1937, and for the responsibility in the centre which was promised to us then we had to wait for 25 years and that too came by way of division of the country (August 1947) [Dwarkadas 1966:196; emphasis added]

To start with, the underlined portion of these remarks is erroneous. Further, Dwarkadas now shifts ground. The offer is now supposed to have been made in January 1922. This, as showed below, is still more erroneous.

A year and a half after the December 1921 demarche, Madan Mohan Malaviya, who had been in the thick of it, in an interview published in the *Voice of India* (July 4, 1923) said, *inter alia*

But I never received so much as a hint from Lord Reading to start any negotiations for the Round Table Conference or to take any steps to call off the hartal [quoted in Jayakar 1958:516].

This is a contemporaneous account of the events and does not appear to have been challenged by the Dwarkadas brothers in 1923.

All those, especially in Calcutta, who had pegged their earlier understanding of these events on Malaviya's moves in 1921-22 do not seem to have had much to go by. According to Malaviya's press statement issued on June 30, 1923, the proposal had come from an unnamed 'friend' who "suggested the idea of a deputation to the viceroy to urge that a Round Table Conference should be held to discuss the demands of the Congress." [quoted in Krishnadas 1928:156].

Could the viceroy have made, even if he had so wished, the kind of 'offer' that is attributed to him? Reading's biographer, Montgomery-Hyde, speaks the feeling in England about this time was that "constitutional reform in India had gone too far" (1967:369). Only a few months earlier the demand put forward by Srinivas Sastri at the Imperial conference in 1921, for equal citizenship for Indians domiciled in the dominions had engendered opposition

[Jagadisan 1963:71-75]. And Edwin Montagu, the secretary of state in the British government, had to quite shortly after the December 1921 events for granting permission to Reading to publish the latter's telegram to London sent on February 28, 1922 making suggestions on some of the issues agitating opinion in India on the Turkish question and the terms of the treaty of Sevres [Montgomery-Hyde 1967:371-75].

Having failed to wean away Gandhi from the Ali brothers in December 1921, the viceroy nevertheless now wished to placate what he described as 'Moslem India' by seeking to publish his telegram relating to the terms of the treaty of Sevres. Reading explained later to Lloyd George, the British prime minister, "Of course I know that the Greco-Turkish Treaty (of Sevres) was one of international complications." But, he continued:

I was, however, definitely of opinion that having regard to the situation in India, it would be of great value if we could impress upon the Mohammedan population by our action and by publication of the telegram of 28th February that we had done all in our power to present their views as forcibly as possible to His Majesty's Government. Further, we were of opinion if it could be permitted it would be of special importance to publish before the arrest of Gandhi. [Montgomery-Hyde 1967:372]

There are indications that the real attempt of the viceroy, once the 'offer' got going in December 1921, was to drive a wedge between Gandhi and the Ali brothers (on whose release there was no commitment) and thereby seek to alienate, as he saw it, Muslim opinion from the Congress. Reading had, as is to be expected, a predisposition towards such a policy. Earlier, in mid-1921, he had written, as recorded by his son,

He (Mahommed Ali) is the ostensible link between Mahommedan and Hindu. If trouble comes between him and Gandhi, it means the collapse of the bridge over the gulf between Hindu and Mahommedan. [Reading 1945:199]⁴

The story spread in 1922 that C R Das was annoyed with Gandhi for having spurned the viceroy's 'offer'. C R Das was in jail at the time. His knowledge of these December events was based primarily on a couple of visits to him by Malaviya.

However, C R Das's reaction was subsequently written by Subhas Chandra Bose, who also was in prison at the time [Bose 1948].⁵ Maulana Azad, too, was in prison along with C R Das. Azad's reminiscences, as reported after his death by Humayun Kabir in *India Wins Freedom* (referred to hereinafter by us as the Azad-Kabir account) contain a story similar to Bose's. This story hinges, as in the case of Bose, on the impressions then conveyed by Malaviya. As Malaviya himself denies that there was any hint of such an offer from

Reading and since Malaviya's denial was more or less contemporaneous and has not been noticed in either the Azad-Kabir version or by Bose, this removes the substratum on which these accounts are based. However, an examination of these accounts is also instructive. As in Bose's account, there is no suggestion in the Azad-Kabir version of dominion status or of any form of dyarchy at the centre but only of a Round Table conference "to settle the question of India's political future" [quote in Kabir 1959:14-15].

There is one important difference between Bose's account and the Azad-Kabir version. In the latter narrative the government agreed to release the Ali brothers as well for the proposed conference. This, of course, Seervai obliquely repeats by referring to the willingness of Das and Azad to accept the offer, provided all Congress leaders were released "before the Round Table Conference was held" [Seervai 1991:7]. What he does not mention is that Gandhi's query about the date of the conference goes unanswered.

In Bose's account, when Gandhi, in his reply to a telegram from Das and Azad "insisted on the release of the Ali brothers and their associates as a part of the terms of the settlement and also on an announcement regarding the date and composition of the Round Table Conference" the viceroy was "not in a mood for any further parleying and wanted an immediate decision." [Bose 1948:100-01]

According to the Azad-Kabir version, the point at which the viceroy "dropped his proposal" is upon Gandhi's refusal to agree unless political leaders, particularly the Ali brothers, were released unconditionally [Kabir 1959:15]. If the Azad-Kabir version that the government agreed to release the Ali brothers before the Round Table conference is correct, why then should the viceroy have lost interest when Gandhi insisted on their release and a date for the conference?

The viceroy's concern was directed according to the Azad-Kabir version, to avoiding a boycott of the visit of the Prince of Wales to Calcutta. This visit was in late December 1921. Well before the visit, Gandhi had on December 19, 1921 wired C R Das and Azad as follows:

Composition/date Conference should be previously determined. Release should include prisoners convicted for Farwas including Karachi ones. Subject to these conditions in addition to yours we can, in my opinion, waive Hartal. [Government of India nd:55]

This was before the Malaviya deputation waited upon the viceroy on December 21, 1921, and also before the Prince's visit to Calcutta. Therefore, the reason given in the Azad-Kabir account for the 'dropping' of the supposed proposal from the viceroy is not quite correct and misses the point. The viceroy ceased to evince any interest after

the Prince's departure. But did he have any real interest in the proposal itself even prior to the visit? For, Gandhi's telegrams to Malaviya and to C R Das and Azad were dated December 19, 1921, that is before the Prince's visit. It is on this aspect of the Azad-Kabir version that Seervai has however, independently suggesting that the viceroy lost interest after the Prince's departure [Seervai 1991:7].

To conclude this part of the story, there was no offer from the viceroy either about dominion status or about any form of dyarchy at the centre. In December 1921, there was no 'offer' from him about a Round Table conference either: this was a proposal by the moderate group. The viceroy simply did not discourage efforts for such a conference as the report prepared under the Government of India Act for presentation to the British parliament put it at the time [Rushbrook 1985:93]. If the fact of the Prince having come and gone in December 1921, is given as the reason for viceregal lack of enthusiasm this does not explain the 'loss of interest' on the viceroy's part even before the Prince's visit. Evidently, the viceroy had simply pursued a strategy of ambiguity with Malaviya's deputation, in the belief that the hartal might be called off on the basis of airy hopes that the deputation itself had nursed of a future Round Table conference and with the isolation of the Ali brothers as an added bonus. Reading was not prepared to be pinned down to a specific proposal. Nor does he appear to have had any authority from the British government to make political 'offers' to India. In fact, there are clear indications to the contrary. The participants in these events do not appear to have known that a meeting of senior ministers of the British cabinet in London on December 20, 1921 had not been enthusiastic about the idea of a conference and had declined to agree to a withdrawal of penal measures or to 'sanction any change in the Constitution of India' [quoted in Nanda 1969:33]. Reading does not appear to have let them know this. Significantly, one hint was finally called after Gandhi's telegram to Jaganadas Dwarkadas on December 22, 1921, saying, *inter alia*, "Tell me concrete terms to be observed." [Dayakar 1958:508; Krishnadas 1928:128]. But the story, like the smile of the Cheshire cat, remained.

There was a sequel to these events. A conference of leaders was held at Bombay in January 1922 (sometimes referred to as 'Malaviya conference' and even as a Round Table conference, although the object of the Malaviya conference itself was to persuade the government to call a Round Table conference). The conference served as a repetitive act of the events enacted in December 1921. Seervai refers to the Azad-Kabir account and with regard to the January 1922 conference states that this was called

by Gandhi [Seervai 1991:7; Kabir 1959:20-21]. This is incorrect. The January conference was called by the Malaviya-Jinnah group which, along with Jayakar and Jamnadas Dwarkadas, had earlier floated the Round Table conference idea. Incidentally, the invitation sent for the conference is signed by Malaviya, Jinnah, Jayakar and four others [Pirzada 1977:36-37; Jayakar 1958:519-20].¹ Gandhi participated in his individual capacity in the January 1922 conference as a 'non-cooperator'. Even at the January 1922 conference the organisers showed little anxiety on the release of the Ali brothers and this was a serious point of difference between them and Gandhi [Krishnadas 1928:263-64, 267-68].

At the January 1922 conference, Jinnah himself, while functioning as one of its secretaries was sceptical of the so-called 'offer'. He, therefore, remarked at the Bombay meeting that "... there could be no conference until the Viceroy gave an assurance that he had the sanction of the British government behind him for carrying into effect whatever decision might be reached by the suggested conference" (*The Indian Annual Register*, Vol I, 1922: 277).

The British official position with regard to the events in December 1921, and January 1922, is set out in the report prepared for presentation to the British parliament in accordance with the Government of India Act. The report states in regard to the 'Round Table Project', that when some of:

the Moderates displayed a great anxiety to arrange a compromise by means of a Round Table Conference, Lord Reading did indeed make plain the fact that nothing could be done until the non-cooperation party discontinued open breaches of the law, and the practice of intimidation: but he did not discourage efforts which were so plainly well-intentioned [Rushbrook 1985:93-94].

This is consistent with Malaviya's own statement made a year and half later, which has already been referred to above. An indication of the British position can also be found in the fact that when on January 18, 1922, Pheroz Sethna moved a resolution in the Council of State at Delhi that an "informal joint sitting of both the houses of the legislature" be convened "to settle on what lines a Round Table conference of all party leaders should be held", this was opposed on behalf of the government, voted upon and 'declared lost' (*The Indian Annual Register*, Vol II, 1922-23: 528xx-528xxi). Consequently, it appears that many of the academic narratives of these events currently in circulation are also based on incorrect premises.²

Notes

¹ The relevant portion has been published separately as *Partition of India* (1994:14). Seervai cites from Munshi (1967). Stanley Wolpert (1985) also swallows the story, writing of "that remarkable Viceregal offer" and going

to the extent of saying that had Gandhi "adhered to his initial response, the transfer of power from Imperial British to national Indian control might have been advanced a full decade and a half" (1985:75). Wolpert cites Jayakar (1958).

- ² The substance of this passage occurs also in the same writer's *Ruttie Jinnah* published by himself from Bombay (1963?), p 15.
- ³ Out of the proposals put by him before C R Das and Azad in prison, Malaviya adds in the press note that: "They were proposals put by me before the viceroy in consultation with some friends, which the government was willing to entertain and agree to" [Krishnadas 1928:158]. The reference to the government's willingness to agree is in relation to proposals embodied in C R Das and Azad's telegram of December 19 to Gandhi regarding the conference proposal along with release of those arrested as a result of orders passed under the Criminal Law Amendment Act but not of other non-cooperators. Further, this did not concern provincial autonomy or dyarchy at the centre.
- ⁴ Division was, in fact, the basis of Reading's conscious strategy from the very beginning, not real dialogue. On his arrival in India in April 1921, there were suggestions both in India and England for a Round Table conference. "But", his son records, "Lord Reading set his face against all such hints and proposals and not only declared his intention of refusing to take the initiative in summoning such a conference but also of rejecting the proposal if made by anybody else" (1945:193).
- ⁵ Bose was arrested on December 10, 1921, and remained in prison till August 9, 1922 [see Basak 1977:9]. His sources of information at this time suffered from the same disadvantages as did those of C R Das and others in prison at this time.
- ⁶ An amusing version of this episode which spread in political circles was that the talks failed "owing to a slight mischance in that Gandhi's telegram reached Lord Reading in Calcutta a little late..." See B Pattabhi Sitaramayya's contribution in S Radhakrishnan (ed) (1944). There was no such telegram to Reading. Besides, a glance through the *Transfer of Power Documents* published by the British government in regard to its last days in India would reveal that the viceroys often received letters long before the addressees. That the British government would have missed out on any of Gandhi's telegrams to various persons at this time strains credulity. If, on the other hand, it is implied that any telegram was despatched late, this is belied by the dates of the communications exchanged. Incidentally, according to Malaviya's press note of June 30, 1923 [quoted in Krishnadas 1928:169] what in fact reached late was a telegram sent on December 21, 1921 by Gandhi to Shyama Sunder Chakravarty who succeeded C R Das as the president of the Bengal provincial congress committee. In the *Collected Works of Mahatma Gandhi* (Vol 22, p 60) this telegram is published with the note 'on or after December 21, 1921'. This too seems to have reached early enough to enable Malaviya and Chakravarty to meet the viceroy again on this basis, on December 22, with the suggestion that the conference be called on February 15, 1922, and that the Ali brothers be invited. In Malaviya's words, he placed the proposals before the viceroy "on the 22nd December (1921). But he said that it was too late to consider them. The members of his government had left Calcutta and the matter had been dropped". This 'too late' theory occurs also

in Bose (1948:101). Neither Malaviya nor Bose takes note of the fact that the Prince of Wales was yet to enter Calcutta. He was due on December 24, 1921.

- ⁷ Pirzada (1977) does not have the name of K Natarajan which is mentioned by Jayakar (1958). The latter claims that the conference was conceived by himself and Jinnah (1958:517).
- ⁸ For example, Brown comments: "A conference called by Malaviya, Jinnah, M R Jayakar and others proved abortive because Gandhi would not give up civil disobedience" (1972:348n). This reasoning, incidentally, seems incorrect not merely in the light of our discussion of the illusory nature of the so-called 'offer'. In addition, Brown goes further than the mainstream contemporary imperial tradition. For, the account by the Second Marquess of Reading had attributed to Gandhi merely the desire to continue preparation for civil disobedience while the conference was in progress [Reading 1945:243].

Muslim Intellectuals, Institutions, and the Post-Colonial Predicament

Mushirul Hasan

Much research on Muslims since independence is still conducted within the framework bequeathed by the British and some nationalist writers. It is assumed that orthodoxy represents true Islam and that liberal currents are secondary. Much more research is needed on 'heterodox' trends, to discover schools of thought among Muslims that placed Indian Islam in its specific Indian environment. This study of the debates that took place, especially in and around Jamia Millia Islamia and Aligarh Muslim University, in the post-independence period, is a step in this direction.

I

MUCH research on Muslims since independence is still conducted within the framework bequeathed by the British and some nationalist writers. The categories used to define them have been questioned but not changed. There is still talk of a 'Muslim mind', a 'Muslim outlook', and an inclination to construct a 'Muslim identity' around Islam. A sense of otherness is conveyed in such images. Muslims are made to appear different in the print media, in some literary works, and in the world of cinema. In this respect, there is often a striking convergence between the 'secular' and the 'communal' perspectives.

It is also assumed that orthodoxy represents true Islam and the interests of its adherents; and that liberal and modernist currents are secondary or peripheral to the more dominant 'separatist', 'communal' and 'neo-fundamentalist' paradigms. It is time to underline, along with the 'dominant' orthodox paradigms, the 'heterodox' trends which contest the definition of 'Muslim identity' in purely religious terms, and to refute the popular notion that Islamic values and symbols provide a key to the understanding of the 'Muslim world view'.

Much is made of the fact that Muslims, more than any other religious entity, attached greater importance and value to their religio-cultural habits and institutions; hence they were more prone to being swayed by religious/Islamic rhetoric. There is irrefutable evidence to substantiate this view. But if the inferences drawn are specific to a community, what does one make of 19th century religio-revival movements in Bengal, Maharashtra and Punjab, and their deepening anxieties over the future of, and the evangelical threat to, the Hindu identity? At the heart of the Arya Samaj's brand of reconstruction and reform was the restoration of the pristine purity of vedic culture and civilisation. The 'Tilak school'

in Maharashtra and the leading architects of the Swadeshi Movement in Bengal, including Aurobindo Ghose and B C Pal, were constructively rethinking their 'Hindu' heritage and meeting the challenges of modern thought by assimilative-creative processes. The cow question was nothing but an evocative symbol of Hindu resurgence in northern and western India. The crusade for Hindi in opposition to Urdu was as much linked with government employment as with a widely perceived symbol of a Hinduised identity. Finally, the emergent national consciousness appropriated the orientalist construction of Hinduism, as well as what it regarded as the heritage of Hindu culture. The need for formulating a Hindu community also became a requirement for political mobilisation when representation by the religious community gave access to political power and economic resources.

It must be borne in mind that a Muslim, like his counterpart in any other community, has many diverse roles to play. He is not cast in the role of a religious crusader or a relentless defender of the faith. Besides being a follower of Islam by birth and training, a Muslim, and for that matter a Hindu or a Sikh, is a peasant or a landlord, an agricultural worker or a landless labourer, a worker or an industrialist, a student or a teacher, a litigant or a lawyer, a Shia or a Sunni, a Deobandi or a Barelwi. Should we then harp on his Muslim/Islamic identity to the exclusion of everything else, including the secular terms in which he relates to the more immediate socio-economic needs and his wide-ranging interactions with his class and not just his Muslim brethren? The depth and nature of this interaction is a matter of dispute; but does that justify a discussion in terms of an absolute Muslim/Islamic consciousness? If centuries of shared experiences could not create composite solidarities, how could a specifically Muslim self-consciousness emerge out of their diverse experiences?

Mohammad Ali Jinnah believed he had all the answers. So did the Jamaat-i Islami. But there were other explanations as well, boldly constructed around secular and pluralist conceptions and counterposed to an essentialist view of Indian Islam. Scholars, artists and creative writers, in particular, continued to contest the two-nation theory, and unfolded the past to discover elements of unity, cohesion and integration and to provide historical legitimation for multiculturalism and religious plurality. Prominent amongst them were people with pronounced socialist and Marxist leanings.

Muslim intellectuals, both independently and as part of liberal-left formations, were doing much the same. Acting not as Muslim intellectuals *per se*, they nevertheless saw themselves as transmitters of a certain historical tradition. They carried forward the inconclusive debates of the post-1857 decades, when the 'ulama' and the liberal intelligentsia were constrained to sketch out a role for themselves – within a religious tradition that had strong revivalist precedents as well as liberal and reformist tendencies. They did so because certain key aspects in those debates bore contemporary relevance and related to how Muslims situated themselves in a world that was brutally shattered by partition. The nature of this engagement in post-independence India is the central theme of this discussion, though it is mainly confined to the realm of ideas mirrored through Jamia Millia Islamia and Aligarh Muslim University.

II

The 19th century, commented Maulana Abul Kalam Azad, "marked a spirit of renaissance for the Indian spirit, and Aligarh was one of the centres of such renaissance". Zakir Husain, author of the Wardha scheme of education and Aligarh's vice-chancellor, told Nehru on his visit to the campus in November 1955 that "the way Aligarh works,

the way Aligarh thinks, the contribution Aligarh makes to Indian life... will largely determine the place Muslims will occupy in the pattern of Indian life". Such magisterial generalisations do not stand the test of historical scrutiny; but they certainly offer a clue to the role assigned to this university in the Muslim intellectual resurgence. It is appropriate to concentrate on the main reformist strands in the last quarter of the 19th century, a phase dominated by the ideas of Syed Ahmad Khan and the 'Aligarh movement'.

The post-mutiny era witnessed two kinds of reactions: a traditionalist backlash which was sometimes militant but more often muted, and a 'modernist' response typified in the 'Delhi school' and the 'Aligarh movement'. There were first and foremost those who, in the footsteps of Shah Waliullah, attributed the political, social and moral decline of the 'faithful' to Hindu and Shia accretions, to their straying from the straight path of Islam. The future of Muslims and of Islam was in jeopardy because the western concept of life, with its excessive individualism and materialism, constituted the very antithesis of the basic values of life as formulated by the Quran. That was the message from the 'mujahidin' in the north-west frontier region and the farazis in rural Bengal. They argued, just as their counterparts did in Egypt, Sudan and Turkey, that a programme of religious purification, together with religious education and 'Islamic conscientisation' in the form of publications, was an alternative to the 'degenerating' western ideologies which had placed the 'umma' in its gravest crises.

Some of their ideas, though fairly worn-out, went down well in north India and Bengal, where British rule had disturbed the status quo most of all. Their protagonists secured a following in rural Punjab and Bengal through established networks of mosques, 'dargahs' and 'madrasas'. Yet neither the mujahidin nor the farazis could generate a countrywide movement comparable to, say, the khilafat campaign in the 1920s. The social equilibrium was disturbed in some areas, but not everywhere. Islamic revival became an obsession with some, but not all. The message from Deoband's Dar al-ulum reached far and wide; yet not many, so lamented the high priests at this major site of Islamic revival, lived their lives in accordance with their 'fatwa'. The colonial government, especially after 1857, thwarted the orthodox challenge through conciliation and compromise and a policy of balance and rule between what they conceived as the two great communities, the Hindu and the Muslim.

The upsurge in 1857 offered a rallying point to the disgruntled elements in the ruling and service classes, but the banner of revolt

was not raised everywhere. In most areas, Muslims seemed inclined, from the days of Company rule, to arrive at a workable *modus vivendi* with their new rulers and to carve out new channels of aspiration and of spiritual creativity. Having read the writing on the wall, they accepted British rule much more gladly than others. There were no doubt a few hard nuts to crack; but most were not repelled by, but attracted towards, the west, because they found, as did Mirza Abu Talib and Lutfullah during their stay in England, a stable political system, an affluent industrialised economy, and a civilisation with a strong material and cultural foundation.

In Delhi College, subsidised by the British since 1827 and always headed by a British principal, there was much creative thinking and many systematic endeavours to demonstrate Islam's compatibility with western thought and values. In the presidency towns, Abdul Latif and Ameer Ali in Calcutta, and the Tyabji family in Bombay, set the tone. Tyab Ali, head of the Tyabji family, was the first Muslim to send his sons abroad for education, and the first ladies of the Tyabji-Fyzee family left 'purdah' in 1894. His son, Badruddin Tyabji, was the first Indian barrister in Bombay, the first Indian judge on the original side of the Bombay High Court, and the first Indian to act as chief justice of the Bombay High Court.

Rapprochement with the British, the guiding principle of most Muslim reformers, went along with much soul-searching and introspection. Newly-founded organisations such as the Anjuman-i Himayat-i Islam in Punjab, the All-India Muslim Educational Conference, and the Anjuman-i Islam in Bombay began to wonder why Muslims were not able to integrate their system of education, family structures, economic enterprises and even political aspirations into the 'national mainstream'. Why the resistance to change and innovation? What were the deeper causes of the social malaise? What was the remedy? Thus Hali devoted his *Majlis annisa* to the plight of Muslim women. Syed Mumtaz Ali commented on polygamy, the age of marriage, purdah and the empowerment of Muslim women. Nazir Ahmad, a civil servant, set a model for writers in the *Mirat al-urus* (The Bride's Mirror), detailing the evils of polygamy and the virtues of women education and widow remarriage.

Justice Shah Din in Punjab advocated specialised training for Muslim girls, if not in scholarly pursuits then at least in the basic skills of reading, writing, arithmetic, hygiene and home economics. He was the first president of the Muhammadan Educational Conference in 1894, and he and Mohammad Shafi were the first Muslims to send their daughters to study

at Queen's Mary College in Lahore. In Bombay, Badruddin Tyabji helped found and then ran for many years an educational foundation. The major focus of his career was the education of Muslim boys, along with other social reform measures like the removal of purdah and getting the Age of Consent Bill passed in the teeth of both Hindu and Muslim opposition. At the Muhammadan Educational Conference in 1903, he pleaded for the abandonment of the purdah system and for a liberal education for Muslim women.

During most of his adult life, Hakim Ajmal Khan, a senior and venerable citizen of Delhi, wore the sherwani and Turkish fez the former an adaptation of the western coat and the latter a symbol of admiration for Ottoman social change. His lifelong friend and comrade, M A Ansari, witnessed the impact of the Young Turk Revolution, led by the Committee of Union and Progress, and was vastly impressed by the strength and vitality of the modernising forces in Turkey. Others were equally impressed that Turkey was on the move, competing with the west for an equal status in the comity of modern nations. This led Iqbal, who was among the few Muslim intellectuals in India to welcome the abolition of the khilafat, to comment: "If the renaissance of Islam is a fact, and I believe it is a fact, we too one day, like the Turks, will have to re-evaluate our intellectual inheritance".

Syed Ahmad was of course the trailblazer. He alone possessed the intellectual resources to reconcile matters of faith with the more immediate task of rescuing Muslims from their downward spiral. He set high value on the social morality of Islam and justified the adoption of western ideas and institutions in Islamic terms. It was not necessary to imitate the west but only to accept some of its values as, at least, a second-best substitute for vanished Muslim glories.

With his sharp analytical mind and his acute sense of the working of historical forces in the shaping of contemporary societies, the Aligarh reformer was able to recognise change, flux and movement in history. He knew his Islamic history well. He knew his Islam better. He could thus comprehend the scale and depth of reformist ideas and currents, identify elements of change and innovation, and discover a sound theoretical basis for a constructive dialogue and interaction with the west. The conclusions drawn by him and the message communicated were directed against ill-founded assumptions about the west and ill-informed criticism of his own project by the theologians. He describes in his letter to Nawab Mohsinul Mulk, his esteemed colleague at Aligarh, how he became concerned after the mutiny for the reform of his community, which he saw to be

impossible apart from their education in the modern sciences and in the English language.

Despairing of existing commentaries with their preoccupation with trivia, he "deliberated on the Quran itself and tried to understand from the Quran itself the principles on which its composition is based". He found that if the Quranic principles were adopted there would remain no incompatibility between the modern sciences and Islam. He tried to resolve the difficulties inherent in the four traditional sources of Muslim law by a dialectical rationalist exegesis of the Quran; by scrutinising the classical data of the 'hadith'; by an almost unlimited emphasis on 'ijtihad' as the inalienable right of every individual Muslim; and finally by rejecting the principle of 'ijma' (consensus) in the classical sense which confined it to the ulama.

There was strong resistance to and criticism of Syed Ahmad from identifiable quarters. But in the long run, his modernist agenda was acclaimed and endorsed by a new generation of Muslims, many of whom were alienated by the formalism of the traditional theologians. They were, moreover, convinced that the pursuit of modern education and the raising of intellectual standards would not undermine but only vindicate the message of Islam. His reformulation of doctrine in modern instead of medieval terms, as also his eclectic world-view, became part of the furnishing of mind of educated Muslims. He inspired some to set up educational centres modelled on the Aligarh College. Thus a Madrasatul-Islam in Sind and Dacca College were set up, the latter gaining, like Aligarh, university status after first world war. Following the Muhammadan Educational Conference held at Madras in 1901, the Muslim Educational Association of south India was founded.

In his *Preparatory Years*, Syed Ahmad unveiled to the young Azad the true spirit of the Quran and the genuine teachings of Islam. The Maulana compared him with Raja Rammohun Roy, both of whom left the stamp of their personality in all spheres of intellectual activity, and emphasised that the Syed, who used the metaphor that Hindus and Muslims were the two eyes in Mother India's face, was a believer in inter-community harmony. He, the presiding spirit of the university, represented the forces of change by challenging traditional values and outmoded beliefs. "The battle was fought here in Aligarh and Aligarh is the visible embodiment of the victory of the forces of progress." Iqbal, too, described Syed Ahmad as "the first modern Muslim to catch a glimpse of the positive character of the age that was coming" and "the first Indian Muslim who felt the need for a fresh orientation of Islam and worked for it".

III

In the early 20th century, the political landscape underwent a change in response to major national and transnational developments. A closing-up of the ideological split between the ulama and the liberal intelligentsia, and a gradual re-assimilation of traditional and western values, were the immediate consequences. Deoband's Dar al-ulum and the Aligarh college were no longer arrayed against each other; in fact, vocal sections at both places dialogued to bridge the gulf and narrow their differences. This was not on account of any basic ideological compatibility or sudden meeting of minds on matters of faith and dogma. It was because more and more Muslim divines, especially from Deoband and Nadwa, and the men of 'New Light' discovered, as in the case of the Mussalman Waqf Validating Act of 1913, new areas of co-operation. Yet what engaged them most and spurred the efforts at unity were not just legal, educational or religious matters, but their place in the political arrangements that were being hammered out in Delhi and Whitehall. Their main preoccupation, if not the sole concern, was to define the community afresh in order to suit their godly as well as the more attractive temporal interests. Their spirited endeavour, for which they revitalised an otherwise defunct Muslim League, was to locate the wider communitarian concerns outside the framework of Congress nationalism.

Once the ulama and their erstwhile *bele noire*, the western-trained professional politicians, put their heads together, they came up with definition which was developed in the context of colonial institutions and their own scripturalist rhetoric. This definition sought to create a corporate identity and set Muslims apart from their own class, region and linguistic unit. An Islamicate identity was thrust on Muslims, many of whom were not accustomed to living in accordance with the shariat or the diktat of the theologians. In the end, the coming together of the men of religion and the modern-day publicists backfired – insofar as it aided the cause of 'Muslim nationalism' and stifled liberal, reformist and secularising trends. This was a cause of celebration in some quarters; but not everyone had reasons to rejoice over this ominous development in 'Indo-Muslim' history. The worrying thought was that the contours of the community were being delineated in complete disregard of, and with no reference to, its local, regional, class, caste or linguistic specificities.

What did the enumerators find when the first all-India census was tabulated and analysed in 1881? They found that Muslims numbered but 19.7 per cent of the population.

They uncovered a geographically-dispersed aggregate of Muslims, forming neither a collectivity nor a distinct society for any purpose, political, economic and social. They found Muslims whose religious rituals had a very strong tinge of Hinduism, and who retained caste and observed Hindu festivals and ceremonies. In the Bengal countryside, in particular, pre-Islamic ceremonies relating to birth, marriage and death continued to be observed. In fact, the entry of Muslims in south Asia by so many and separated doorways, their spread over the subcontinent by so many different routes, over a period of centuries, and the diffusion of Islam in different forms from one area to another, ensured that this religion would present itself in many different epiphanies seen from different angles. Neither to its own adherents nor to non-Muslims did Islam seem monochromatic, monolithic or indeed monolithic. Yet, by the close of the 19th century, the community, separate and distinct from the 'others', had arrived with its accompanying baggage of concepts which bore no relationship with the ground realities.

This is where the Simla deputation of October 1, 1906 and the viceroy's response to the 'command performance' appears to be a significant landmark. From now on the Muslim elites and their spokesmen knew where their priorities lay, and to whom to turn for political legitimisation. They had a three-fold project: to trace the historical evolution of an imaginary community, as an antithesis to the Congress theory of 'unity in diversity'; to emphasise the distinct identity and separateness of this community in order to bargain and extract concessions from the government; and to invoke Islamic symbols of unity to mount a movement that would, in its essential thrust delink specific 'Muslim aspirations' from the broader concerns of the countrywide nationalist struggle. This is how Muslim nationalism gained legitimacy in government eyes. This is why it appealed to the landed and the urban-based professional classes, who were apprehensive of their position in the newly-created power structures. Every single step towards the devolution of authority to Indian hands was accompanied with initiatives to cement bonds of religious solidarity, on the one hand, and exacerbate inter-community differences, on the other.

The British had no reason to challenge sectarian nationalism so long as it could be pressed into service to counter nationalist aspirations. Having already created a Muslim identity in Indian politics, they could draw comfort from Jinnah repeating, at the height of the Muslim League movement, much the same arguments that had prompted Morley, Minto, Montagu and Chelmsford to concede to the Muslims separate electorates, weightages and reservations in the councils

and public services. During second world war, Jinnah could play any tune he liked. Officials in Delhi were prepared to give him a patient and sympathetic hearing and support his Pakistan project. He emerged stronger once the guns were silent on all fronts and the allies had extracted their pound of flesh from Germany. The British government felt obliged to reward him for dutifully supporting the war effort.

While these games were being played out on the Indian turf with utmost cynicism and insensitivity, a fair number of Muslim-dominated organisations and institutions sensed the dreadful consequences of political solidarity being built on religious ties. They questioned the conviction or myth in certain Muslim circles that the future of Islam in south Asia was endangered by Hindu nationalism, they disputed the notion of a monolithic and homogenised community, and they challenged the constitutional arrangements that lay the seeds of discord and disunity. Many people wrote and spoke from these perspectives about composite living and plural nationhood. Many were moved by a high sense of idealism and worked for inter-community unity and harmony. Their banners and flags did not flutter on house-tops. Their audiences or readership did not run into thousands, but this did not deter them from making their point of view known. They were men of conviction and envisaged, even when Pakistan's creation was imminent, a future that held out hopes for the beleaguered Muslims in India. Their optimism was summed up in the narrative as well as the title of Tufail Ahmad Manglori's book *Mussalmanon ka Raushan Mustaqbil* (A Bright Future for the Muslims), and in the reflections of others who, after independence and partition, renewed their intellectual quest and commented on their history and 'destiny' with poise, dignity and self-confidence.

IV

The Jamia Millia Islamia (National Muslim University) in Delhi was, in the words of Nehru, "a lusty child of the non-cooperation movement" and a living symbol of a modest but significant endeavour to experiment with the underpinnings of multi-culturalism. It encapsulated two dominant trends, each finding several points of convergence in the post-khilafat era: the reformist inclination of some ulama who, like Maulana Mahmud Hasan of Deoband, were also profoundly anti-British, and the political radicalism of Aligarh-based students who rejected their institution's pro-British proclivities and gravitated towards Gandhi and Nehru for political leadership. The Turkish author, Halide Edib, found the Jamia to be much nearer to the Gandhian movement than any

other Muslim institution. It seemed, in its political aspect, 'like an attempt to understand the inalienable democracy of Islam as it was in the earlier Islamic society'. Sturdy Congressmen could thus mingle with ardent socialists and fiery Communists and individually and collectively fashion a composite and secular ethos – hence the League's criticism of Jamia's nationalist complexion.

Whether others agreed or not, the Jamia 'biradari' at Okhla in south Delhi was convinced of its quintessential role as a nationalist institution, devoted to the service of the nation and destined to contribute to the shaping of modern India. Though founded by Muslims, it was Muslim only in name. The atmosphere was mixed and cosmopolitan, thanks to the presence of several Hindu and Christian teachers, including a few from Germany, a country where some of Jamia's founders learnt their first lessons to develop their antipathy towards British colonialism. The theological disputations between the bareilwis and the deobandis, and the doctrinal differences between the shia and sunnis, which marred campus life in Aligarh, were alien to Jamia's culture, where no one wished to serve as a proper example of religiosity.

Jamia's social and intellectual manifesto was the outcome of enlightened political and intellectual currents sweeping across the country. Its educational programmes, embodied in the Wardha scheme of education, bore the imprint of Gandhi's ideas on primary education and incorporated some of Tagore's innovations at Vishwa Bharati in Shantiniketan. Its liberal orientation owed much to Syed Ahmad who, according to Mohammad Mujeeb, "had a larger view of life than any of the purely religious leaders, and one must be grateful to him for having given commonsense its rightful place in religious thought". Its own reconstruction of the Islamic ideal of an active political life was inspired by Azad, whose neo-intellectual modernism, religious universalism and commitment to composite Indian nationalism, represented the essence of what the Jamia stood for. Zakir Husain, vice-chancellor from 1926 to 1948, recalled:

When I was a boy I was anxious to light the dusty lamp of my life, and like other people, I too had prepared the cotton wicks and had put them in the oil of my soul, and was roaming about to find out from where I could ignite them. The first wick of that soul, the first wick of the lamp, I lit from the lamp of the Maulana. As a student I used to read *Al-Hilal*, and when I read it in the company of my friends, it was at that time that this wick got the fire. Although I have ignited myself from other sources as well, but I do confess today that the first ignition had taken place only from him.

The Jamia fraternity was dumbfounded by the rhetoric of the Muslim League. Iqbal's plea for a Muslim state in north-western India was against their cherished ideal that Muslims must live and work with non-Muslims for realising common ideals of citizenship and culture. Mujeeb, the vice-chancellor, said so to the poet when he visited the campus early in 1935 to preside over Halide Edib's lecture. The two-nation theory was anathema to an institution whose sole *raison d'être* was to promote cultural integration, foster composite and syncretic values, and cement bonds of inter-community friendship and understanding. As the first 'Amir-i Jamia' (chancellor), Hakim Ajmal Khan expected the students to know each other's culture: "the firm foundation of a united Indian nationhood depends on this mutual understanding". M A Ansari, who cursed Jamia when it was threatened with closure, did not believe in a politically separate Muslim community. He often said that future India must be a field of co-operation between men of different faiths. Writing to Halide Edib, who was Ansari's guest in Jamia, the chancellor observed: "I consider the brotherhood of man as the only real tie, and patriotism based on race and colour are, to my mind, artificial and arbitrary, leading to division and factious fights".

Jinnah's political agenda in the 1940s ran contrary to the Ajmal-Ansari project. There were other huge differences as well. The Jamia biradari lionised Gandhi, their chief benefactor, and admired Nehru's intellect, broad vision and progressivism. They were regarded as models of impeccable political conduct. The more devoted, Shafiqur Rahman Kidwai being one of them, took to wearing khaddar and the 'Gandhi topi' and participated in civil disobedience campaigns. Jinnah and his colleagues were, on the other hand, highly critical of Gandhi, Nehru and the Congress brand of nationalism. Not surprisingly, they fired their salvo against Ansari and Zakir Husain, chided them for turning the institution into a 'Hindu stronghold' and criticised the syllabi which cultivated patriotism at the exclusion of Islamic worship. Jamia's ethos and orientation, stated a well-publicised letter, was prejudicial to Islam.

An institution with a secular and nationalist record, testified to by 'A Muslim', could not escape the fury of the angry mobs that struck terror in Delhi during the communal holocaust in August-September 1947. Jamia's property at Karol Bagh in old Delhi, where the institution was first headquartered after its brief and lazy existence in Aligarh from 1920 to 1925, was looted and destroyed. The vice-chancellor, Zakir Husain, ran for his life and escaped miraculously. The husband of Anis Kidwai, a friend of Jamia, was killed. There were other tragedies as

well, but Jamia lived through such harrowing experiences to provide the healing touch. Amidst incredible savagery, dedicated teachers and students were, in the words of Gandhi, "like an oasis in the Sahara" Nehru commented.

few institutions succeed in retaining for long the impress of the ideal that gave them birth. They tend to become humdrum affairs, perhaps a little more efficient, but without the enthusiasm that gives life. The Jamia, more I think than any other institution that I can think of, retained some of the old inspiration and enthusiasm.

The university, in its search for moral and political support after independence, could have turned into a quasi-religious or quasi-communal institution. But this did not happen. It remained, and rightly projected itself as, secular and nationalist to the core. Wedded to the values of liberal humanism, it allowed no space to religious intolerance and communal allegiances. "I look on this", claimed Mujeeb proudly, "as a secular school". Such traditions were exemplified in the writings of Mohammad Mujeeb and Syed Abid Husain, both connected with Jamia since 1925-26.

In his *magnum opus* published in 1966, Mohammad Mujeeb, the Oxford-educated Jamia vice-chancellor, identified various constituent elements of Indian Muslim religious, political and social life, revealed some of its essential qualities, and questioned "the fallacies and illusions that arise out of an identification of the whole... community with some element of its belief or practice, with some political figures or military or political achievements, with particular social forms and patterns of behaviour, with some historical tendency". He brought to light a fact that is now adequately known through perceptive historical and sociological studies: the diversity of beliefs, the variety of social forms and the multiplicity of ideas and movements among Muslims. The only common factor, he argued, was common allegiance to Islam; though it was easy to confuse the Islamic identity of the Muslims as a distinct body politic, as a nation, which they never were and never wanted to be. He questioned the ways in which educated Muslims saw themselves, arguing that their judgments were either inspired by self-praise or self-pity, and by an idealisation of themselves as the embodiment of religious truth.

Mujeeb underlined, in the spirit of liberal-left historians like Tara Chand, Beni Prasad, R P Tripathi, Mohammad Habib and K M Ashraf, the weight of composite and syncretic forces in Indian history. "If the Indian Muslim state is divested of its pseudo-religious guise", he observed, "the spirit of the political system will appear to be in accord with what is recognised as the national interest today".

He diligently traced the evolution of those ideas and movements that reinforced bonds of inter-religious unity and understanding. He concluded that there were far more convincing reasons for Hindus and Muslims to stay together than to be divided on the basis of religion. He was attracted, for these reasons, to the enlightened world view of Abul Talib, Ghalib, Syed Ahmad, Hali, Ajmal Khan and Azad, and his sympathies therefore lay with the protagonists of composite nationalism, chiefly the Congress Muslims.

The message for his generation was:
